Documentation and user information for the FORTRAN computer program WATER is given. The program is designed to retrieve and update cost information for 72 large and 27 small supply systems that were previously studied to determine their construction, operation, and maintenance costs. Cost curves developed from the study are used in WATER. The program facilitates the estimation of overall treatment plant costs as well as individual process costs. Costs determined for treatment plants are input as trains of individual processes. Costs are determined by retrieving stored coefficients for a least squares polynomial fit of the cost curves and by evaluating this for the selected process design parameters. Construction costs are in terms of October 1978 dollars and can be updated by the user by two methods. A weighted composite cost index can be computed for each process or updating can be done by use of the Engineering Record Construction Cost Index. Capital costs can be determined from construction costs by applying cost factors. General contractor overhead and profit, legal, fiscal, and administrative fees, and interest can also be generated. Three data files are needed to run the program, two set up by the user and a third contained in the manual. Examples of the two user input files are given. Other information given includes program output, examples, a trouble shooting guide, and a WATER Program listing. (Seigler-IPA)

MANGANESE REMOVAL FROM WATER BY FLOTATION WITH MICROGAS DISPERSIONS,
Rhode Island Univ., Kingston.
F. J. DeLuise.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153117, Price codes: A02 in paper copy, A01 in microfiche. Rhode Island Water Resources Center, University of Rhode Island Completion Report (1979) 18 p, 7 Fig, 1 Tab, 11 Ref. OWRT A-067-RI (1), 14-34-0001-9042.

Descriptors: *Manganese, *Flotation, *Surfactants, *Water treatment, Methodology, Hydrogen ion concentration, *Manganese removal, Water supply.

Microgas dispersions have been used in precipitate flotation to remove manganese from dilute aqueous solutions. Various surfactants were employed in both batch and continuous operating processes, with anionic surfactants, particularly DBSS, proving the most effective for manganese removal. Final concentrations of 0.06 mg/l have been achieved consistently in the continuous countercurrent process. The effects of pH, MGD dispersion rate, and solution flow rate are presented.

NITROGEN FIXATION BY THERMOPHILIC BLUE-GREEN ALGAE (CYANOBACTERIA): TEMPERATURE CHARACTERISTICS AND POTENTIAL USE IN BIOPHOTOLYSIS,
California Univ., Berkeley. Sanitary Engineering Research Lab.
K. Miyamoto, P. C. Hallenbeck, and J. R. Benemann.
Applied and Environmental Microbiology, Vol 37, No 3, p 454-458, March, 1979. 8 Fig, 1 Tab, 15 Ref.

Descriptors: *Nitrogen fixation, *Temperature, *Nitrogen fixing bacteria, *Biophotolysis, Algae, Nitrogen, Bacteria, Cyanophyta, Light intensity, Oxygen, Growth rates, Animal physiology, Microorganisms, Laboratory tests, Cultures, Hydrogen, Solar energy.

Mastigocladus Laminosus NZ-86-m, thermophilic, nitrogen-fixing blue-green algae potentially useful for practical biophotolysis application, grows well in 35-50C temperature range and exhibits high acetylene reduction activity comparable to that of Anabaena species. Three M. laminosus strains were grown in modified Allen and Arnon medium. Among the strains tested, NZ-86-m showed higher specific activity; all three were similar in temperature dependency of nitrogenase activity. NZ-86-m fixes nitrogen at temperatures up to 54C with optimum nitrogen fixation occurring at 45C. Atmospheric oxygen tension is slightly inhibitory (about 20%) to this algae regardless of growth rates. A light intensity of 10,000 ergs/sq cm s is saturating. Continuous culture for two months can occur without significant contamination problems. At an increased light intensity (30,000 ergs/sq cm s), strain NZ-86-m grows exponentially to 150 Klett units before reaching light-limited, linear growth. When sparged gas is switched from air-C02 to various argon-N2-C02 mixtures, peak hydrogen evolution rates are observed. These rates are roughly proportional to algal cell density when exponentially growing cells are used. Light energy to hydrogen gas conversion efficiency is 2.7% at the highest production rate. BEHAVIOR OF ABATE IN MICROORGANISMS ISOLATED FROM POLLUTED WATER,
Maryland Univ., College Park. Dept. of Entomology.
A. Daorai, and R. E. Menzer.
Archives of Environmental Contamination and Toxicology, Vol 5, No 2, p 229-240, 1977. 1 Fig, 3 Tab, 11 Ref.

Descriptors: *Water pollution, *Insecticides, *Pesticide toxicity, *Mosquitoes, Laboratory tests, Microorganisms, Toxicity, Radioactivity, Metabolism, Pesticide residues, Biodegradation, Degradation(Decomposition), Larvae, Larval growth stage, Chemical degradation, Path of pollutants, Organic matter, Denton(MD), Wye Mills(MD), Maryland.

Abate, an insecticide used to control mosquito larvae, seems less effective in polluted water and higher application rates are needed to control mosquito larvae. While some hydrolytic and oxidative degradation takes place, most Abate addaded to mosquito ponds is adsorbed by organic matter and then slowly released into the pond over longer

time periods. This investigation was undertaken to observe Abate metabolism by some microorganisms. Two sources of water were used: (1) A Denton, Maryland, sewage treatment plant, and (2) a spring-fed farm pond near Wye Mills, Maryland. Greater radioactivity occurred after extraction in the Denton sewage sample, which might indicate hydrolic metabolism. However, differences are probably due to effects of organic materials on Abate's solubility and extractability rather than to effects on its metabolism. Microorganisms isolated from polluted water are able to degrade Abate to a small degree. The selective isolate, Pseudomonas sp, breaks down Abate into water-soluble compounds and converts Abate into highly polar metabolites. However, amounts of degradation or metabolites produced are not sufficient to explain Abate's reduced effectiveness under these conditions, rather Abate has an apparent affinity for organic matter. This affinity is helpful in explaining mosquito larvae toxicity at very low concentrations. If Abate concentrates on mosquito larvae or on microorganisms which are fed upon by larvae, then the effective concentration near larvae is very high. (Danovich-Wisconsin)

RIVER-QUALITY ASSESSMENT--A RATIONAL SCIENTIFIC BASIS FOR POLLUTION CONTROL AND WATER-QUALITY MANAGEMENT,
C. J. Velz.
In: River-Quality Assessments; Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. p 3-10, 1978. 5 Ref.

Descriptors: *Water quality, *Water management(Applied), *Water pollution control, *River basins, Water treatment, Streams, Low-flow augmentation, Self-purification, Droughts, Tertiary treatment, Waste water treatment, Legislation, Federal Water Pollution Control Act, River-quality assessment.

Achievement of desirable river quality at acceptable costs requires that management decisions be based on sound impact assessments in each basin, not on arbitrary decisions applied on a blanket national scale. Major aspects considered in the paper are: why the Geological Survey undertook River-Quality Assessments (RQA); definition of rational RQA and other concepts; consideration of viable alternative strategies in water-quality management; and discussion of contrasts between rational-scientific approach and the current arbitrary-legalistic procedure under P.L. 92-500. Rational RQA is problem oriented. Each river basin has its unique problems and solutions, depending upon its hydrologic setting and man's use of the resources. The distinguishing element of rational RQA is that, since true cause-effect relationships are defined and verified from intensive investigations and synoptic river sampling, a scientific basis is provided for evaluating impacts on river quality by which various plans of action can be judged. In considering strategies, emphasis is given to all viable alternatives, including stream self-purification, low streamflow augmentation, and the limitations of wastewater treatment. In contrast, P.L. 92-500 is dominantly federalistic, legalistic, and arbitrary. Congress overreacted to Executive Branch abuses and to explosive pressures from new ecology groups. Basic changes in the law are in order. (See also W80-03606) (Humphreys-ISWS)

DETERMINANTS OF WATER QUALITY IN AGRICULTURAL WATERSHEDS,
Illinois Univ. at Urbana-Champaign. Dept. of Ecology, Ethology, and Evolution.
I. J. Schlosser, and J. R. Karr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153604, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Center, University of Illinois Research Report No 147. January, 1980. 81 p, 29 Fig, 1 Tab, 39 Ref, 3 Append. OWRT A-093-ILL(1).

Descriptors: *Agricultural watersheds, *Channel morphology, *Nonpoint pollution, *Riparian plants, *Suspended solids, Illinois, *Water quality, Phosphorus streams, Turbidity, Model studies, Rainfall-runoff relationships.

Water quality was monitored for 17 months in six different agricultural watersheds in east central Illinois to evaluate the impact of alterations in riparian vegetation and channel morphology. Sampling was conducted during both base flow and runoff periods. The results indicate that the relevant theory for enhancement of water resources and for modelling water quality in agricultural watersheds varies depending on flow conditions. During base flow, emphasis should be placed on linking hydrological theory of instream transport of inorganic material to biological theory of production and transport of organic material. Peak levels of all parameters are reached during the summer period of increased biotic activity. Concentrations of suspended solids remain relatively constant, and seasonal dynamics of phosphorus and turbidity appear to be controlled by leaf inputs in fall. During runoff events, a simple model based on the KLS factors of the Universal Soil Loss Equation accurately predicts spatial patterns of suspended solids, turbidity, and phophorus levels in watersheds with a uniform channelized stream well protected stream banks, and cultivation to the stream edge. The model was not an accurate predictor where heterogeneity in riparian vegetation and channel morphology existed. Suspended solids concentrations were greater than predicted in areas where unstable (fine) substates occur and potential energy of the stream is high due to removal of riparian vegetation and creation of a uniform and straight channel.

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

THE ANTICIPATED DECISION INFLUENCE PERIOD IN REAL TIME RESERVOIR OPERATION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
L. A. W. Anderberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-151301, Price codes: A04 in paper copy, A01 in microfiche. PhD Dissertation, 1979. 50 p, 9 Fig, 13 Ref. OWRT B-195-COLO(1), 14-34-0001-9060.

Descriptors: *Reservoir operation model, *Reservoir release decisions, Reservoir release policy, *Reservoir storage, Reservoir yield, Optimum hydropower production, Power production, Hydroelectric power, Water supply, *Reservoir operation, Decision making.

A reservoir is a physical mechanism that provides a potential to turn an unreliable source of water into a dependable water supply system. A set of rules and the reservoir operator's skill and experience are supposed to utilize the potential of the reservoir such that the predetermined objectives of the sytem are carried out in the most beneficial way. The rules for operation should ideally trade off immediate benefits against future benefits to be expected such that both the needed assurance of water and/or power is provided for and the potential of the reservoir is utilized most efficiently. Present practice in reservoir operation provides the assurance implicitly by means of the Critical Period, but has no explicit mechanism to improve the efficiency of operation. In order to be able to employ a mechanism to trade off immediate benefits against expected future benefits, a time frame over which the total benefits intermediate decisions and their associated risks can be explicitly evaluated has to be recognized. This dissertation presents a logic for such a time frame, called the Anticipated Decision Influence Period, ADIP. Within this context an analysis and discussing of responsive and flexible reservoir operation rules to guide the operator in the decision-making process. It is suggested that currently used Rules Curves can be favorably substituted by Operational Equations in order to enhance flexibility.

AN INTERACTIVE RIVER BASIN WATER MANAGEMENT MODEL: SYNTHESIS AND APPLICATION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. M. Shafer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153547, Price codes: A10 in paper copy, A01 in microfiche. Colorado Water Resources Research Institute, Colorado State University Technical Report No 18, August 1979. 246 p, 42 Fig, 36 Tab, 58 Ref, 5 Append. OWRT A-039-COLO(3), 14-34-0001-8006.

Descriptors: *Simulation, *Water supply, River basins, Network analysis, *Interbasin water transfers, Streamflow, Reservoir storage, Water management, Water conveyance, Computers models, Model studies, Gache la Poudre River.

A computer model is presented for quantifying the impacts of multipurpose water management policy. the model is designed for the analysis of water availabilities throughout a river basin over extended time periods. It is capable of simulating the monthly storage, flow, and diversion of water in a

complex river basin system. The prototype system is represented in the model by a network of interconnected nodes which characterize the reservoirs, tributary inflow points, and diversion points in the basin. Linkages between nodes represent the conveyance morphology of the basin. The model, MODSIM, is synthesized from previously existing models. A base or core model is selected from these models, and further modified so as to better conform to the attributes and capabilities considered desirable for the model. An advantage of the model is its optimizing capability with respect to reservoir operating rules. Also, MODSIM is able to simulate institutional dictates governing water allocation, such as water rights priorities. Conveyance losses and return flows resulting from irrigation practices can also be considered by MODSIM. MODSIM is interfaced with an interactive conversational data management package. Conversational programming facilitates the rapid analysis of management alternatives, and promotes the successful transfer of this technology to water planners and managers with little background in computer programming. Two case studies are presented which demonstrate the utility of MODSIM for aiding in the analysis of impacts of long-term changes in water resource management within a river basin. The Cache la Poudre River Basin in north-central Colorado is used for both case studies.

GEOPHYSICAL AND HYDROLOGIC PREDICTION OF FISSURING AND LAND SUBSIDENCE, SOUTH-CENTRAL ARIZONA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
J. K. Boling, M. C. Carpenter, and S. N. Davis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-151434, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona, Project Partial Completion Report, January 1980. 43 p, 11 Fig, 46 Ref, 3 Append. OWRT A-073-ARIZ(2), 14-34-0001-7005, 7006 & 8003.

Descriptors: *Fissures(Geologic), *Land subsidence, Movement, Forecasting, *Arizona, Structural geology, Pumping, Groundwater, Drawdown, Measurement, Dial gauges, Signal peak(Ariz), Picacho Mountains(Ariz), Avra Valley(Ariz).

Bimonthly horizontal strain measurements of fissures have been made at 7 dial gages near Signal Peak, Picacho Mountains, and in Avra Valley, AZ. A Pyrex glass rod is fixed on one side of a fissure and pushes against a dial gauge fixed to the other side. Installations are in shallow covered trenches. Movements ranging from 5 mm to 25 mm are detected with a measurement error of less than 5 mm. Fissures have been observed to open and close repeatedly. With one exception, old and new cracks showed no pronounced difference in character. The max. opening rate was 4.1 mm hr-1 over a 17-day period, and the max. closing rate was 5.0 mm hr-1 over a 14-day period. Following a severe storm, one fissure abruptly opened 31 mm within a 14-hour period while one nearby parallel fissure opened 1.6 mm and another nearby parallel fissure closed 2.1 mm. Transducer measurements of horizontal movements across fissures of up to 4 hours' duration were made with a resolution of 10 nm. Simultaneous measurements of horizontal linear strain in nearby unfissured soils provided controls. In Avra Valley, the greatest rate of fissure closing was 8.7 um hr-1 across a span of 95 cm, while the control installation exhibited a compressive strain rate of 2.3 x10-6 hr-1. The greatest rate of fissure opening was 3.8 um hr-1 over an 86 cm span while the control dilated 0.43 x 10-6 hr-1. At a breached section of McMicken Dam, the greatest opening and closing rates were 6.0 um hr-1 and 10 um hr-1 over a 76 cm span. At both locations, the fissure movement and control strain were mostly in the same sense and the movement was smooth. Correlation of fissure movement, rainfall, pumping and water level fluctuations indicates major earth fissure movements will occur after high pumping rates during or shortly after large storms. Long term records will form the data base for predictive models of subsidence and earth fissuring.

Descriptors: *Water resources development, *Planning, *Investment, *Institutions, *Probability, Reservoirs, Economics, Water quality control, Flood control, Political aspects, Water supply, Flood frequency, Resilience, Robust statistics, Technological uncertainty, Optimal design, Model complexity, Institutions, Nearly optimal decisions, Connecticut River.

Three parallel threads are studied. One introduces system resilience into assessment of water-resource projects. It takes specific account of the time - dependent response of water-resource systems to major changes in supply, demand and extreme events. The notions of time-to-failure and time-between-failures are introduced. A new density function, the Wakeby, is introduced for flood frequency analysis; it is shown to have important properties of robustness. A calculus for decision-making under uncertain technology is shown to lead to resilient decisions. The second thread emphasizes institutional resilience by noting that problems have an optimal complexity associated with their size (i.e., the numbers of variables and of constraints) and with institutional considerations which promulgate near-optimal solutions as useful alternatives to global optima (which might be only marginally superior in terms of the stated objective function). The third portion is a systematic appraisal of optimal and near-optimal solutions to systems of modest size, with emphasis on strategies for capacity expansion. It is shown that many near-optimal solutions are often very close to the global optimum, frequently within the error attributed to noise in the parameters of the optimum. The axiom that optimality should always be sought is shown to be indefensible. An example is run on a model river basin.

6B. Evaluation Process

RIVER-QUALITY ASSESSMENT: CONCEPT, FRAMEWORK, AND APPLICATION IN THE WILLAMETTE RIVER BASIN, OREGON,
Geological Survey, Portland, OR.
D. A. Rickert.
In: River-Quality Assessments; Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. p 11-21, 1978. 2 Fig, 18 Ref.

Descriptors: *Water quality, *River basins, *Oregon, *Decision making, Planning, Programs, Management, Project purposes, Analytical techniques, Mathematical models, Water pollution, Pollutants, Dissolved oxygen, Metals, Assessments, Priorities, Hydrology, Forecasting, *Willamette River Basin(OR), Assessment framework, River-quality assessment.

The U.S. Geological Survey recently (1976) completed an intensive river-quality assessment in the Willamette River basin, Oregon. The major objectives were to (1) define a practical framework for conducting river-quality assessments that will provide a sound technical basis for decision makers to use in evaluating planning and management alternatives, and (2) apply the framework to assess existing or potential river-quality problems of the Willamette River basin. The most noteworthy finding of the assessment was that across-the-board advanced waste treatment is not the answer to the problem of meeting stringent water-quality standards established for the Willamette River. The implication of this finding is that rigid nationwide standards and regulations are likely to result in unneeded expenditures in some river basins and in unachieved standards in others. The assessment also found that existing water-quality data collected under monitoring- and surveillance-type programs are inadequate for defining the critical cause-effect relationships that control river-quality problems. Intensive, synoptic surveys specifically designed to assess local problems and conditions are required to provide an adequate information base for making key management decisions. Perhaps the three most important questions that need to be asked at the beginning of each study are: (1) Have the relevant problems been delineated. (2) What types and intensities of data collection are needed to provide a technically sound assessment. (3) How much time is needed to provide information that is adequate for decision making. The ultimate success of resource assessment is largely determined by its initial formulation. Careful answers to these questions, together with thoroughly defined objectives, will provide a sound start to each new assessment. (See also W80-03606) (Humphreys-ISWS)

RESIDUALS MANAGEMENT: A TOOL IN RIVER-QUALITY ASSESSMENT APPLIED TO COAL DEVELOPMENT IN THE YAMPA RIVER BASIN, COLORADO,
Geological Survey, Reston, VA.
R. M. Hirsch, I. C. James, II, and J. E. Schefter.
In: River-Quality Assessments; Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. p 142-164, 1978. 3 Fig, 7 Tab, 17 Ref, 1 Append.

Descriptors: *River basins, *Colorado, *Long-term planning, *Model studies, *Regional analysis, Planning, Water utilization, Coals, Costs, Economics, Industrial plants, Consumptive use, Management, Thermal powerplants, Resources development, *Yampa River Basin(CO), Coal development, Plant-level models, Regional models, Coal gasification, Electric power generation.

Residuals management provides a basis for projecting the effects of economic development on the discharge of residuals to the environment and on the use of water. It is a useful technique of river-quality assessment for basins wherein substantial

economic growth is either occurring or expected. Residuals management techniques were utilized to assess the effects of coal development and utilization in the Colorado part of the Yampa River basin. Plant-level models were used to describe the material and energy balances and the operating costs of surface mining of coal, the Synthane process of coal gasification, coal-fired thermal-electric generation of power transportation of coal by coal-slurry pipeline, and transportation by unit train. As part of the model of electric power generation, four alternative methods of cooling are considered: once-through cooling, cooling ponds, wet cooling towers, and dry cooling towers. Each of these models provides estimates of water withdrawal, water consumption, and residuals generated directly by the particular process involved. An economic input/output model of the study was used to predict the total growth of the regional economy under four coal-development scenarios. The amount of coal assumed to be mined is constant across all of these, but each of them assumes a different use of the 'new' coal: gasification, electric power generation, coal-slurry pipeline export, or unit train export. The plant-level models are linked with the input/output model to provide estimates of total (direct and indirect) water use and residuals generation in the regional economy under the four scenarios. A CULTURAL RESOURCE SURVEY OF THE TETON REPLACEMENT FARMLAND, JEFFERSON COUNTY, IDAHO,
Commonwealth Associates Inc., Jackson, MI.
J. G. Franzen.
Final Investigative Report No R-2092, Volume I, submitted to USDI Water and Power Resources Service, January 1980. 70 p, 2 Fig, 4 Tab, 33 Ref, 2 Append.

Descriptors: *Idaho, *Archaeology, *Dating, *Agriculture, *Flood damage, Surveys, History, Land use, Farms, Irrigation practices, Sands, Silts, Arid lands, Teton Dam(Idaho).

An intensive survey was conducted to evaluate the historic and cultural properties of 3200 acres of land along Idaho State Route 33 that is to be sold to farmers as replacement farmland for lands damaged by flood waters when the Teton Dam failed. The area is located on the Snake River Plain and is part of the Columbia Intermontane Physiographic Province. Dunes of sand and silt dominate the topography of the area. The land is semi-arid (7.5 in/year rainfall), has low humidity, a large temperature range, and large yearly variations in seasonal conditions. For the survey parallel transects were walked over the entire area at approximately 30 meter intervals. Test excavations were performed at three sites where subsurface deposits were indicated and all soil was screened through 1/4 inch hardware cloth. The survey located 25 archeological sites and 56 isolated artifact finds. Of these 22 sites with chipped stone tools, debitage, and faunal materials were dated to the pre-historic period. These prehistoric sites may be related to the procurement and processing of bison, antelope, or grass seeds. Site descriptions are given for each of the 25 archeological resource areas. Due to the destructive nature of planned irrigated agriculture in the area a program of mitigation is recommended for controlled surface collection and functional-spacial analysis. (Seigler-IPA)

STREAM TYPES IN IDAHO: AN APPROACH TO CLASSIFICATION OF STREAMS IN NATURAL AREAS,
Idaho Univ., Moscow. Dept. of Biological Sciences.
N. L. Savage, and F. W. Rabe.
Biological Conservation, Vol 15, No 4, p 301-315, June, 1979. 5 Fig, 6 Tab, 23 Ref. OWRT A-046-IDA(3).

Descriptors: *Streams, *Classification, *Idaho, Gradient, Flow characteristics, Substrate, Wetlands, Aquatic plants, Aquatic animals, Aquatic habitat, Biological communities, Physical properties.

A preliminary classification for unaltered low order streams in Idaho consists of ephemeral streams, which contain water only during periods of high runoff; spring streams, formed where groundwater aquifers discharge as surface springs; and three types of permanent streams. Key features used to designate stream type are order, gradient, pattern of flow, and substrate--all of which are readily identifiable, nonvariable characteristics. Type designation is supported on an ecological basis by analysis of extensive collections of aquatic plants and invertebrates. (Howard-Mass)

CHESAPEAKE BAY FUTURE CONDITIONS REPORT, APPENDIX 3. ECONOMIC AND SOCIAL PROFILE.
Baltimore District, U.S. Army Corps of Engineers, Baltimore, Maryland, Corps of Engineers, Baltimore, MD. Baltimore District.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A052 473, Price codes: A14 in paper copy, A01 in microfiche. Interim report, December 1977. 296 p, 27 Fig, 143 Tab.

Descriptors: *Regional economics, *Regional analysis, *Chesapeake Bay, *Forecasting, *Social aspects, Regional development, Water requirements, Economic impact, Economic prediction, Economics, Regions, Human population, Urbanization, Land use, Recreation, Water demand, Navigable waters, Water pollution sources, Water supply, Waste water treatment, Growth rates.

As one of 16 supporting appendices to the second part of a three-phase comprehensive study of Chesapeake Bay, the present document provides an economic and social history of the region, describes population characteristics, analyzes the main economic standard industrial classification sectors, and derives economic and demographic projections through standardized models developed for sub-national areas. Chesapeake Bay Region, heavily urbanized today, forms the southern portion of the Boston-Washington megalopolis considered widely to be the economic center of the U.S. With a population that has doubled since 1940 to about 8 million, the Bay region is expected to double in population growth once again by 2020, with more than 50% of this projected to take place in the Washington D.C. subregion. Almost 3.3 million persons were employed in the Bay region in 1970, with 6.8 million projected by 2020. Although less than 10% of the land is developed, nearly 80% of the population live in urban areas. Land use is characterized by: (1) increasing industrial demands for processing and cooling water; (2) water-based recreational facilities and opportunities outstripped by booming demand; (3) adverse impacts brought about by expansion of navigational facilities to keep pace with economic expansion; (4) continued pollution and sedimentation of region waterways as a result of construction, industrial effluents, storm runoff and municipal discharges; and (5) shortage of adequate water supply and waste treatment facilities. Descriptors: *Demand, *Willingness-to-pay, *Estimating, *Decision making, *Social aspects, *Political aspects, Economics, Public sector, Estimating equations, Curves, Theoretical analysis, Social change, Social values, Social needs, Governments, Economic impact, Risks, Analytical techniques, Political constraints, Institutional constraints.

Demand-revealing methods for public goods must meet minimum standards of intelligibility and quality control in order for experiments and other applications of direct decision making in society to be acceptable to government. If standards are not met, politicians and ordinary people will not be convinced that public choice by direct, demand-revealing methods represents an improvement over previous choice methods. Demand-revealing methods are relevant whenever government cannot reach a well-founded decision, that is, in highly controversial cases or in cases involving important matters of principle. Demand-revealing methods should not be used in everyday political decision making. Economic incentives may or may not influence responses with respect to issues of high moral content. Uncertainty basically remains as to whether economic incentives will dominate or be dominated by other incentives. It is important to look for demand-revealing mechanisms with no incentives for misrepresenting preferences. Judgements must be made regarding whether bias is absent in a particular application, not only in principle but also in a laboratory setting. (Danovich-Wisconsin)

HEDONIC PRICES, PROPERTY VALUES AND MEASURING ENVIRONMENTAL BENEFITS: A SURVEY OF THE ISSUES,
Bowdoin Coll., Brunswick, ME.
A. M. Freeman, III.
Scandinavian Journal of Economics, Vol 81, No 2, p 154-173, 1979. 3 Fig, 37 Ref.

Descriptors: *Benefits, *Prices, *Theoretical analysis, *Analytical techniques, *Property values, Economics, Demand, Willingness to pay, Curves, Environment, Equilibrium prices, Mathematical models, Utility, Supply, Equations, Air pollution, Cities.

Hedonic price techniques for estimating benefits work about as well or as poorly as any empirical technique for estimating economic functions. Hedonic technique assessment involves substantial simplification and abstraction from complex reality. Assumptions are never completely realized in practice. Criticisms raised against these techniques can be raised against any economic empirical work: data are inadequate: variables are measured with error; and variable definitions seldom correspond precisely to theoretical constructs. This paper reviews the theoretical basis and assumptions of hedonic price equations derived from property value data to obtain prices and inverse demand functions for environmental amenities such as air quality. Review involves two separate and conceptionally distinct steps: using the hedonic price equation to estimate marginal implicit characteristic prices, and using these implicit prices to estimate inverse demand functions or marginal willingness to pay functions for household groups. Results from more than a dozen studies assessing

air, water quality and urban noise problems, indicate the model has substantial explanatory power with respect to housing prices. (Danovich-Wisconsin)

WHAT CAN WE GET FROM EFFLUENT CHARGES,
C. S. Russell.
Policy Analysis, Vol 5, No 2, p 155-180, Spring, 1979. 1 Tab.

Descriptors: *Effluents, *Pollution taxes(Charges), *Economic efficiency, *Policy, Economics, Political aspects, Regulation, Federal government, Discharge(Water), Water quality standards, Marginal costs, Benefits, Economic growth, Technology, Taxes, Decision making, Environment.

This paper discusses effluent charges as environmental policy instruments and advocates trading effluent charges efficiency for a simpler system, retaining dynamic incentive effects that are the major positive attributes of charges. Statically efficient charges are information-intensive and most vulnerable to litigation delays. If charges are viewed as policy targets, static efficiency is not meaningful. If charge levels are set by Congress, political considerations are central to levels chosen and little is gained by legal challenges. If charge levels are chosen by The U.S. Environmental Protection Agency, information is required to justify technical decisions. Political pressure and bargaining are important at every stage; legal challenges may involve successful delays in implementation. Over the long-run, any charge system spurs firms and public bodies to search for better and cheaper ways to avoid discharging pollution into air and water. A realistic and potentially useful policy would be to combine part of the existing regulatory apparatus with nationally uniform effluent charges covering all significant pollutants. In addition, all discharges would be subject to national effluent charges, creating continuing incentives for developing and adopting environment-saving innovations. This policy is roughly consistent with the charges-as-targets position; such a course would not produce economic efficiency in the static sense of minimum pollution expenditures for attained ambient quality levels. (Danovich-Wisconsin)

FINANCIAL STATEMENT MODELING: ANALYZING THE POLLUTION-CONTROL TAX INCENTIVE,
L. A. Nikolai, R. Elam, and B. Bozeman.
Policy Analysis, Vol 5, No 2, p 243-254, Spring, 1979. 2 Fig, 3 Tab.

Descriptors: *Policy, *Pollution taxes(Charges), *Financial feasibility, *Investment, Mathematical models, Economics, Statistical methods, Statistics, Taxes, Pollution abatement, Legislation, Regulation, Tax rates, Depreciation, Amortization, Capital, Industries, Cost-benefit analysis, Economic justification.

Financial statement modeling, used to evaluate congressionally mandated pollution-control tax incentives, concludes that such tax incentives are ineffective. On an investment of $900,000, the maximum total present value tax savings amounts to less than $60,000 for a manufacturing firm investing in a facility with a 26-year life. The Internal Revenue Code includes provisions for investment credit, bonus depreciation, and certified pollution control facility accelerated amortizations to stimulate capital expenditures. Financial statement modeling is an approach to policy analysis which employs financial data and evaluates alternatives in terms similar to cost-benefit analysis, but financial statement modeling is rooted in concepts used by accountants rather than economists. It is a useful modification of cost-benefit analysis and yields sufficiently different results. Current tax provisions are ineffective for several reasons: (1) Due to rapidly improving pollution control technology, firms given a choice between comparable short and long-term alternatives usually opt for the short-term facility. (2) Allowable asset time spans for selected high environmental impact industries are less than those necessary to make tax incentives financially attractive. (3) Tax deductions are not sufficient to justify trying to get facilities certified by the appropriate pollution control agency. (4) Tax provisions tend to discriminate against extractive firms. (Danovich-Wisconsin)

THE ANALYSIS OF RISK IN IRRIGATION PROJECTS IN DEVELOPING COUNTRIES,
University of East Anglia, Norwich (England). School of Developmental Studies.
I. Livingstone, and A. Hazlewood.
Oxford Bulletin of Economic and Statistics, Vol 41, No 1, p 21-35, February, 1979. 4 Fig, 1 Tab.

Descriptors: *Economics, *Irrigation, *Developing countries, *Water supply, *Risks, *Economic efficiency, *Optimization, Water resources, Equations, Curves, Water shortage, Water management(Applied), Agriculture, Irrigation design, Irrigation systems, Irrigation water, Irrigation efficiency, Marginal utility, Capital, Investment, Social aspects.

Fluctuating water availability is an issue which arises in planning irrigation schemes in developing countries due to differences in rainfall. A recognized rule-of-thumb in engineering practices recommends that the volume of water assumed for planning purposes should be available in four years out of five. Only in one year out of five will water be insufficient for installed capacity. Such a rule provides an optimal solution only in particular circumstances and its general application is inconsistent with standard net present value criterion for evaluating alternative investment projects. These rules should be determined, not on technical, but on economic and social grounds. A large mechanized farm may not accept frequent serious water deficiency, involving large financial losses. However, it is different for village irrigation with peasant production. If peasant farmers are poor with low incomes and food supply, they attach high values to extra output, even if available only in better years. Denying cultivators the full benefits of high river flow years so as to reduce risks of doing relatively worse in other years is not important. If crop storing is possible, a larger area could produce extra food in good years to be used as a reserve against subsequent crop failure. Therefore, the optimum solution shows that peasant farmers may follow a less cautious policy than a large mechanized farm. (Danovich-Wisconsin)

ENVIRONMENTAL PROTECTION FOR WHOM,
Hampshire Coll., Amherst, MA. Dept. of Political Science.
S. P. Shapiro.
Social Policy, Vol 10, No 1, p 24-28, May-June 1979. 23 Ref.

Descriptors: *Environment, *Political aspects, *Leadership, *Psychological aspects, *Pollution abatement, Political constraints, Natural resources, Economics, Employment opportunities, Under-employment, Welfare(Economics), Social participation, Social aspects, Water policy, Water resources development, Income distribution, Conservation, Decision making.

Resource conservation and environmental protection are commonly perceived as elitist movements with leadership made up of wealthy primitivists and other persons unconnected to and unconcerned with the basic needs and concerns of most of the working class of the United States. A paradox is that environmentalism has been a highly divisive issue, driving a wedge between the often tenous alliance of labor and middle-class liberals and excluding those for whom pollution poses the greatest threat: the urban working poor, miners, etc. At the same time, environmental policy is also seen as a 'safe' issue--unlikely to upset or even challenge the existing political and economic structures within the United States. Its concern is mainly for those with the least interest in any major change in American society. Forgetting that any justification for less growth is necessarily a justification for existing levels of inequality in this country, many Americans find themselves caught between two apparently impossible extremes on environmental issues. First, success of the movement may be costly in terms of jobs and economic well-being so as to cause a severe backlash; and hard-core environmentalists readily take on an elitist cast, as their myopia about social conditions at times suggests more concern with aesthetics than people and jobs. Second, the environmental movement provides industry with potential political allies of organized labor and the poor, in its struggle against more effective environmental legislation. ADAPTIVE ECONOMICS AND NATURAL RESOURCES POLICY,
University of Southern California, Los Angeles. Dept. of Economics.
R. H. Day.
American Journal of Agricultural Economics, Vol 60, No 2, p 276-283, May 1978. 29 Ref.

Descriptors: *Economics, *Natural resources, *Decision making, *Adaptation, Federal project policy, Water allocation(Policy), Water distribution(Policy), Water policy, Administration, Management, Economic justification, Methodology, Optimization, Equilibrium, Environmental effects, Planning, Behavior, Economic efficiency, Systems analysis.

An approach to economics differing sharply from (but closely related and complimentary to) optimality and general equilibrium theory is presented which has special relevance to natural resources policy. Adaptive economics is based on the following postulates of human behavior: (1) Economic activity changes the environment in which further activity is conceived and executed: results of this activity, such as resource exhaustion or irreversible environmental effects, may be far more consequential than the setting in which it takes place. (2) Economizing is carried out by agents who are partially informed, have limited memory and computational powers, and who make only imperfect forecasts of the effects of their choices. (3) Current knowledge derives from only past system operation. (4) Economic activity, including planning, takes time; delays interfere with plans, actions and consequences. (5) Plans and behavior are imperfectly coordinated, so that economic behavior takes place out of equilibrium. Adaptive economics is primarily a study of how economies shift in disequilibrium and secondarily whether or not, and if so, how equilibria or adaptedness states are achieved. Adaptive models will produce surprises in the evolution of economic activity whose exact timing and magnitude defy prediction. Instead of focusing on economic efficiency, natural resources policy should be aimed at preparing for surprises and not on predicting them--perhaps a contradiction in terms. What is needed is slack: surplus resources, redundancies, expectation of less than maximal growth, operational delays, and procedural mistakes. (Harris-Wisconsin)

ENVIRONMENTAL MANAGEMENT IN GENERAL EQUILIBRIUM: A NEW INCENTIVE COMPATIBLE APPROACH,
Mannheim Univ. (Germany, F.R.).
R. Pethig.
International Economic Review, Vol 20, No 1, p 1-27, February 1979. 2 Fig, 23 Ref.

Descriptors: *Economics, *Environment, *Resource management, *Pollutants, *Mathematics, Mathematical models, Production, Equations, Equilibrium, Theoretical analysis, Curves, Mathematical studies, Optimization, Governments, Resource allocation, Competition, Welfare(Economics).

Main results of applying the Groves-Ledyard mechanism to environmental management are an existence theorem of competitive equilibrium relative to incentive-compatible environmental management and two Fundamental Welfare Theorems for pollution economy. The Groves-Ledyard con-

struction does not address or resolve some major informational problems involved with pollution; its main purpose is to elicit correct information on consumer preferences. Environmental management is studied only in a static general equilibrium model. Firms and consumers produce private goods, some of them being undesired by-products. Residual waste products are defined as private goods in aggregate excess supply, a satisfactory micro-economic basis for explaining pollution. A central part of the model is the pollution function which is viewed as the economy's production function for public goods. If spatial and temporal interpretation of commodity space is adopted, pollution function knowledge is an important informational problem in environmental economics. Consumers are concerned only about pollution levels and not about residual allocations which lead to these levels; therefore, only government has complete information on the pollution function. However, knowledge of the pollution function does not exhaust Groves-Ledyard mechanism informational feasibility with environmental management issues. (Danovich-Wisconsin)

SYSTEMS ECOLOGY, PEOPLE ECOLOGY, AND THE ANTHROPOLOGY OF FISHING COMMUNITIES,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Human Ecology and Social Sciences.
B. J. McCay.
Human Ecology, Vol 6, No 4, p 397-422, December 1978. 2 Tab, 98 Ref.

Descriptors: *Commercial fishing, *Economics, *Social impact, *Anthropology, *Social adjustment, *Behavior, Fisheries, Marine fisheries, International waters, Fogo Island, Newfoundland, Canada, Social aspects, Social change, Social needs, Social values, Employment, Social mobility, Ecology, Political aspects, Employment opportunities, Under-employment, Unemployment, Adaptation, Fish management, Systems analysis.

Data from research among fishermen of Fogo Island, New foundland are used to explore 'people ecology', an alternative to marine anthropology which emphasizes people in place of systems as starting points for study, and underscores the role of larger political and social processes which affect local fishermen. During a period of local fishery decline, two general adaptive strategies were observed among Fogo Islanders. Diversification as one strategy involved broadening alternatives both within fishing and between fishing and other modes of making a living. This adaptive strategy appears to have been the most general and traditional approach, and characterized responses to individuals and households to a fisheries decline in the early 1960s. However, as environmental and economic problems continued and worsened, many people began to adjust in ways which involved intensification of response: going on welfare, becoming wage laborers, leaving the island, or dropping their independent status to team up in larger boats to remain in commercial fishing. However, the shift from diversification to intensification strategies on Fogo Island cannot be viewed simply in relation to the local natural environment. Similarly observed shifts from individual to group units of purposive action was simulated by the involvement of 'outsiders' in local matters and made possible by the structural dependency of small Newfoundland outport communites on the Canadian government. GUIDELINES FOR SOCIOECONOMIC IMPACT ANALYSES OF ENVIRONMENTAL REGULATIONS,
North Carolina State Univ. at Raleigh. Dept. of Economics and Business.
D. Hargett.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-149263, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Institute of The University of North Carolina, Raleigh, Rpt No 149, Dec 1979. 68 p, 15 Fig, 7 Tab. OWRT A-101-NC(2), 14-34-0001-8035.

Descriptors: *Cost-benefit analysis, *Regulations, *Decision-making criteria, Net present value, Internal rate of return, Water quality, Recreation, Flood control, Welfare maximization, Sensitivity analysis, *Water utilization, Cost-benefit, *North Carolina, Socio-economic impact analysis, Decision-making, Criteria, Economics, Water resources.

This report presents a brief description of socioeconomic impact analyses for noneconomists. Emphasis is given to the concept of economic efficiency or to the use of socioeconomic or benefit-cost analysis to enhance state and national income. Economists have not been very successful at conveying their ideas concerning benefit-cost analysis to noneconomists. One reason is a lack of consensus among economists on certain aspects. Aspects of benefit-cost analysis that are particularly troublesome for noneconomists are stressed. Some of these include: marginal analysis of welfare maximization, normalized pricing, estimations of willingness to pay, economics of information, and the social rate of discount. Examples are briefly described, and references are offered to several publications that have had the same purpose. (Kiger-NC)

FISHERMEN'S REMUNERATION SYSTEMS AND IMPLICATIONS FOR FISHERIES DEVELOPMENT,
Rhode Island Univ., Kingston.
J. G. Sutinen.
Scottish Journal of Political Economy, Vol 26, No 2, p 147-162, June 1979. 2 Fig, 1 Tab, 11 Ref.

Descriptors: *Commercial fishing, *Income distribution, *Risks, *Theoretical analysis, *Resources development, Economics, Fishing, Income, Equations, Investment, Labor, Capital, Employment, Wages, Payment, Fish harvest, Mathematical models, Competition, Water resources development, Fisheries.

Theoretical economic analysis demonstrates that the share system of remuneration makes a significant contribution to fishing industry development. This paper describes conditions under which the share system of remuneration is preferred by relevant parties in the fishing industry and examines implications for fisheries development. The theory argues that competitive labor markets set the level of welfare for marginal fishermen; they are neither better nor worse off under any other remuneration system. Also, if share systems are abolished and replaced by wage systems, the total number of fishermen and their individual incomes would decline. Fishing entrepreneurs are better off with the share system. It allows spreading some risk among the crew, thus reducing risk-bearing costs and providing work incentives which makes it less costly to extract desired work from the crew. Since unit costs are lower under share systems, output and input utilization levels should be greater than under wage or remuneration systems. An entrepreneur's incentive to invest is not mitigated as long as competitive markets prevail. Competitive markets allow for changes in remuneration arrangements to accomodate new capital equipment additions. Changes can involve the fixed payment, share, or both. (Danovich-Wisconsin)

IMPACTS OF THE WESTERN DROUGHT ON THE REGIONAL ELECTRICITY SITUATION.
Available from the National Technical Information Service, Springfield, VA 22161 as FEA-G-77-360, Price codes: A08 in paper copy, A01 in microfiche. Joint Staff Report: Federal Power Commission and Federal Energy Administration, September 30, 1977. 81 p, 2 Fig, 10 Tab, 8 Append.

Descriptors: *Droughts, *Hydroelectric power, *Pacific Northwest U.S., *Water conservation, *Water policy, *Long term planning, Regulation, Hydrologic budget, Low flow, Rationing(Water), Water shortage, Hydroelectric plants, Pacific Coast region, Idaho, Oregon, California, Washington, Canada, Water distribution(Applied), Water management(Applied), Regional analysis, Regional development.

Drought conditions during winter 1976-77 decreased the ability of some hydroelectric plants in the Pacific Northwest to produce sufficient electric energy; effects are especially notable in the area of the Northwest Power Pool (NWPP) serving parts of 14 states and western Canada, where 66.3% of winter energy is from hydroelectric facilities. Projected electrical demand and supply relationships are given. While the outlook for NWPP is dependent on precipitation during fall and winter months, it is unlikely that existing water shortfalls can be replenished although increased precipitation may alleviate problems in some subareas. Short-term recommendations include: (1) Federal and state agencies must adopt and implement strong conservation measures and continuously monitor the drought. (2) Federal drought programs should be continued year-round in NWPP. (3) Programs to minimize impacts on agriculture, fish and wildlife should take precedence over minor losses in electric generation. Long-term recommendations center generally on extended efforts to promote electric energy conservation, but other specific measures are also advised: (1) A direct current power line should be constructed between Arizona and Oregon for greater future

exchange flexibility. (2) The Bonneville Power Administration should make provision for passing on thermal costs significantly greater than usual. (3) Legislation is needed for electrical energy emergency allocations. (4) The appropriateness of increasing interconnections between eastern and western U.S. bulk power systems should be examined. (Harris-Wisconsin)

6E. Water Law and Institutions

PUBLIC WATER SUPPLIES: THE EFFECT OF FEDERAL AND TENNESSEE WATER RESOURCE LAW,
East Tennessee State Univ., Johnson City.
V. A. Sikora.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-149271, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research center, University of Tennessee, Knoxville, Research Report No 72, December 1979. 87 p, 6 Tab, Append. OWRT A-055-TENN(1), 14-34-0001-9045.

Descriptors: *Water law, *Water rights, Riparian rights, Common law, Judicial decisions, Water policy, Water supply, *Tennessee, *Federal-State water rights conflicts, Eminent domain.

The water law in Tennessee was determined by a legal evaluation of Tennessee statutes and cases as they affect Tennessee's water supplies. Once the existing law was determined, it was evaluated for its effect upon securing adequate water supplies for public water systems. The opinions of public water suppliers were obtained by means of a questionnaire which was mailed to all Tennessee public water suppliers. The study has determined, first, under both common law and Tennessee statute public water suppliers have nearly the same ability as other persons to acquire water rights. In addition, public water suppliers have ample eminent domain power delegated to them to acquire property and water rights. Second, public water suppliers under Tennessee riparian doctrine appear to have a priority over other withdrawers from a watercourse. In conflicts between withdrawal uses and instream uses both parties seem to be required to follow the correlative rights doctrine except for navigational uses which seem to dominate all other uses, including withdrawal uses. Third, public water suppliers favor a state water resource management program operated by a public health agency. Most suppliers saw a decline in the reliability of their primary water source in the next 20 years. Fourth, the Tennessee court cases on water law are 50-100 years old and based on problems in a culture which no longer exists. There are many substantial and significant gaps in the case law which could be filled by appropriate legislation. And finally, federal law and agencies have a pervasive, though not exclusive, roll in management of water in Tennessee.

LIABILITY FOR OIL POLLUTION - UNITED STATES LAW,
Glassie, Pewett, Beebe and Shanks, Washington, DC.
A. I. Mendelsohn, and E. R. Fidell.
Journal of Maritime Law and Commerce, Vol 10, No 4, p 475-496, July 1979.

Descriptors: *Oil pollution, *Oil spills, *Federal Water Pollution Control Act, *Water pollution control, Environmental effects, Water law, Federal government, Legal aspects, Oil industry, Oceans.

Few areas of law are as complex as that governing liability for oil pollution. The subject involves principles of tort law, largely judge-made admiralty doctrines, legislative enactments, and international conventions. The interplay of federal and state law provides further complexity. Perhaps the greatest difficulty may be the lack of comprehensive federal legislation. There are several federal statutes that are relevant to oil pollution liability. The 1851 Limitation of Liability Act dealt with the general liability of shipowners. The 1972 Federal Water Pollution Control Act Amendments pertained to water pollution in general and included the regulation of oil pollutant discharges. The 1973 Trans-Alaska Pipeline Authorization Act allowed private parties to recover for oil pollution damage. Various other acts since 1973 have dealt with specific aspects of oil pollution control. New broader legislation has been proposed in Congress. Current American law attempts to reconcile the diverse interests in oil pollution liability. Comprehensive legislation is probably the best method to achieve that aim. (Wilson-Florida)

A REVIEW OF NEW COLORADO WATER AND AIR POLLUTION LEGISLATION,
J. Bermingham, and J. Raisch.
The Colorado Lawyer, Vol 2, No 11, p 1-10, September 1973.

Descriptors: *Colorado, *Water quality control, *Sewage disposal, Legislation, Legal aspects, Water law, Pollutants, Water pollution, Environmental control, Sewage, Water quality act.

The 1973 Colorado General Assembly passed a number of environmental bills, some of which have significant and sweeping impact. The Water Quality Act (WQA) was adopted with two goals in mind: (1) to improve existing water pollution legislation; and (2) to comply with the requirements of the 1972 Federal Water Pollution Control Act Amendments. The WQA provides for a Water Quality Control Commission with powers to adopt control regulations and to promulgate water quality standards and waste discharge permit regulations. The administration and enforcement functions have been transferred to the Division of Administration of the Department of Health. House Bill 1553, The Individual Sewage Disposal Systems Act (ISDSA), authorizes the establishment, administration and enforcement of minimum standards, rules and regulations for individual sewage disposal systems. The ISDSA details minimum standards for systems which must be included in all local or state rules and regulations. The General Assembly also introduced amendments to the Colorado Air Pollution Act. Senate Bill 393 dealt with control of pollution from motor vehicles. (Wilson-Florida)

AMERICAN BAR ASSOCIATION RESOLUTION RE NATURAL RESOURCES OF THE SEA ADOPTED BY THE HOUSE OF DELEGATES, AUGUST 6, 1973 AND REPORT OF THE SECTION OF NATURAL RESOURCES LAW RECOMMENDING ADOPTION OF THE RESOLUTION.
American Bar Association, Washington, DC. Natural Resources Section.
Natural Resources Lawyer, Vol 6, No 4, p 589-633, Fall 1973.

Descriptors: *Resource allocation, *International law, *Water resources development, Water law, Resources, Resource development, International waters, International joint commission, Water resources, United Nations.

In response to and in anticipation of United Nations conferences on the law of the sea, the American Bar Association (ABA) passed this resolution, stating its position regarding natural resources of the sea. The resolution addresses: (1) the allocation of seabed resources of the continental margin and those outside the margin; (2) fishing interests; (3) protection of the environment; (4) the need for unimpeded navigation and transportation; (5) assurance of investment integrity; (6) scientific research; and (7) determination of disputes. Accompanying the resolution is a report which traces the history of United Nations actions regarding the law of the sea, particularly the attempts to create an international regime for the exploration and exploitation of seabed resources beyond the limits of national jurisdictions. The major points of the ABA resolution and their historical backgrounds are developed. The most important components of an equitable regime are set forth: The selection of the governing body and the role of the regime. Consideration is given to reasonable and secure investment conditions, to the President's Statement on United States Oceans Policy of May 23, 1970, and to the question of the number of treaties necessary. (Swanson-Florida)

THE ECONOMIC CONSEQUENCES OF ALLOCATING GROUNDWATER TO COMPETING INTEREST IN THE SANTA CRUZ BASIN, PIMA COUNTY, ARIZONA,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
J. C. Wade, and A. H. Griffin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-151483, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona, Project Completion Report, February 26, 1980. 22 p, 1 Fig, 33 Ref, OWRT A-087-ARIZ(3), 14-34-0001-9003.

Descriptors: *Economics, *Aquifer management, *Water rights, *Water user, *Legal aspects, Indian reservations, Water supply, Arizona, Pima County(Ariz), *Tucson Basin, Indian water rights, Papago Tribe.

The groundwater in the Tucson Basin is being drawn faster than it is replenished by nature. The water table is falling, giving rise to several conflicts between water users in the Basin. Several lawsuits are in progress, including an action by the Papago Tribe against some of the major water users in the Basin. Largely because of these difficulties, the State Legislature has established a commission to make proposals for the reform of Arizona's groundwater law. The pattern of water use in the Basin will undoubtedly be changed by the outcome of the present litigation and the coming reform of Arizona's groundwater law. This report gives a short summary of a research project which has studied how water use in the Basin might be affected by changes in the availability of water. The report also gives an account of the effects that these changes in water use could have on the region's economy. The report concludes that the water problems of the Tucson Basin will have little effect on the region at large and that these problems are simply a matter for the Indians and the other water users in the Basin to sort out amongst themselves.

COPPER MINING FROM UNDER LAKE SUPERIOR: THE LEGAL ASPECTS,
F. M. Tuerkheimer.
Natural Resources Lawyer, Vol 7, No 1, p 137-155, Winter 1974.

Descriptors: *Michigan, *Lake Superior, *Mining, Great Lakes, Legislation, Mineral industry, Water pollution, Boundaries, Treaties, Legal aspects, Copper.

Detailed geological studies of the Lake Superior Basin have revealed the high probability of rich copper deposits. Three sets of laws are directly relevant to the exploitation of such copper deposits: (1) international law as reflected in the 1903 Boundary Waters Treaty; (2) United States law as reflected in the 1899 Refuse Act; and (3) state law as reflected in Michigan statutes. Boundary waters,

as defined by the U.S.-Canada treaty, include any body of water through which the international boundary runs. Thus, Lake Superior is subject to Article IV of the treaty which states that boundary waters shall not be polluted. U.S. law is applicable in that Lake Superior is navigable waterbody. The 1899 Refuse Act requires Army Chief of Engineers authorization to build a structure such as a mining platform, in navigable waters. Michigan law makes it unlawful to remove minerals from under the Great Lakes without a lease from the Department of Natural Resources. The long-standing policy of the Department has been to refuse leases for mining operations that involve shafting or rigging. (Wilson-Florida)
W80-03759

THE FEDERAL RESERVED RIGHTS DOCTRINE - FROM 1866 THROUGH EAGLE COUNTY,
Debevoise and Liberman, Washington, DC.
J. C. Muys.
Natural Resources Lawyer, Vol 8, No 2, p 221-235, 1975.

Descriptors: *Federal-state water rights conflict, *Constitutional law, *Federal jurisdiction, Federal government, State governments, Navigable waters, Navigable rivers, Indian reservations, Non-navigable waters, Federal reservations, State jurisdictions.

Regulation of water usage in the western states has been hampered by a continuing competition between the federal and state governments. The federal government claims a power base in the constitutional grants of authority from the Welfare, War and Treaty Powers, and most importantly, from the Commerce and Property Clauses of the federal Constitution. The Supreme Court has held that the Commerce Clause vested control in Congress of all navigable waters, and has enlarged that power over the years to include even control over non-navigable streams which might affect navigable ones. Thus the federal government can prevent application of state laws to 'federal' waters. Further, the navigation servitude allows the federal government to take private property rights without compensation. Under the Property Clause, the argument is that the federal government still owns those lands in the western states which it has not specifically granted to the states, and thus retains the right to regulate water use on those lands. The development of case law on these subjects is traced, including a brief discussion of the Eagle County case, a 1971 decision on federal reserved rights. (Swanson-Florida).

REBORN FEDERALISM IN WESTERN WATER LAW: THE NEW MELONES DAM DECISION,
R. Walston.
Hastings Law Journal, Vol 30, No 6, p 1645-1682, July 1979.

Descriptors: *California, *Federal-state water rights conflicts, *Water allocation(Policy), *Federal reclamation law, Water rights, History, Judicial decisions, Reclamation, California, Legislation, Federal government, Water law.

In many areas of law, the doctrine of federalism has been preempted by the increasing concentration of power at the national level. In water law, however, this trend has been reversed by the United States Supreme Court in California v. United States (the New Melones Dam decision). The original purpose of the 1902 Reclamation Act - in keeping with federalism - was to allow state control of water. This included the doctrine in western states and territories. As federal power expanded in this century, federal power over reclamation grew. The federal government possessed exclusive control of water stored behind federal dams. The New Melones Dam decision has stated that the states have a right to control the water in federal dams to the extent not inconsistent with specific congressional directives. The Court opted for the values of federalism. Uncertainty about the exact relationship of federal and state power can be overcome by giving presumptive correctness to state administrative policies for water allocation. (Wilson-Florida)

BREATHING NEW LIFE INTO SECTION 8 OF THE 1902 RECLAMATION ACT: CALIFORNIA V. UNITED STATES,
T. J. Beaton.
University of Colorado Law Review, Vol 50, No 2, p 207-229, Winter 1979.

Descriptors: *California, *Federal reclamation law, *Water allocation(Policy), *Federal-state water rights conflicts, Judicial decisions, Water rights, Irrigation, Reclamation, Legislation, Water law, Federal government.

One of the more controversial topics in Western water rights has been the relationship between federal and state policies regarding water usage. In California v. United States, the United States Supreme Court found that Section 8 of the 1902 Reclamation Act (Section 8) permitted California to impose conditions on Bureau of Reclamation water appropriation permits, if the conditions were not inconsistent with congressional directives regarding the water project. Section 8 provides that nothing shall be construed to interfere with any state laws relating to water appropriation. Previous decisions construing Section 8 have generally centered on a 'proprietary' theory of state involvement. This theory relegates state power under Section 8 to a minor role of merely defining the property interests involved. California v. United States rejects the proprietary theory and permits states to exercise control over the appropriation and distribution of water impounded by federal reclamation dams where not inconsistent with federal mandates. The issue is primarily one of Congressional intent, and could be easily clarified by Congress. (Wilson-Florida)

STATE CONTROL OVER FEDERAL RECLAMATION PROJECTS,
California State Water Resources Control Board, Sacramento.
W. R. Attwater.
Natural Resources Lawyer, Vol 8, No 2, p 281-295, 1975.

Descriptors: *California, *Federal-state water rights conflicts, *Judicial decisions, *Federal Reclamation Law, Reclamation, Water resources, Water allocation(Policy), State governments, Water law, Federal jurisdiction, State jurisdiction.

California and the United States (U.S.) Bureau of Reclamation have been locked in litigation regarding state authority over reclamation projects. The main issue involved is whether Section 8 of the 1902 Reclamation Act or any other federal law requires the U.S. to comply with state procedures regarding water appropriation when it seeks to acquire previously unappropriated water for project purposes. Although the Bureau's position is that it need not comply with state law regarding water appropriation, in the past, as a matter of comity, it has filed applications and participated in state administrative hearings. California law requires any person who wishes to appropriate water to apply for and receive a permit from the State Water Resources Control Board. Despite the literal language of Section 8 of the Reclamation Act, which preserves state law in reclamation, recent Supreme Court decisions have indicated other provisions of federal law may be overriding. Present reclamation procedures should be modified to meet the needs of both state and federal governments. Some modifications are suggested to the present procedure for authorization and construction of U.S. Bureau of Reclamation projects. (Wilson-Florida)

PIGOVIAN TAXES, POLLUTER SUBSIDIES, REGULATION, AND THE SIZE OF A POLLUTING INDUSTRY,
York Univ., Downsview (Ontario).
P. Burrows.
Canadian Journal of Economics, Vol 12, No 3, p 494-501, August, 1979. 2 Fig, 9 Ref.

Descriptors: *Pollution taxes(Charges), *Regulation, *Optimization, *Economic efficiency, *Size, Taxes, Economics, Curves, Costs, Demand, Industries, Damages, Marginal costs, Equations, Pollution abatement, Industrial wastes, Economic impact, Industrial production.

Pigovian taxes are not generally more efficient for society than other pollution control instruments and may not lead to Pareto-optimal industrial pollution levels. Either of two views may be correct, depending on damage cost curves of individual polluters: (1) Pigovian taxes may induce firms to leave industry when damages they cause do not justify this action. (2) If Pigovian taxes are set equal to marginal damage levels at Pareto-optimal pollution levels, industries will move toward their optimal pollution levels. If a large number of polluters exists in each locality, Pigovian tax leads to Pareto-optimal firm and industry output (pollution) levels; regulation does not reduce industrial pollution towards the Pareto-optimal level; and polluter subsidies perversely moves industrial pollution away from Pareto-optimization even though individual firms respond by cutting their output below Pareto-optimal levels. If small numbers of polluters exist in each locality or individual polluters face upward sloping marginal damage cost curves, Pigovian taxes are socially inefficient and too punitive while regulation/polluter subsidies are not punitive enough to induce Pareto-optimal exit of firms. Therefore, Pigovian taxes should not be used as a general standard of optimality against which to measure polluter subsidies and other polluter control instruments. (Danovich-Wisconsin)

CANADIAN-AMERICAN RELATIONS IN THE ARCTIC: THE EFFECT OF ENVIRONMENTAL INFLUENCES UPON TERRITORIAL CLAIMS,
T. M. Tynan.
The Review of Politics, Vol 41, No 3, p 402-427, July 1979.

Descriptors: *Canada, *Arctic, *United States, *International waters, *Political aspects, North America, International law, Treaties, Commercial fishing, Oil spills, Governments, Navigation, Disasters, Political constraints, Foreign waters, Northwest Passage(Canadian Arctic), Boundaries(Property).

Canadian foreign policy (1880-1970) concerning the Arctic has consistently been based upon a perception of potential threats to Canada's sovereignty and jurisdiction even when such threats never existed. A historical overview is presented to show how these perceptions may have developed. In terms of US-Canadian Arctic interactions, three phases can be discerned: (1) In the first or formative phase, Britain transferred her northern territories in the continent to Canadian control in 1880; from then until about 1940, Canadians were apprehensive that US population in these territories outnumbered those of Canadian citizenship. Canadians in fact only incrementally and tentatively exercized sovereignty rights over foreign economic interests in the territories. (2) The second phase, that of the Second World War and later construction of the Distant Early Warning (DEW) air defense facilities, was one of joint cooperation by the US and Canada; cooperation was partly due to the perception that a foreign threat, if any, came from Europe and Eurasia (Germany, then later, the USSR). (3) The most recent phase began in 1969 with the voyage through the Northwest Passage of the US oil tanker Manhattan. This event galvanized the Canadian government into enacting protective legislation for their Arctic lands, including pollution controls against the possibility of large-scale oil spills. These various historical patterns show Can-

ada's preoccupation with the immediate regional effects of events in the Arctic, regardless of the true thrust of US intentions in these regions. (Harris-Wisconsin)

ENVIRONMENTAL QUALITY AND ECONOMIC DEVELOPMENT,
Mobil Oil Corp., New York.
D. Heath.
Annals of the American Academy of Political and Social Science, Vol 444, p 46-55, July 1979.

Descriptors: *Legislation, *Economics, *Costs, *Environmental control, Environment, Regulation, Benefits, Clean Air Act, Federal Water Pollution Control Act, Legal aspects, Environmental Protection Agency, Return(Monetary), Marginal return, Public health, Economic development, Control, Cost-benefit analysis, Income, Conservation, Governments.

Environmental laws of the United States specifically the Clean Air Act, Water Pollution Control Act, and Resource Conservation and Recovery Act, jeopardize the future well-being of its people. Overcontrol mandated or permitted by these laws is too costly even for an affluent society. Environmental over-control's high cost will cut deeply into family income over the next decade without providing any measurable improvement in health. In 1977, the U.S. spent $40 billion to comply with the three laws. By 1986, the total cost is expected to be $86 billion/yr (1977 dollars), more than double 1977 costs. In 1977, environmental laws cost each American family $600. By 1986 each family will be paying $1,300/yr (1977 dollars) to meet these laws. During 1977, clean-up costs were not critical and large gains were made at relatively low cost; but the law of diminishing returns, where small incremental improvements are very costly, is at work. Governmental overcontrol is evident in five areas: (1) standards based on studies of questionable values, (2) standards based on trivial health effects, (3) excessive safety margins, (4) widening list of pollutants deemed dangerous to health, and (5) arbitrary standards. (Danovich-Wisconsin)

MULTINATIONAL CORPORATIONS, NATION-STATES AND OCEAN RESOURCE MANAGEMENT: THE IMPACT OF THE WORLD'S 200-MILE ECONOMIC ZONE ON MULTINATIONAL AND NATIONAL DEVELOPMENT,
Hawaii Univ., Honolulu. Coll. of Tropical Agriculture.
C. Gopalakrishnan.
American Journal of Economics and Sociology, Vol 38, No 3, p 253-260, July 1979. 2 Tab, 9 Ref. JC-UH Sea Grant 7902.

Descriptors: *Oceans, *Developing countries, *Resources development, *Multinational corporations, *200 Mile exclusive economic zones, Governments, Economics, Law of the sea, Capital, Technology, Resource allocation, Resource management, Coasts, Oil, Legal aspects, Cooperation, Economic impact, Economic development, Exploitation, Natural resources.

Harmonization of the relationship between mulination corporations and nation-States will significantly increase because of a 200-mile exclusive economic shoreline zone in the world oceans. If coastal State's jurisdication extends 200 miles, a fact of international law about to receive juridicial status, a new regime of ocean resource use will emerge. This arrangement will most likely consist of a synergistic partnership of powerful nation-States and powerful multinational corporations, rather than overwhelming dominance and subjugation of one by another. From the perspective of resource use optimization and externalities, less-developed coastal states gain from enlisting the support of multinational corporations. Less developed coastal states lack key factors (capital, technology and managerial skill) necessary to tap oceanic resources. These marine technology factors exist primarily in the private sector. Multinational corporation activity generates new investment and employment opportunities, increases export earnings and improves balance-of-payments for these countries. Multinational corporations also derive numerous benefits, including high marginal capital efficiency and ready access to much-needed resources. What emerges is a unique situation of strong inter-dependence, where one party's strengths are automatically the other's weaknesses and vice-versa. (Danovich-Wisconsin)

LEGAL AND INSTITUTIONAL FACTORS AFFECTING MARICULTURE IN TEXAS,
Mc Glew and Brown, Austin, TX.
P. A. Mc Glew, and D. E. Brown.
Coastal Zone Management Journal, Vol 6, No 1, p 69-88, 1979.

Descriptors: *Texas, *Shellfish farming, *Aquatic animals, Water supply, Federal government, Shrimp, Bays, Dredging and filling, Waste disposal, Legal aspects.

Aquaculture is the technique of farming aquatic animals or plants. Mariculture includes what is popularly known as shrimp farming. Aquaculture and its specialized cousin, mariculture, provide some potential additional food sources and economic revenues. Technological barriers to increased mariculture production are being removed, but many legal and institutional barriers remain. Examples of the current and potential regulation of mariculture in Texas by state and federal authorities are examined. The effect of various state and federal regulations on the development of mariculture is discussed from a legal and institutional viewpoint. The potential for growth of mariculture is considered questionable without regulatory reforms, particularly at the federal level. Examined are the legal constraints in water supply, use of bay bottoms and the water column, dredging and filling operations, limited mariculture operations, waste disposal, taxation and financial aid, pesticides, and state authority over fisheries. The most significant problem facing new entrants into mariculture appears to be the indefiniteness of regulation. Recommendations are given that will remove some of the legal barriers to increased mariculture operations. (Corey-Florida)

WATER RESOURCE POLICIES AND AUTHORITIES: FEDERAL PARTICIPATION IN SHORE, HURRICANE, TIDAL AND LAKE FLOOD PROTECTION (FINAL RULE).
Corps. of Engineers, Washington, DC. Washington District.
Federal Register, Vol 44, No 15 p 4594-4603, January 22, 1979. 1 Tab, 1 App.

Descriptors: *Coastal plains, *Shore protection, *Flood protection, Beaches, Water resources, Cost sharing, Regulation, Federal government, Hazards, Hurricanes.

This regulation provides policies to United States Army Corps of Engineers Offices describing the extent of federal involvement in projects which provide shore, hurricane, tidal and lake flood protection. It is intended to update previous regulations to reflect recent changes in legislation and policy. This regulation makes reference to and provides a synopsis of the program legislation which it affects. The general program policy of the Corps is to undertake projects to prevent erosion and flooding of the coastal areas when those projects best serve the public interest. Special consideration is given to geographic applicability, coastal zone management plans, beach creation, shore categories, public use, and improvements for recreation. The role of the federal government is defined regarding pre-authorization studies, construction maintenance, periodic nourishment and work for other federal agencies. Cost sharing among federal and private concerns and the requirements for local cooperation are set forth. (Corey-Florida)

SALE AND LEASE OF INDIAN WATER RIGHTS,
B. Leaphart.
Public Land and Resources Law Digest, Vol 10, No 2, p 280-290, 1973.

Descriptors: *Indian reservations, *Water allocation(Policy), *Water resource development, Irrigation, Water resources, Federal government, Treaties, Rivers, Water law, Judicial decisions.

The leading case concerning Indian water rights is United States v. Winters, a 1908 Supreme Court decision. In stating that the water of the Milk River-the boundary of an Indian reservation could not be appropriated, the Court stated that the Indians had the entire use of the river's water rights. The 'Winters Doctrine' as developed by subsequent cases, has come to represent three basic propositions: (1) The priority date of a water right is the date the reservation is created, (2) The rights need not be exercised presently; and (3) The quantity of water to be enjoyed is measured by Indian needs, both present and future. In our industrialized nation, the concept of Indian 'need' should not be restricted to traditional agrarian purposes. The water reserved under the Winter's Doctrine should be open to the same development as other resources. As trustee for the Indians, the government should provide for the leasing of reserved waters for use of the Indian reservation. The sale and lease of water rights would enhance the reservation's economy. (Wilson-Florida)

OWNER ELIGIBILITY RESTRICTIONS - ACREAGE AND RESIDENCY,
Water and Power Resources Service, Sacramento, CA. Mid-Pacific Region.
C. R. Renda.
Natural Resources Lawyer, Vol 8, No 2, p 265-280, 1975.

Descriptors: *Federal Reclamation Law, *Water distribution(Applied), *California, Reclamation, Legislation, Federal jurisdiction, Water law, Water allocation(Policy), Legal aspects, Federal project policy, Administrative agencies.

Acreage and residency problems under reclamation law are not new. They have existed since the original 1902 Reclamation Act (Act). Current problems involving federal reclamation projects typically concern the development of private lands and the application of owner eligibility restrictions. Section 5 of the Act imposes a 160 acre limit for water rights from federal projects. These are referred to as 'non-excess lands'. However, the Bureau of Reclamation (Bureau) has permitted owners of larger tracts to make application for water covering all their lands subject to the condition that these 'excess lands' be subsequently transferred to an eligible person. Enforcement of these contractual promises is extremely difficult. Problems arise in regard to transfers to joint tenants, trusts, partnerships, corporations, and other legal arrangements. The Act also requires the participating landowner to be a bona fide resident or occupant of that land. The Bureau has not enforced this requirement since the 1926 Omnibus Adjustment Act. A United States District Court held in 1972 that the restriction is required by the Act, as a continuing restriction upon the right to receive project water. As of this article, that decision was on appeal. (Wilson-Florida).

SPATIAL ASPECTS OF THE PRESSURE FOR SHORELINE DEVELOPMENT: THE EXAMPLE OF PUGET SOUND,
Ottawa Univ. (Ontario). Dept. of Geography and Regional Planning.
P. Harrison.
Coastal Zone Management Journal, Vol 2, No 2, p 125-148, 1975.

Descriptors: *Washington, *Spatial distribution, *Water management(Applied), Coasts, Management, Legislation, Urbanization, Developed waters, Water law, Water resources development, Shores.

When environmental legislation is enacted, the nature and spatial structure of the resulting management area are rarely considered in any detail. Several specific variables create different spatial pressures on the use of salt water shorelines. Population growth, urbanization, employment structure, and personal income in the Puget Sound region of Washington are analyzed. The bulk of population, wealth, and economic activity in Washington state is in the Puget Sound area. The Seattle-Tacoma metropolitan area is the source of much pressure for further shoreline development. The spatial expression of this development is analyzed in two contexts: (1) 'Spread' development or low density use spread in a line along the shoreline; and (2) 'Nucleated' development involves the use of less shoreline, but with higher density of use. Through 'spatial dominance' the more affluent areas affect and control economic development. Recent shoreline management legislation completely ignores those spatial phenomena. The burden of shorelines management is placed upon local authorities. Ironically, poorer rural counties then must provide for the spillover and domination effect of the more affluent municipality areas. Giving counties the initiative in shoreline management is no guarantee that differential spacial structure will be taken into account. (Wilson-Florida).

WILL JUDICIAL ERROR ALLOW INDUSTRIAL POINT SOURCES TO AVOID BPT AND PERHAPS BAT LATER. A STORY OF GOOD INTENTIONS, BAD DICTUM, AND UGLY CONSEQUENCES,
Weston, Hurd, Fallon, Paisley, and Howley, Cleveland, OH.
J. S. Kalur.
Ecology Law Quarterly, Vol 7, No 4, p 955-988, 1979.

Descriptors: *Federal Water Pollution Control Act, *Water quality standards, *Water pollution control, Regulation, Legislation, Effluents, Industrial wastes, Judicial decisions, Water pollution sources, Water law, Administrative agencies.

Section 301 (6) of the Federal Water Pollution Control Act Amendment (FWPCA) is the heart of a plan to reduce or eliminate water pollution discharges from point sources. By July 1, 1977, all dischargers were to have achieved compliance with designated effluent limitations via installation of the 'best practicable technology' (BPT) at all point sources. To fill the expected period between passage of the FWCPA and establishment of limitations, an interim permit program was created by section 402 (a) (1) which allowed lawful discharge prior to the adoption of BPT. The Federal Environmental Protection Agency has generally failed to include provisions to assume BPT compliance in the interim permits. Since most permits were issued for five years, a postponement of compliance was approved by the Supreme Court in du Pont v. Train. The intent of Congress was to require uniformity in water pollution control. The failure of industrial point sources to meet BPT limitations by the deadline has thwarted this plan. (Wilson-Florida)

'ONE PERSON, ONE VOTE' AND CALIFORNIA'S WATER DISTRICTS,
Auburn Univ., AL.
D. L. Martin.
Natural Resources Lawyer, Vol 8, No 1, p 9-28, 1975.

Descriptors: *California, *Water districts, *Constitutional law, Judicial decisions, State government, Water law, Legal aspects, Public utilities, Irrigation, Districts, Decision making water policy.

Special districts performing water utility operations in California have a variety of enabling acts to which reapportionment challenges have been raised in the courts. Some elect their directors on a resident voting basis. Others restrict the franchise to landowners, with votes proportioned to the number of acres held or according to assessed valuation. The legal challenges over existing voting arrangements are fundamentally a struggle for control over vast economic resources. The issue has been whether the 'one person, one vote' finding of the reapportionment revolution of the 1960's should be extended to water districts. The judicial analysis has traditionally been in terms of whether the principal purpose of the special water district was to provide services without exercising the general powers of government. In 1973, the United States Supreme Court declined to intervene in the voting arrangements of a water storage district. The majority held that the district provided none of the general public services attributed to a governing body. The courts face future challenges in defining the applicability of the Equal Protection Clause to quasi-public utility districts. (Wilson-Florida)

THE CONVENTION FOR THE PREVENTION OF MARINE POLLUTION FROM LAND-BASED SOURCES: AN EFFECTIVE METHOD FOR ARBITRATING INTERNATIONAL EFFLUENT POLLUTION DISPUTES,
R. H. Busby.
California Western International Law Journal, Vol 5, No 2, p 350-375, Spring 1975.

Descriptors: *Water pollution control, *International commissions, *International law, Effluents, Coasts, Pollutants, Water law, Water pollution, Oceans, Legal aspects.

Effluent pollution, broadly defined as the flow of waste materials into rivers and coastal seas, has reached alarming proportions. This pollution is produced primarily by man's land-based industrial activities. Effluent pollution occurs mainly in the coastal waters. Arbitration, diplomacy, and litigation are among the methods available to the international community to control and combat this form of marine pollution. Diplomatic channels have drawbacks which prohibit their effective use against pollution: (1) lack of speed and directness; (2) national interests; and (3) suspicion by lesser developed nations of economic coercion. Litigation is hindered in its effectiveness by problems with jurisdiction, determining the proper party to bring the action, and appropriate theories of liability. International arbitration has been effectively employed as a means to settle disputes. Submission of a conflict to arbitration minimizes political maneuvering and permits concentration on the merits of the controversy. The Convention for the Prevention of Marine Pollution from Land-Based Sources, utilizing arbitration, presents guidelines for a comprehensive, regionally organized effort at pollution control. The waters in which its provisions apply are multi-national. Its flexibility and potential speed of action make it an important tool against pollution. (Wilson-Florida)

MARINE RESOURCES COMMITTEE-ANNUAL REVIEW OF SIGNIFICANT LEGISLATIVE, JUDICIAL AND ADMINISTRATIVE ACTIVITIES DURING 1977.
American Bar Association, Washington, DC. Natural Resources Law Section.
Natural Resources Lawyer, Vol 11, No 1, p 76-97, 1978.

Descriptors: *Marine fisheries, *Shore protection, *Water pollution control, Legislation, Judicial decisions, Administrative decisions, International commissions, Fisheries, Mining, Federal government, Oceans.

A review of legal activity related to United States offshore seabed resources, reveals: (1) Two bills were introduced in Congress to amend the Outer Continental Shelf Lands Act, but were not enacted; (2) the Secretary of the Interior established a new policy for lease sales. Concerning deepwater ports, the Secretary of Transportation issued several licenses with some new modifications of the conditions contained in the forms of license. Regarding coastal zone management, regulations written by the Office of Coastal Zone Management to implement the Coastal Energy Impact Program come under frequent attack in Congress. Coastal zone management plans in Oregon and California were approved. The most significant activity in the fisheries area was the implementation of the Fishing and Conservation Act. As to deep seabed hard minerals, the United Nations Conference on the Law of the Sea issued an 'Informal Composite Negotiating Text'. Congress considered legislation to regulate high seas mining by American ships. Regarding the preservation of the marine environment, several states passed comprehensive oil spill liability laws. The federal courts upheld several pollution statutes. Voluntary pollution liability agreements are discussed. President Carter submitted proposed new rules, regarding the transportation of marine resources, under the authority of the 1972 Ports and Waterways Safety Act. These are applicable to all ships trading to United States ports. (Wilson-Florida)

EMPLOYMENT IN THE FISHING INDUSTRY: SOME PRELIMINARY FINDINGS ON FISHERMEN'S MOBILITY,
C. L. Yap.
The Developing Economies, Vol 16, No 3, p 283-297, September, 1978. 13 Tab, 12 Ref.

Descriptors: *Commercial fishing, *Social mobility, *Malaysia, *Labor supply, Fisheries, Employment, Employment opportunities, *Social aspects, Social needs, Trawling, Income, Labor, Labor mobility, Size, Education.

large numbers of children per family, their low education and training level, and their occupational immobility are the main reasons for a cycle of overmanned fishing boats and individual underemployment in Malaysia. Money, used to subsidize fishery expansion in waters already overfished, is better utilized by training and equipping young people less entrenched in the traditional social setup to take on other occupations. Alternatively, incentives may be provided to the private sector to locate their manufacturing plants and business enterprises near fishing communities. Social dislocation may be less than that experienced by an individual exercising his own initiative. Malay peasant fishermen have an extended family system in which it is socially unacceptable to exclude a relative or friend who is unemployed from sharing in a catch. Fisherman remuneration is by profit sharing. When the trawl net was adopted in 1965, many people took up fishing, leading to overfishing and extreme employment fluctuations. A study in findings, one of the most important fishing districts in Peninsular Malaysia, show that 78% of the fishermen are intra-district movers and only 22% are inter-district/state movers. The ratio of child movers to parents varies 0.4-0.7:1, indicating low mobility. Mean average number in a family is 6-7. Only 82.4% of fishermen have attended primary schools and 0% have received secondary schooling. (Danovich-Wisconsin)

INSTRUMENTATION OF URBAN HYDROLOGY MONITORING SITES IN SOUTHEAST FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
J. Hardee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-123417, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-37, July 1979. 38 p, 23 Fig, 9 Ref.

Descriptors: *Instrumentation, *Urban hydrology, *Florida, *Data collections, *Monitoring, Sites, Sampling, Rainfall, Urban runoff, Storm runoff, Storm drains, Water quality, Measurement, Logging(Recording), Analog models, Venturi flumes, *U-shaped constriction, *Stilling well, *Electromagnetic velocity meter, Southeast Florida.

An instrumentation system developed and built in laboratories of the U.S. Geological Survey, Reston, Va., has been used since 1974 to collect synchronized rainfall, runoff, and water-quality data from urban basins. A number of field modifications were made to adapt the system to local hydrologic conditions and for collection of data on about 350 rainstorms at four sites in south Florida. The instrumentation system measures rainfall at three sites, records two pressure or water-level readings for flow computations, and collects and refrigerates up to 24 water samples and rainfall-quality samples. Rainfall and runoff data are recorded every 36 seconds on a six-channel analog recorder so that all variables are time-synchronous. Flow in the storm sewer is computed from pressure measurements in a U-shaped venturi-type constriction or, when the constriction is not used, from water levels. (Kosco-USGS)

EROSION POTENTIAL ASSESSMENT FOR THE WILLAMETTE RIVER BASIN, OREGON,
California Inst. of Tech., Pasadena. Environmental Quality Lab.
W. M. Brown, III.
In: River-Quality Assessments; Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. p 84-100, 1978. 2 Fig, 4 Tab, 18 Ref.

Descriptors: *Water quality, *Erosion, *River basins, *Oregon, Watersheds(Basins), Synoptic analysis, Planning, Sedimentation, Mapping, Environment, Analytical techniques, Soil erosion, Land use, Precipitation(Atmospheric), Runoff, Vegetation, Soils, Deposition(Sediments), Aerial photography, Methodology, Topography, *Willamette River Basin(OR), Matrix methods.

A synoptic approach was devised to delineate the relationships that exist between physiographic factors, land-use activities, and resultant erosional problems. The approach involves the development of an erosional-depositional province map and a numerical impact matrix for rating the potential for erosional problems. The province map is prepared by collating data on the natural terrain factors that exert the dominant controls on erosion and deposition in each basin. In addition, existing erosional and depositional features are identified and mapped from color-infrared, high-altitude aerial imagery. The axes of the impact matrix are composed of weighting values for the terrain factors used in developing the map and by a second set of values for the prevalent land-use activities. The body of the matrix is composed of composite erosional impact ratings resulting from the product of the factor sets. Together the province map and problem matrix serve as practical tools for estimating the erosional impact of human activities on different types of terrain. The approach has been applied to the Willamette River basin, Oregon, and has proven useful for the recognition of problem areas. The erosional potential map and matrix are useful tools for (1) immediate land-use planning, (2) the selection and monitoring of best management practices, and (3) the design of data collection programs to assess land and river quality. For all three purposes, the tools are flexible, because through interpretation of aerial photography, they can be regularly updated to provide information under rapidly changing conditions. INDEX TO SOURCES OF HYDROLOGIC DATA,
California State Dept. of Water Resources, Sacramento.
Bulletin 230-78, July 1978. 321 p, 5 Tab.

Descriptors: *Hydrologic data, *Data collections, *California, *Stations, Information retrieval, Surface waters, Water quality, Groundwater, Groundwater resources, Gaging stations, Drainage area, Water levels, Wells, Well data.

This first edition of 'Index to Sources of Hydrologic Data' comprises four independent sections: an index to surface water measurement stations, an index to surface water quality stations, an inventory of groundwater wells and data, and a list of current publications on climatological data. Initiation of this new periodic series as a reference publication replaces the Department's series of data publications, 'Hydrologic Data'. Bulletin 230 represents a fundamental change: rather than reporting the data, it provides both a summary of sources from which the data may be obtained and the Water Data Information System (WDIS). WDIS is a computer-based system that presently manages surface water quality data, groundwater level measurements, and groundwater quality data. This means that data of these disciplines can be retrieved or evaluated by using a common group of record identification fields. Among these are Hydrographic Areal Designation, Station Number, Date and Time (of observation), and County. Other fields--or addresses--not yet common to all the disciplines are Latitude and Longitude and the U.S. Public Land Survey (Township, Range, and Section). Data are presently entered, stored, and retrieved at the Department's computer center in Sacramento. Data in the water quality disciplines are summarized under six parameter groups: minerals, nutrients, minor elements, supplemental minor elements, miscellaneous, and pesticides. WDIS has about 120 electronic data processing programs written to store, retrieve, evaluate, and print out data for water quality and groundwater level measurements. (Humphreys-ISWS)

WATER RESOURCES DATA FOR INDIANA, WATER YEAR 1978.
Geological Survey, Indianapolis, IN. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-144355, Price codes: A17 in paper copy, A01 in microfiche. Geological Survey Water-Data Report IN-78-1, September 1979. 383 p, 4 Fig, 3 Tab.

Descriptors: *Indiana, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1978 water year for Indiana consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels in wells. This report contains discharge records for 194 gaging stations, stage and contents for 13 lakes and reservoirs, water quality for 49 gaging stations, and water levels for 59 observation wells. Also included are 124 crest-stage partial-record stations and 49 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal Agencies in Indiana. (Kosco-USGS)
W80-03752

WATER RESOURCES DATA FOR ALASKA, WATER YEAR 1978.
Geological Survey, Anchorage, AL. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-143910, Price codes: A19 in paper copy, A01 in microfiche. Geological Survey Water-Data Report AK-78-1, November 1979. 425 p, 4 Fig.

Descriptors: *Alaska, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1978 water year for Alaska consist of records of stage, discharge, and water quality of streams; stage and water quality of lakes; and water levels and water quality in wells and springs. This report contains discharge records for 117 gaging stations, stage only records for 2 gaging stations, water quality for 64 stations, and water levels for 28 observation wells. Also included are 79 low-flow, 87 crest-stage, and 24 water-quality partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements of discharge, lake stage, or water quality. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Alaska. (Kosco-USGS)
W80-03753

WATER RESOURCES DATA FOR FLORIDA, WATER YEAR 1978--VOLUME 3A-1. SOUTHWEST FLORIDA SURFACE WATER.
Geological Survey, Tallahassee, FL. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-124662, Price codes: A13 in paper copy, A01 in microfiche. Geological Survey Water-Data Report FL-78-3A-1, September 1979. 272 p, 10 Fig, 1 Tab.

Descriptors: *Florida, *Hydrologic data, *Surface waters, Gaging stations, Streamflow, Flow rates, Lakes, Reservoirs, Water levels, Data collections, Sites, Southwest Florida, *Lake elevations.

Water resources data for the 1978 water year in Florida consist of discharge records for 295 streams, stage-only records for 206 streams, elevations for 216 lakes, water level measurements for 1134 wells and crest-stage partial-records for 54 streams. Water quality data for approximately 550 streams or lakes and 1050 wells are included. The data in this volume for Southwest Florida includes discharge records for 70 streams, stage-only records for 24 streams, elevations for 110 lakes, miscellaneous measurements, and crest-stage partial records for 12 streams. These data represent the

National Water Data System records collected by the U.S. Geological Survey and cooperating local, State and Federal agencies in Florida. (Kosco-USGS)
W80-03754

WATER RESOURCES DATA FOR FLORIDA, WATER YEAR 1978--VOLUME 3A-2. SOUTHWEST FLORIDA SURFACE WATER QUALITY.
Geological Survey, Tallahassee, FL. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-126386, Price codes: A99 in paper copy, A01 in microfiche. Geological Survey Water-Data Report FL-78-3A-2, September 1979. 614 p, 3 Fig, 1 Tab, 9 Ref.

Descriptors: *Florida, *Hydrologic data, *Surface waters, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Data collections, Sites, Southwest Florida.

Water resources data for the 1978 water year in Florida consist of discharge records for 295 streams, stage-only records for 206 streams, elevations for 216 lakes, water level measurements for 1134 wells and crest-stage partial-records for 54 streams. Water quality data for approximately 550 streams or lakes and 1050 wells are included. The data in this volume for Southwest Florida includes water quality data for approximately 245 surface water sites. These data represent the National Water Data System records collected by the U.S. Geological Survey and cooperating local, State and Federal agencies in Florida. (Kosco-USGS)
W80-03755

WATER RESOURCES DATA FOR FLORIDA, WATER YEAR 1978--VOLUME 3B. SOUTHWEST FLORIDA GROUND WATER.
Geological Survey, Tallahassee, FL. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-126394, Price codes: A99 in paper copy, A01 in microfiche. Geological Survey Water-Data Report FL-78-3B, September 1979. 616 p, 19 Fig, 1 Tab, 9 Ref.

Descriptors: *Florida, *Hydrologic data, *Groundwater, *Water quality, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, Southwest Florida.

Water resources data for the 1978 water year in Florida consist of discharge records for 295 streams, stage-only records for 206 streams, elevations for 216 lakes, water level measurements for 1134 wells and crest-stage partial-records for 54 streams. Water quality data for approximately 550 streams or lakes and 1050 wells are included. The data in this volume for Southwest Florida includes periodic water level measurements for 450 wells and water quality data for approximately 300 wells. These data represent the National Water Data System records collected by the U.S. Geological Survey and cooperating local, State and Federal agencies in Florida. (Kosco-USGS)
W80-03756

SURFACE-WATER FEATURES IN OSCEOLA COUNTY AND ADJACENT AREAS, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
G. H. Hughes, and J. M. Frazee, Jr.
Geological Survey open-file report 79-1289 (WRI), 1979. 1 Sheet, 11 Fig, 3 Tab, 4 Ref.

Descriptors: *Surface waters, *Hydrologic properties, *Florida, *Water quality, *Lakes, Basins, Streams, Streamflow, Drainage, Rainfall, Evapotranspiration, Evaporation, Gaging stations, Sampling, Sites, Hydrologic data, Chemical analysis, Maps, *Osceola County(Fla).

The western two-thirds of Osceola County, Fla., drains southward by way of the Kissimmee River and its tributaries; the eastern one-third drains eastward to the St. Johns River or to marshy areas that make up part of the headwaters of the St. Johns River. About 15 percent of the county is covered by several hundred lakes whose surface areas range in size from a few to several thousand acres. Much of the natural drainage has been altered by canalization or regulated by control structures. Under natural conditions streamflow is seasonal, usually high in September or October and low in May or June, in phase with the rainy season. Control structures are used to maintain lake levels within a relatively small range in stage, producing greater seasonal variations in river flow than before regulation. Dissolved-solids concentration of much of the surface water is less than 240 mg/l, in some, much less. The water typically is of calcium bicarbonate type. Color is fairly high, in water draining from swamps, where the pickup of humic acids is significant. (Kosco-USGS)

SELECTED WATER RESOURCES DATA, CLARION RIVER AND RED-BANK CREEK BASINS, NORTHWESTERN PENNSYLVANIA--PART 2,
Geological Survey, Pittsburgh, PA. Water Resources Div.
T. F. Buckwalter, C. H. Dodge, and G. R. Schiner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-104915, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-19, July 1979. 135 p, 51 Fig, 8 Tab, 8 Ref.

Descriptors: *Hydrologic data, *Groundwater resources, *River basins, *Pennsylvania, *Basic data collections, *Water quality, Surface waters, Aquifers, Water levels, Water yields, Water wells, Springs, Chemical analysis, Sampling, Sites, Water analysis, Trace elements, Aquatic insects, *Northwestern Pennsylvania, Clarion River Basin(Pa), Redbank Creek Basin(Pa).

This report presents selected basic data collected during a study of the water resources of the Clarion River and Redbank Creek basins in northwestern Pennsylvania. Hydrologic information including data on aquifers, water levels, and yields is presented for 1,304 wells. Records for 51 springs are also given. The report contains 83 chemical analyses of water samples collected from 30 stream sites and 300 analyses of water from 196 wells and 43 springs. Also included are 103 trace-element analyses. Monthly and annual means of groundwater levels for six observation wells are tabulated. Benthic invertebrate data from 136 stream sites are listed. Locations of data-collection sites are shown on 50 page-size reductions of 7.5-minute topographic quadrangle maps. (Kosco-USGS)

SUMMARY OF U.S. GEOLOGICAL SURVEY INVESTIGATIONS AND HYDROLOGIC CONDITIONS IN THE SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT FOR 1978,
Geological Survey, Tallahassee, FL. Water Resources Div.
R. L. Knutilla, and H. C. Rollins.
Available from: OFSS Bx 25425 Fed. Ctr. Denver, CO paper copy 16. microfiche $3.50. Geological Survey open-file report 79-1257, 1979. 118 p, 35 Fig, 3 Tab, 6 Ref.

Descriptors: *Water resources, *Projects, *Publications, *Abstracts, *Bibliographies, Groundwater, Surface waters, Water quality, Streamflow, Water supply, Water utilization, Water resources development, Reviews, Florida, *Southwest Florida.

This report summarizes water-resources investigations in the Southwest Florida Water Management District performed by the U.S. Geological Survey, Water Resources Division, for fiscal year 1978. The investigations are part of the Federal program of appraising the nation's water resources. The cooperative program for fiscal year 1978 included 37 interpretive investigations. Abstracts of 30 reports released during 1978 and a bibliography of reports released since 1933 are included. The hydrologic setting of southwest Florida and discussions of surface-water, ground-water, and quality-of-water conditions are given. Hydrologic conditions in southwest Florida are described and illustrated by hydrographs of selected surface-water, ground-water and lake-stage data collection sites. In addition, summaries of water-use data and data on the regional observation monitor-well program are provided. (Kosco-USGS)

INTERPRETATION OF UNENHANCED LANDSAT IMAGERY FOR WETLAND AND LAND USE DELINEATION IN THE TEXAS COASTAL ZONE,
Texas Univ. at Austin. Bureau of Economic Geology.
R. J. Finley.
Transactions--Gulf Coast Association of Geological Societies, Vol 26, p 279-297, 1976. 14 Fig, 4 Tab, 16 Ref.

Descriptors: *Wetlands, *Texas, *Remote sensing, *Terrain analysis, Coastal marshes, Mapping, Land use, Satellites(Artificial), Distribution patterns, Maps.

LANDSAT imagery was used in a procedure dependent on optical enlargement of part of a band 7 1:1,000,000 image to fit an existing 1:250,000 map base. Land-water and other boundaries were placed on an overlay on which unit boundary data was interpreted from both other bands and the false-color composite of bands 4, 5, and 7. Each resulting map unit was then classified according to a bi-level classification scheme. Level I classes include urban areas, agricultural land, grassland, woodland, water, wetlands, and barren lands. Twenty-three Level II categories included five wetland classes: topographically low marshes, topographically high marshes, tidal flat, grass and algal flats, and vegetated spoil. Water was separated into four Level II classes on the basis of turbidity. Comparison of the LANDSAT maps with aerial photography, published maps, and field data has shown that the Level II category delineation limits are primarily dependent on size of the map unit relative to LANDSAT's resolution limits and on reflectivity contrast with surrounding units. Other factors influencing accuracy include homogeneity of the map unit, spatial position with respect to surrounding units, season of the year in which imagery was taken, and image quality. MEASUREMENTS OF COMBINED OSCILLATORY AND STEADY FLOW OVER A ROUGH BED,
MacDonald (Sir M.) and Partners, Cambridge (England).
C. B. George, and J. F. A. Sleath.
Journal of Hydraulic Research, Vol 17, No 4, p 304-313, 1979. 10 Fig, 8 Ref.

Descriptors: *Steady flow, *Velocity, *Flow, Roughness(Hydraulic), Roughness coefficient, Hydraulics, Anemometers, Currents(Water), Waves(Water), Sediment transport, Equations, Open channel flow, Laboratory tests, Analytical techniques, Analysis, Model studies, *Oscillatory flow, Rough bed.

Measurements are described of the fluid velocities close to a rough bed oscillating in its own plane in a chamber with superimposed mean drift. The measurements were made in air with a hot-wire anemometer. It was found that over a wide range of conditions the common assumption that the combined flow may be treated as the vector sum of the steady and oscillatory flows separately is incorrect. In all cases investigated, the drift near the bed was less than that which would have been expected in the absence of non-linear interaction between the oscillatory and steady flows. For certain conditions the drift near the bed was actually in the opposite direction to that of the superimposed flow. (Lee-ISWS)

OBSERVATIONS OF STRATIFIED FLOW PAST THREE-DIMENSIONAL BARRIERS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Earth and Planetary Sciences.
P. G. Baines.
Journal of Geophysical Research, Vol 84, No C12, p 7834-7838, December 20, 1979. 7 Fig, 7 Ref. NSF OCE78-19833.

Descriptors: *Flow, *Flow around objects, *Laboratory tests, Flumes, Hydraulic models, Model studies, Fluid mechanics, Barriers, Stratified flow, Hydraulics, Hydrology.

Experiments on stratified flow at large Reynolds numbers over barriers with gaps, towed along the bottom of a long tank, were described. The primary purpose of the observations was to determine the circumstances under which fluid flows over the barrier or is deflected horizontally around the barrier through the gap. A range of gap widths (including zero) was used, and the barrier had 'Witch of Agnesi' profile with height about half width. For the two-dimensional barrier (i.e., zero gap), blocked fluid was observed upstream if F = U/Nh was less than 0.5. For the same barrier with a gap, if F was less than 0.5, all the fluid incident below a certain height z sub s(less than h) flowed around the barrier through the gap; above this height the fluid flowed over the barrier in nearly two-dimensional fashion. The parameter z sub s was a function of both F and gap width. For F greater than 0.5 all (or almost all) of the fluid incident on the barrier flowed over it, and the motion was predominantly two dimensional in the vertical plane. (Sims-ISWS)

FLOW VISUALIZATION IN COMPLEX TURBULENT FLOWS,
Chiap Hua Comalco Ltd., Kowloon (Hong Kong).
L. H. Y. Lee, and J. A. Clark.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY2, Proceedings Paper 15209, p 247-268, February 1980. 14 Fig, 2 Tab, 37 Ref, 1 Append.

Descriptors: *Turbulence, *Boundary layers, *Flow separation, *Shear, Model studies, Hydraulic models, Flumes, Jets, Injection, Flow, Turbulent flow, Flow friction, Transition flow, Viscosity, Bubbles, Entrainment, Hydrodynamics, Hydraulics, *Flow visualization, Vortices.

Angled injection of submerged laminar plane jets into a turbulent boundary layer developed along a vertical wall of a large recirculating water channel was visualized. The mixing layers associated with the jet and their interaction with the boundary layer and resulting transition mechanisms in the generation of turbulence were described. A recirculation bubble region related to separation was revealed, and primary systematic transverse vortex structures formed in the outer mixing layer of the jet were characterized. A physical model was proposed which describes the initiation, the formation, and the coalescence of vortices as part of a transition process in the development of turbulence. (Sims-ISWS)

DAMPING OF GRAVITY WAVES OVER POROUS BED,
Maine Univ. at Orono. Dept. of Mathematics.
K. K. Puri.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY2, Proceedings Paper 15214, p 303-312, February 1980. 2 Fig, 10 Ref, 3 Append.

Descriptors: *Gravity waves, *Viscous flow, *Beds, *Model studies, Mathematical models, Porous media, Porosity, Permeability, Channels, Flow, Hydrodynamics, Hydraulics, *Wave damping.

The damping of gravity waves over the contaminated free surface of a viscous layer of fluid that is bounded below by a porous bed was investigated. It was assumed that the bed is saturated with the same fluid. The coupled system of linearized equations appropriate to the fluid layer and the porous bed was solved to study the damping of a progressive wave on the surface of the fluid. The dispersion relation yielding the dependence of the frequency on the viscosity on the parameters related to the porous bed, and on the free surface film, was derived. The effect of the latter on the damping of the waves was found to be very significant. The results obtained subsumed the hitherto known results of other authors. (Sims-ISWS)

AIR BUBBLES IN A CONVECTIVELY ACCELERATED WATER FLOW,
Khartoum Univ. (Sudan). Dept. of Civil Engineering.
A. M. A. Salih.
Journal of Hydraulic Research, Vol 17, No 4, p 315-327, 1979. 6 Fig, 1 Tab, 21 Ref.

Descriptors: *Bubbles, *Flow, *Laboratory tests, *Mathematical models, Model studies, Velocity, Movement, Settling velocity, Instrumentation, Photography, Hydraulics, Civil engineering.

The motion of injected air bubbles of equivalent diameters between 0.98 mm to 6.25 mm was experimentally studied using photographic recordings. The theoretical analysis formulated for this study showed that the relative velocity of the air bubbles approached a state similar to the terminal velocity in still water shortly after being subjected to acceleration. Experimental results conclusively proved that the theoretical approach and formulae were developed to express these experimental findings in accordance with the theoretical and statistical approaches. PREPARATION OF FRIABLE AQUIFEROUS SPECIMENS,
Humphreys (Howard) and Partners, Reading (England).
P. F. Worthington.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY2, Technical Note, p 333-337, February 1980. 2 Fig, 7 Ref, 1 Append.

Descriptors: *Aquifers, *Sampling, *Porous media, *Methodology, Castings, Aquifer characteristics, Testing procedures, Permeameters, Limestones, Groundwater, Sandstones, Protection, Friable specimens.

This note described the procedure adopted for the preparation of friable limestone and sandstone specimens of markedly variable lithology taken from the post-Cretaceous succession of the Kalahari Basin. Preliminary trials with sample fragments demonstrated that their indiscriminate saturation under a vacuum resulted in disintegration. Thus, it was essential that the cubic specimens be cast in a retaining medium before any attempt at saturation. All casting was carried out at room temperature using a commercial liquid, solvent-free epoxy resin (specific gravity 1.15) together with a liquid hardener (specific gravity 1.0) mixed in the ratio 10:1 by weight, and possessing the properties of negligible cure shrinkage, high heat resistance, very low water absorption, and high electrical resistivity. The measurement of intergranular permeability required that each mounted specimen be fixed into a cell. This proposed method for the preparation of friable specimens for petrophysical measurement has several distinct advantages. With the exception of the invaded zones, the specimen is preserved in the same state as in the original core sample. No loss of specimens has been suffered either by disintegration during saturation, flushing and drying, or through uncontrolled contamination by the casting mixture. The specimen is fully protected against accidental damage by the mounting fixture which has proved to be extremely durable. Futhermore, the proposed procedure for the preparation of specimens does not physically impede the subsequent petrophysical investigations. (Humphreys-ISWS)

8I. Fisheries Engineering

A BIOECONOMIC MODEL OF THE GULF OF MEXICO SHRIMP FISHERY,
Texas A and M Univ., College Station. Dept. of Wildlife and Fisheries Sciences.
W. E. Grant, and W. L. Griffin.
Transactions of the American Fisheries Society, Vol 108, No 1, p 1-13, January, 1979. 6 Fig, 5 Tab, 22 Ref. 04-6-158-44108.

Descriptors: *Model studies, *Galveston Bay, Texas, *Commercial fishing, *Shrimp, *Economics, Simulation analysis, Coasts, Bays, Fisheries, Shellfish, Gulf of Mexico, Commercial shellfish, Harvesting, Seasonal, Management, Depth, Rent, Size, Distribution, Income.

A bioeconomic simulation model of the Gulf of Mexico shrimp industry is capable of assessing impacts of alternative management strategies on shrimp harvests. The model accurately predicts general trends in shrimp harvest seasonality and

distribution in relation to shrimp size and water depth. Simulations were confined to the brown shrimp (Penaeus aztecus) fishery in Galveston Bay, Texas and adjacent offshore waters. The model predicts 2.31 million kg (heads-off weight) annual harvest, 1963-1971, while actual data indicate a 2.22 million kg annual harvest during this period. Almost 80% of the harvest is composed of shrimp in 44-66 and 67-110 tails/kg size classes. Total weight of each size class landed generally increases from the bay to successively deeper offshore areas. The harvest is highly seasonal; 94% of landings occurs May-October. Gross fishery revenue is $41 million and annual rent is $4.2 million. Model results imply that some management alternatives such as doubling nominal days fished may increase total harvest; however, marginal fishing costs increase at a relatively higher rate, reducing rent to the fishery. Sensitivity analysis emphasizes the need for better information on shrimp growth and natural mortality and on the proportion of the population which is actually subjected to fishing pressure. Two Electivity Indices for Feeding with Special Reference to Zooplankton Grazing,
W80-03810 5C

Assessment of Aquatic Weed Problems,
W80-03826 4A

Formulating Aquatic Weed Management Programs,
W80-03841 4A

Hedonic Prices, Property Values and Measuring Environmental Benefits: A Survey of the Issues,
W80-03847 6B

ANIMAL BEHAVIOR

Carnivorous Feeding Behavior of the Adult Calanoid Copepod Acartia Tonsa Dana,
W80-03783 5C

ANTHROPOLOGY

Systems Ecology, People Ecology, and the Anthropology of Fishing Communities,
W80-03860 6B

APPLICATION EQUIPMENT

Flow Control Devices Particularly Useful for Drip Irrigation,
W80-03604 3F

AQUA-KLEEN (TRADE NAME)

Dynamics and Behavioral Toxicology of Aqua-Kleen (Trade Name) (2,4-D Butoxyethanol

Ester) as Revealed by the Modification of Rheotropism in Rainbow Trout,
W80-03703 5A

AQUATIC ALGAE
Extraction and Accumulation of 210Pb by Aquatic Organisms in Lakes,
W80-03677 5B

Algae Grown on Wastewater as a Source of Protein for Young Chickens and Rats,
W80-03817 3C

Secondary Toxicology and Contaminants of Algae Grown on Wastewater,
W80-03818 3C

AQUATIC ANIMALS
Distribution of Macrofauna on a Malayan Mangrove Shore,
W80-03870 2I

Legal and Institutional Factors Affecting Mariculture in Texas,
W80-03873 6E

AQUATIC DRIFT
Seasonal Occurrence and Variation in Standing Crop of a Drift Algal Community in the Indian River, Florida,
W80-03803 5C

AQUATIC LIFE
Algal Growth Potential--Lower Willamette River, Oregon,
W80-03614 5B

A Review of the Lethal and Sub-Lethal Effects of Mercury on Aquatic Life,
W80-03683 5A

Investigations on the Effects of Domestic Sewage on the Benthic Ecosystem of Marine Intertidal Flats (In German),
W80-03684 5C

AQUATIC PLANTS
Extraction and Accumulation of 210Pb by Aquatic Organisms in Lakes,
W80-03677 5B

AQUATIC WEED CONTROL
Management of Elodea in Australian Irrigation Systems,
W80-03825 4A

Assessment of Aquatic Weed Problems,
W80-03826 4A

A New Approach for Salvinia Control,
W80-03827 4A

The Use of Multiple Inversion and Clean-Flo Lake Cleanser in Controlling Aquatic Plants,
W80-03828 4A

Establishment of Waterhyacinth Weevil Populations in Louisiana,
W80-03829 4A

Biological Control of Hydrilla Verticillata Royle with Grass Carp (Ctenopharyngodon Idella Val),
W80-03830 4A

Taxonomic Characteristics of Aquatic Plants from the Alimentary Tract of Grass Carp,
W80-03831 4A

Effects of Mechanical Cutting on Submersed Vegetation in a Louisiana Lake,
W80-03832 4A

Mechanical Hydrilla Control in Orange Lake, Florida,
W80-03833 4A

Formulating Aquatic Weed Management Programs,
W80-03841 4A

AQUATIC WEEDS
Seasonal Variation in the Biomass, Tuber Density, and Photosynthetic Metabolism of Hydrilla in Three Florida Lakes,
W80-03834 5C

AQUIFER CHARACTERISTICS
Geohydrologic Model of the Floridan Aquifer in the Southwest Florida Water Management District,
W80-03751 2F

Ground Water in the San Juan Basin, New Mexico and Colorado,
W80-03763 2F

Ground-Water Resources of Grant and Sioux Counties, North Dakota,
W80-03767 2F

AQUIFER MANAGEMENT
The Economic Consequences of Allocating Groundwater to Competing Interest in the Santa Cruz Basin, Pima County, Arizona,
W80-03707 6E

Geohydrologic Model of the Floridan Aquifer in the Southwest Florida Water Management District,
W80-03751 2F

Development of Ground Water in the Houston District, Texas, 1970-74,
W80-03768 4B

AQUIFERS
Preparation of Friable Aquiferous Specimens,
W80-03719 8E

Kinetics of Chemical Processes in a Carbonate Aquifer: A Case Study of Water-Rock Interaction in the Aquifer of Western and Central Galilee (Israel),
W80-03730 2K

Ocean Tide Effect Study on a Coastal Carbonate Aquifer (Miocene of Algarve, Portugal) ((Etude De L'Effet De Maree Oceanique Sur Un Aquifere Carbonate Cotier (Miocene De L'Algarve--Portugal)),
W80-03731 2F

ARCHAEOLOGY
A Cultural Resource Survey of the Teton Replacement Farmland, Jefferson County, Idaho,
W80-03778 6B

ARCHITECTURE
Residential Water Reuse,
W80-03640 3D

ARCTIC
Canadian-American Relations in the Arctic: The Effect of Environmental Influences Upon Territorial Claims,
W80-03852 6E

An Overview of Offshore Environmental Pollution Laws and Regulations in Canada, Greenland, and the North Sea,
W80-03896 5C

Sources and Characteristics of Liquid Process Wastes from Arctic Offshore Hydrocarbon Exploration,
W80-03898 5C

ARGOPECTEN
Copper Toxicity to the Bay Scallop (Argopecten Irradians),
W80-03689 5C

ARIZONA
Geophysical and Hydrologic Prediction of Fissuring and Land Subsidence, South-Central Arizona,
W80-03710 6A

ARKANSAS
Water-Quality Assessment of the L'Anguille River Basin, Arkansas,
W80-03758 5B

ARSENIC
Organochlorine, Fluorine, and Heavy-Metal Levels in Some Birds from New Zealand Estuaries,
W80-03691 5B

The Influence of Adsorption on the Rates of Microbial Degradation of Arsenic Species in Sediments,
W80-03692 5B

Geology and Geochemistry of Arsenic, Ester Dome Area, Alaska,
W80-03712 2K

ARSENIC COMPOUNDS
The Influence of Adsorption on the Rates of Microbial Degradation of Arsenic Species in Sediments,
W80-03692 5B

ARTESIAN AQUIFERS
Paul Spring: An Investigation of Recharge in the Roswell (NM) Artesian Basin,
W80-03642 2F

ARTIFICIAL SUBSTRATES
A Periphyton Growth Substrate Useful for Nutrient Impact Studies in Large Rivers,
W80-03665 5A

The Microdistribution of Epiphytes on the Leaves of Natural and Artificial Macrophytes,
W80-03798 5C

ASIA
The Ecology of Sandy Beaches in Penang, Malaysia, with Special Reference to Excirolana Orientalis (Dana),
W80-03633 2L

ATTENUATION
Phytoplankton Distribution and Light Attenuation in Port Hacking Estuary,
W80-03799 5C

AUSTRALIA
Management of Elodea in Australian Irrigation Systems,
W80-03825 4A

Wetlands of the South-West of Western Australia with Special Reference to the Busselton Area.
W80-03861 2L

AYU
Chemotherapeutical Studies on Trimethoprim Against Vibriosis of Pond-Cultured Ayu--II. Tissue Levels After Administration of Trimethoprim-Sulfadoxine Mixture (In Japanese),
W80-03693 5B

BACTERIA
An Artificial Microbial Ecosystem for Determining Effects and Fate of Toxicants in a Salt-Marsh Environment,
W80-03670 5A

Seasonal Changes of Bacterioplankton in a Reservoir Related to Algae. I. Numbers and Biomass,
W80-03811 5C

Distribution of Bacteria and Chlorophyll A at a Nearshore Station in Lake Ontario,
W80-03822 5C

The Transfer of Cadmium from Marine Heterotrophic Bacteria to Macoma Balthica,
W80-03897 5C

BACTERICIDES
Chemotherapeutical Studies on Trimethoprim Against Vibriosis of Pond-Cultured Ayu--II. Tissue Levels After Administration of Trimethoprim-Sulfadoxine Mixture (In Japanese),
W80-03693 5B

BASELINE STUDIES
Composition and Abundance of Phytoplankton in Tributaries of the Lower Colorado River, Grand Canyon Region,
W80-03890 5C

BASIC DATA COLLECTIONS
Selected Hydrologic Data for Spokane Valley, Spokane, Washington, 1977-78,
W80-03769 2F

Selected Water Resources Data, Clarion River and Red-Bank Creek Basins, Northwestern Pennsylvania--Part 2,
W80-03770 7C

BEACHES
Surf Zone Dynamics During Upwelling on the Oregon Coast,
W80-03632 2L

The Ecology of Sandy Beaches in Penang, Malaysia, with Special Reference to Excirolana Orientalis (Dana),
W80-03633 2L

BED LOAD
A Reexamination of Bagnold's Granular-Fluid Model and Bed Load Transport Equation,
W80-03625 2J

BEDS
Damping of Gravity Waves over Porous Bed,
W80-03716 8B

BEHAVIOR
Systems Ecology, People Ecology, and the Anthropology of Fishing Communities,
W80-03860 6B

BENEFICIAL USE
Algae Grown on Wastewater as a Source of Protein for Young Chickens and Rats,
W80-03817 3C

BENEFITS
Hedonic Prices, Property Values and Measuring Environmental Benefits: A Survey of the Issues,
W80-03847 6B

BENTHIC FAUNA
Particle Reworking in Sediments from the New York Bight Apex: Evidence from 234Th/238U Disequilibrium,
W80-03629 2J

Effect of Tillage on Soil-Water Movement During Corn Growth,
W80-03724 2G

Soil and Water Losses from Corn-Soybean Rotations,
W80-03725 2J

CRUDE OIL
Identification of Organic Sulfur Compounds Transferred to Fish from Petroleum Suspension by Mass Chromatography,
W80-03671 5B

CRYSTAL LAKE (MN)
The Use of Multiple Inversion and Clean-Flo Lake Cleanser in Controlling Aquatic Plants,
W80-03828 4A

CULTIVATION
Effect of Tillage on Soil-Water Movement During Corn Growth,
W80-03724 2G

CULTURES
Application of in Situ Cage Cultures of Phytoplankton for Monitoring Heavy Metal Pollution in Two Norwegian Fjords,
W80-03800 5C

CULVERTS
Erosional Aspects of Managing Urban Streams,
W80-03773 2J

CURRENTS (WATER)
The Sublittoral Ecology of the Menai Strait, I. Temporal and Spatial Variation in the Fauna and Flora Along a Transect,
W80-03634 2L

CYSTOSEIRA
Effect of Some Chemical Agents on the Uptake of 32p and 65Zn by Macrophytes in the Black Sea,
W80-03662 5B

DAPHNIA
Variation in the Reactions of Daphnia Magna Straus to the Effect of a Toxicant as Related to Its Delivery Regime,
W80-03676 5A

DATA COLLECTIONS
Index to Sources of Hydrologic Data,
W80-03744 7C

Hydrologic Data for Wells, Springs, and Streams in Boulder County, Colorado,
W80-03757 2A

Instrumentation of Urban Hydrology Monitoring Sites in Southeast Florida,
W80-03766 7B

Assessment of Aquatic Weed Problems,
W80-03826 4A

DATA STORAGE AND RETRIEVAL
Estimating Water Treatment Costs, Volume 4. Computer User's Manual for Retrieving and Updating Cost Data,
W80-03655 5F

DATING
A Cultural Resource Survey of the Teton Replacement Farmland, Jefferson County, Idaho,
W80-03778 6B

DDT
The Absorption of DDT by Vascular Aquatic Plants,
W80-03663 5B

DDVP
Pesticides and Aquatic Ecosystems,
W80-03699 5C

DECISION MAKING
River-Quality Assessment: Concept, Framework, and Application in the Willamette River Basin, Oregon,
W80-03608 6B

Estimating Willingness to Pay: Why and How.,
W80-03846 6B

Adaptive Economics and Natural Resources Policy,
W80-03854 6B

DECISION-MAKING CRITERIA
Guidelines for Socioeconomic Impact Analyses of Environmental Regulations,
W80-03602 6C

DEMAND
Estimating Willingness to Pay: Why and How.,
W80-03846 6B

DENSITY
Zooplankton in a Quasi-Stable Phase in an Endorheic Lake (Lake Chilwa, Malawi),
W80-03807 5C

DESALINATION
Low Pressure Brackish Water Reverse Osmosis Membrane Development - Final Report,
W80-03749 3A

Design of an Indirect Freezing Process Pilot Plant Based on Bulk Crystallization,
W80-03772 3A

DESALINATION PLANTS
Technical and Economic Assessment of Solar Distillation for Large Scale Production in Fresh Water.
W80-03842 3A

DESALINATION PROCESSES
Technical and Economic Assessment of Solar Distillation for Large Scale Production in Fresh Water.
W80-03842 3A

DESTRATIFICATION
Influence of the Shelf-Break Front off Nova Scotia on Phytoplankton Standing Stock in Winter,
W80-03809 5C

The Use of Multiple Inversion and Clean-Flo Lake Cleanser in Controlling Aquatic Plants,
W80-03828 4A

DEVELOPING COUNTRIES
The Analysis of Risk in Irrigation Projects in Developing Countries,
W80-03851 6B

Multinational Corporations, Nation-States and Ocean Resource Management: The Impact of the World's 200-Mile Economic Zone on Multinational and National Development,
W80-03859 6E

DIATOMS
Taxonomic Notes on Epiphytic Diatoms of Mississippi Sound, U.S.A.,
W80-03781 5C

Application of in Situ Cage Cultures of Phytoplankton for Monitoring Heavy Metal Pollution in Two Norwegian Fjords,
W80-03800 5C

Species Composition and Seasonal Occurence of Centric Diatoms in a Polluted Marine Environment,
W80-03820 5C

DIBENZOTHIOPHENES
Identification of Organic Sulfur Compounds Transferred to Fish from Petroleum Suspension by Mass Chromatography,
W80-03671 5B

DIFFUSERS
Staged Multiport Diffusers,
W80-03717 5B

DIFFUSION
Staged Multiport Diffusers,
W80-03717 5B

Sediments Suspended in Stream Flow,
W80-03718 2J

DIGESTION
Taxonomic Characteristics of Aquatic Plants from the Alimentary Tract of Grass Carp,
W80-03831 4A

DINOFLAGELLATES
Effects of Dinoflagellate Bioluminescence on the Ingestion Rates of Herbivorous Zooplankton,
W80-03782 5C

DISINFECTION
Disinfection/Treatment of Combined Sewer Overflows, Syracuse, New York,
W80-03651 5D

Comparison of Ozone Contactors for Municipal Wastewater Effluent Disinfection -- Packed Column Versus Jet Scrubber,
W80-03653 5D

Effect of Particulates on Ozone Disinfection of Bacteria and Viruses in Water,
W80-03654 5F

DISPERSION
Verifying Lake Transport Models with Special Statistics,
W80-03836 2H

DISSOLVED OXYGEN
Fish Mortality and Fishing During an Unprecedented Draught in Lake Pichhola, Udaipur,
W80-03698 2H

DISTILLATION
Technical and Economic Assessment of Solar Distillation for Large Scale Production in Fresh Water.
W80-03842 3A

DISTRIBUTION
Flow in the Sea of Heavy Metals from a Smelter Industry,
W80-03788 5B

The Distribution of Algal Epiphytes on Macrophyte Hosts Offshore from La Parguera, Puerto Rico,
W80-03797 5C

The Microdistribution of Epiphytes on the Leaves of Natural and Artificial Macrophytes,
W80-03798 5C

Phytoplankton Distribution and Light Attenuation in Port Hacking Estuary,
W80-03799 5C

Zooplankton in a Quasi-Stable Phase in an Endorheic Lake (Lake Chilwa, Malawi),
W80-03807 5C

DISTRIBUTION PATTERNS
Seasonal Occurrence and Variation in Standing Crop of a Drift Algal Community in the Indian River, Florida,
W80-03803 5C

A Lowland Vegetation Sequence in South Westland: Pakihi Bog to Mixed Beech-Podocarp Forest. Part 1: The Principal Strata,
W80-03867 2I

Distribution of Macrofauna on a Malayan Mangrove Shore,
W80-03870 2I

Factors Affecting Tissue Nutrient Concentrations in a Scirpus-Equisetum Wetland,
W80-03876 2I

Pattern and Diversity in Swamp and Dune Vegetation, North Stradbroke Island,
W80-03882 2I

DOMESTIC USE
Residential Water Reuse,
W80-03640 3D

DOMESTIC WASTES
Residential Water Reuse,
W80-03640 3D

Characteristics of Effluents from Gray and Black Water Septic Tanks,
W80-03791 5B

DOMINANT ORGANISMS
The Effect of the Degree of Mineralization of Water on Phytoplankton,
W80-03664 5A

The Distribution and Ecology of the Naididae (Oligochaeta) Which Inhabit the Filter-Beds of Sewage-Works in Britain,
W80-03666 5C

DORMANCY
Effects of Temperature and Salinity on Production and Hatching of Dormant Eggs of Acartia Californiensis (Copepoda) in an Oregon Estuary,
W80-03700 5A

DRAWDOWN
Development of Ground Water in the Houston District, Texas, 1970-74,
W80-03768 4B

DREDGING
Suspended Material Distributions in the Wake of Estuarine Channel Dredging Operations,
W80-03631 2J

The Effects of Oyster Shell Dredging on an Estuarine Benthic Community,
W80-03734 2L

DROUGHTS
Statistical Analysis of Hydrologic Critical Droughts,
W80-03618 2E

On the Assessment of Crop Droughts: A Case Study for Disa (Gujarat),
W80-03637 2B

Fish Mortality and Fishing During an Unprecedented Draught in Lake Pichhola, Udaipur,
W80-03698 2H

Impacts of the Western Drought on the Regional Electricity Situation.
W80-03843 6D

DUNES
Pattern and Diversity in Swamp and Dune Vegetation, North Stradbroke Island,
W80-03882 2I

ECOLOGICAL DISTRIBUTION
The Ecology of a Saltmarsh in Sri Lanka,
W80-03871 2I

ECOLOGY
The Ecology of a Saltmarsh in Sri Lanka,
W80-03871 2I

ECONOMIC ANALYSIS
Estimating Water Treatment Costs, Volume 4. Computer User's Manual for Retrieving and Updating Cost Data,
W80-03655 5F

ECONOMIC EFFICIENCY
Pigovian Taxes, Polluter Subsidies, Regulation, and the Size of a Polluting Industry,
W80-03848 6E

What Can We Get From Effluent Charges,
W80-03849 6B

The Analysis of Risk in Irrigation Projects in Developing Countries,
W80-03851 6B

ECONOMICS
The Economic Consequences of Allocating Groundwater to Competing Interest in the Santa Cruz Basin, Pima County, Arizona,
W80-03707 6E

Formulating Aquatic Weed Management Programs,
W80-03841 4A

A Bioeconomic Model of the Gulf of Mexico Shrimp Fishery,
W80-03845 8I

The Analysis of Risk in Irrigation Projects in Developing Countries,
W80-03851 6B

Adaptive Economics and Natural Resources Policy,
W80-03854 6B

Environmental Management in General Equilibrium: A New Incentive Compatible Approach,
W80-03855 6B

Environmental Quality and Economic Development,
W80-03857 6E

Systems Ecology, People Ecology, and the Anthropology of Fishing Communities,
W80-03860 6B

ECOSYSTEMS
Pesticides and Aquatic Ecosystems,
W80-03699 5C

Very Simple Model of the Initial Stage of Oligotrophic-Eutrophic Succession. In Bodies of Water,
W80-03792 5A

Incorporation, Distribution and Fate of Saturated Petroleum Hydrocarbons in Sediments from a Controlled Marine Ecosystem,
W80-03899 5C

ECOTYPES
Body Size and Feeding Ecology as Alternatives to Taxonomy for the Study of Limnetic Zooplankton Community Structure,
W80-03815 5A

EDTA
In Vitro Inhibition of Three Phosphatases by Mercuric Chloride and Their Reversal by Chelating Agent EDTA,
W80-03685 5A

EELGRASS
Consumption of Eelgrass, Zostera Marina, by Birds and Invertebrates During the Growing Season in Lake Grevelingen (SW Netherlands),
W80-03819 5C

EELS
Identification of Organic Sulfur Compounds Transferred to Fish from Petroleum Suspension by Mass Chromatography,
W80-03671 5B

EFFECTS
The Effects of Oyster Shell Dredging on an Estuarine Benthic Community,
W80-03734 2L

EFFLUENTS
Staged Multiport Diffusers,
W80-03717 5B

Characteristics of Effluents from Gray and Black Water Septic Tanks,
W80-03791 5B

What Can We Get From Effluent Charges,
W80-03849 6B

EGERIA DENSA
Photosynthesis in the Aquatic Macrophyte Egeria Densa. III Gas Exchange Studies,
W80-03806 5C

ELECTROMAGNETIC VELOCITY METER
Instrumentation of Urban Hydrology Monitoring Sites in Southeast Florida,
W80-03766 7B

ELECTRON MICROSCOPY
Taxonomic Notes on Epiphytic Diatoms of Mississippi Sound, U.S.A.,
W80-03781 5C

EMERGENT PLANTS
The Nutritional Ecology of Cyperus Esculentus, an Emergent Aquatic Plant, Grown on Different Sediments,
W80-03786 2I

ENERGY
Chemical Fluctuations Due to Seasonal and Cropping Effects on an Algal-Seagrass Community,
W80-03785 2I

ENERGY CONVERSION
Photosynthetically Active Radiation in a Stand of Phragmites Communis Trin. II. Model of Light Extinction in the Stand,
W80-03869 2H

ENVIRONMENT
Environmental Protection for Whom,
W80-03853 6B

Environmental Management in General Equilibrium: A New Incentive Compatible Approach,
W80-03855 6B

ENVIRONMENTAL CONTROL
Environmental Quality and Economic Development,
W80-03857 6E

ENVIRONMENTAL EFFECTS
Methods of Estimating Some Possible Interactions of Agricultural Development and Water Resources in Alaska,
W80-03711 2A

Erosional Aspects of Managing Urban Streams,
W80-03773 2J

Effects of Oil on Marine Phytoplankton Communities,
W80-03895 5C

The Transfer of Cadmium from Marine Heterotrophic Bacteria to Macoma Balthica,
W80-03897 5C

ENZYMES
In Vitro Inhibition of Three Phosphatases by Mercuric Chloride and Their Reversal by Chelating Agent EDTA,
W80-03685 5A

EPIPHYTIC ALGAE
Taxonomic Notes on Epiphytic Diatoms of Mississippi Sound, U.S.A.,
W80-03781 5C

EPIPHYTOLOGY
The Distribution of Algal Epiphytes on Macrophyte Hosts Offshore from La Parguera, Puerto Rico,
W80-03797 5C

The Microdistribution of Epiphytes on the Leaves of Natural and Artificial Macrophytes,
W80-03798 5C

A Nutritional Analysis of a Sublittoral Diatom Assemblage Epiphytic on Enteromorpha from a Long Island Salt Marsh,
W80-03862 2I

EPIZOOTIOLOGY
Aeromonas Distribution and Survival in a Thermally Altered Lake,
W80-03787 4A

EQUIPMENT
A Rainfall Simulator with Nonrepetitious Movement of Drop Outlets,
W80-03726 2B

The Design and Use of an Oscillating Trolley Wave-Simulator, for Installation in Unidirectional Flow Flumes,
W80-03737 2L

EROSION
Erosion Potential Assessment for the Willamette River Basin, Oregon,
W80-03613 7C

Erosional Aspects of Managing Urban Streams,
W80-03773 2J

EROSION CONTROL
Erosional Aspects of Managing Urban Streams,
W80-03773 2J

ESTER DOME AREA (ALASKA)
Geology and Geochemistry of Arsenic, Ester Dome Area, Alaska,
W80-03712 2K

ESTIMATING
Estimating Willingness to Pay: Why and How.,
W80-03846 6B

ESTUARIES
On the Calculation of the Width Averaged Flow Due to Long Waves in an Open Channel,
W80-03619 2E

Behaviour of Manganese in the Rhine and Scheldt Estuaries, II. Geochemical Cycling,
W80-03630 2L

Tidal Hydraulics in Estuarine Channels,
W80-03714 2L

Recent Geochemical History of Flood Deposits in the Northern Chesapeake Bay,
W80-03735 2J

Hydrochemistry of Dissolved Inorganic Carbon in the St. Lawrence Estuary (Canada),
W80-03736 2L

Incorporation, Distribution and Fate of Saturated Petroleum Hydrocarbons in Sediments from a Controlled Marine Ecosystem,
W80-03899 5C

ESTUARINE ENVIRONMENTS
Phytoplankton Distribution and Light Attenuation in Port Hacking Estuary,
W80-03799 5C

The Release of Reactive Phosphate by a Posidonia Australis Seagrass Community,
W80-03808 2A

Species Composition and Seasonal Occurence of Centric Diatoms in a Polluted Marine Environment,
W80-03820 5C

ESTUARING ENVIRONMENTS
Seasonal Occurrence and Variation in Standing Crop of a Drift Algal Community in the Indian River, Florida,
W80-03803 5C

EUPHOTIC ZONE
Nitrate and Phytoplankton Production in Southern California Coastal Waters,
W80-03789 5C

EURASIAN WATERMILFOIL
British Columbia Aquatic Plant Management Program,
W80-03840 4A

EUTROPHICATION
Phosphrus Export from Rural Maine Watersheds,
W80-03776 5B

A Nine-Year Study of the Phytoplankton of the Eutrophic and Non-Stratifying Loch Leven (Kinross, Scotland),
W80-03816 5C

EVAPOTRANSPIRATION
On the Assessment of Crop Droughts: A Case Study for Disa (Gujarat),
W80-03637 2B

Measuring Evapotranspiration of Turfgrass,
W80-03646 2D

EXCREMENT
Microbial Impact of Canada Geese (Branta Canadensis) and Whistling Swans (Cygnus Columbianus Columbianus) on Aquatic Ecosystems,
W80-03794 5B

EXPLORATION
Sources and Characteristics of Liquid Process Wastes from Arctic Offshore Hydrocarbon Exploration,
W80-03898 5C

FAULTS (GEOLOGIC)
Structural Controls of Hot-Spring Systems in Southwestern Montana,
W80-03760 1A

FEDERAL JURISDICTION
The Federal Reserved Rights Doctrine - from 1866 Through Eagle County,
W80-03777 6E

FEDERAL RECLAMATION LAW
Reborn Federalism in Western Water Law: The New Melones Dam Decision,

W80-03814 6E

State Control Over Federal Reclamation Projects,
W80-03823 6E

FEDERAL WATER POLLUTION CONTROL ACT
Liability for Oil Pollution - United States Law,
W80-03667 6E

Will Judicial Error Allow Industrial Point Sources to Avoid BPT and Perhaps BAT Later. A Story of Good Intentions, Bad Dictum, and Ugly Consequences,
W80-03885 6E

FEEDS
Algae Grown on Wastewater as a Source of Protein for Young Chickens and Rats,
W80-03817 3C

Secondary Toxicology and Contaminants of Algae Grown on Wastewater,
W80-03818 3C

FINANCIAL FEASIBILITY
Financial Statement Modeling: Analyzing the Pollution-Control Tax Incentive,
W80-03850 6B

FISH BARRIERS
Effects of Dams and Impoundments on Migrations of Juvenile Chinook Salmon and Steelhead from the Snake River, 1966 to 1975,
W80-03701 5A

FISH DISEASES
Chemotherapeutical Studies on Trimethoprim Against Vibriosis of Pond-Cultured Ayu--II. Tissue Levels After Administration of Trimethoprim-Sulfadoxine Mixture (In Japanese),
W80-03693 5B

Eye Damage to the Grass Carp (Ctenopharyngodon Idella) from Chronic Uptake of Strontium 90,
W80-03697 5C

FISH ESTABLISHMENT
Biological Control of Hydrilla Verticillata Royle with Grass Carp (Ctenopharyngodon Idella Val),
W80-03830 4A

FISH KIDNEY FUNCTION
A Method for Studying the Excretory Function of Fish Kidneys Under Chronic Experimental Conditions,
W80-03675 5A

FISH MIGRATIONS
Effects of Dams and Impoundments on Migrations of Juvenile Chinook Salmon and Steelhead from the Snake River, 1966 to 1975,
W80-03701 5A

FISH PARASITES
Aeromonas Distribution and Survival in a Thermally Altered Lake,
W80-03787 4A

FISH PHYSIOLOGY
A Method for Studying the Excretory Function of Fish Kidneys Under Chronic Experimental Conditions,
W80-03675 5A

The Effects of the Anaesthetic Quinaldine on Oxygen Consumption in an Intertidal Teleost Blennius Pholis (L.),
W80-03690 5A

FISH POPULATIONS
Aeromonas Distribution and Survival in a Thermally Altered Lake,
W80-03787 4A

FISH STOCKING
Biological Control of Hydrilla Verticillata Royle with Grass Carp (Ctenopharyngodon Idella Val),
W80-03830 4A

FISHKILLS
Fish Mortality and Fishing During an Unprecedented Draught in Lake Pichhola, Udaipur,
W80-03698 2H

FISSURES (GEOLOGIC)
Geophysical and Hydrologic Prediction of Fissuring and Land Subsidence, South-Central Arizona,
W80-03710 6A

FJORDS
Application of in Situ Cage Cultures of Phytoplankton for Monitoring Heavy Metal Pollution in Two Norwegian Fjords,
W80-03800 5C

FLOOD DAMAGE
A Cultural Resource Survey of the Teton Replacement Farmland, Jefferson County, Idaho,
W80-03778 6B

FLOOD PROTECTION
Water Resource Policies and Authorities: Federal Participation in Shore, Hurricane, Tidal and Lake Flood Protection (Final Rule).
W80-03877 6E

FLOOD ROUTING
A Generalized Approach to Kinematic Flood Routing,
W80-03732 2E

FLOOD WAVES
A Generalized Approach to Kinematic Flood Routing,
W80-03732 2E

FLOODS
Forecasting Storm Rainfall Over Bhagirathi Catchment Due to Depressions/Cyclonic Storms,
W80-03635 2B

Recent Geochemical History of Flood Deposits in the Northern Chesapeake Bay,
W80-03735 2J

A Technique for Estimating Heights Reached by the 100-Year Flood on Unregulated, Nontidal Streams in North Carolina,
W80-03764 2E

FLORIDA
The Effects of Oyster Shell Dredging on an Estuarine Benthic Community,
W80-03734 2L

Water Resources Data for Florida, Water Year 1978--Volume 3A-1. Southwest Florida Surface Water.
W80-03754 7C

Water Resources Data for Florida, Water Year 1978--Volume 3A-2. Southwest Florida Surface Water Quality.
W80-03755 7C

Water Resources Data for Florida, Water Year 1978--Volume 3B. Southwest Florida Ground Water.
W80-03756 7C

Surface-Water Features in Osceola County and Adjacent Areas, Florida,
W80-03761 7C

Instrumentation of Urban Hydrology Monitoring Sites in Southeast Florida,
W80-03766 7B

Holocene Sedimentation at Cape Sable, South Florida,
W80-03864 2J

Comparative Biomass and Growth of Cypress in Florida Wetlands,
W80-03866 2I

FLOTATION
Manganese Removal from Water by Flotation with Microgas Dispersions,
W80-03748 5F

FLOW
Measurements of Combined Oscillatory and Steady Flow Over a Rough Bed,
W80-03620 8B

Observations of Stratified Flow Past Three-Dimensional Barriers,
W80-03624 8B

Air Bubbles in a Convectively Accelerated Water Flow,
W80-03740 8B

FLOW AROUND OBJECTS
Observations of Stratified Flow Past Three-Dimensional Barriers,
W80-03624 8B

FLOW CHARACTERISTICS
Hydraulics of Flow in the Kaskaskia River, Illinois,
W80-03713 2E

Low-Flow Characteristics of Streams in the Pecatonica-Sugar River Basin, Wisconsin,
W80-03765 2E

FLOW CONTROL
Flow Control Devices Particularly Useful for Drip Irrigation,
W80-03604 3F

FLOW SEPARATION
Flow Visualization in Complex Turbulent Flows,
W80-03715 8B

FLOW VISUALIZATION
Flow Visualization in Complex Turbulent Flows,
W80-03715 8B

FLUCTUATIONS
Seasonal Variations in Net Photosynthetic Performance and Cover of Intertidal Macrophytes,
W80-03660 5C

FLUMES
The Design and Use of an Oscillating Trolley Wave-Simulator, for Installation in Unidirectional Flow Flumes,
W80-03737 2L

FLUORENE DERIVATIVES
Mutagenicity of Fluorene Derivatives: A Proposed Mechanism,
W80-03745 5A

FLUORINE
Organochlorine, Fluorine, and Heavy-Metal Levels in Some Birds from New Zealand Estuaries,
W80-03691 5B

FOOD CHAINS
Transfer of 14C-Toluene from Mosquito Larvae to Bluegill Sunfish,
W80-03686 5B

Two Electivity Indices for Feeding with Special Reference to Zooplankton Grazing,
W80-03810 5C

Consumption of Eelgrass, Zostera Marina, by Birds and Invertebrates During the Growing Season in Lake Grevelingen (SW Netherlands),
W80-03819 5C

The Transfer of Cadmium from Marine Heterotrophic Bacteria to Macoma Balthica,
W80-03897 5C

FOOD HABITS
Carnivorous Feeding Behavior of the Adult Calanoid Copepod Acartia Tonsa Dana,
W80-03783 5C

Two Electivity Indices for Feeding with Special Reference to Zooplankton Grazing,
W80-03810 5C

Body Size and Feeding Ecology as Alternatives to Taxonomy for the Study of Limnetic Zooplankton Community Structure,
W80-03815 5A

FORECASTING
Forecasting Storm Rainfall Over Bhagirathi Catchment Due to Depressions/Cyclonic Storms,
W80-03635 2B

Chesapeake Bay Future Conditions Report. Appendix 3. Economic and Social Profile.
W80-03844 6B

FOREST
A Lowland Vegetation Sequence in South Westland: Pakihi Bog to Mixed Beech-Podocarp Forest. Part 1: The Principal Strata,
W80-03867 2I

FREEZING
Design of an Indirect Freezing Process Pilot Plant Based on Bulk Crystallization,
W80-03772 3A

FRONTS (OCEANIC)
The Islay Front: Physical Structure and Phytoplankton Distribution,
W80-03733 2L

FROZEN SOILS
Snowmelt Infiltration Into Seasonally Frozen Soils,
W80-03650 2G

FRY
Studies on the Effects of Acidic Medium on the Fry of Cyprinus Carpio,
W80-03706 5A

GALVESTON BAY
A Bioeconomic Model of the Gulf of Mexico Shrimp Fishery,
W80-03845 8I

GALVESTON COUNTY (TEX)
Development of Ground Water in the Houston District, Texas, 1970-74,
W80-03768 4B

GEOCHEMISTRY
Mixing Models and Ionic Geothermometers Applied to Warm (Up to 60C) Springs: Jordan Rift Valley, Israel,
W80-03728 2K

GEOLOGIC MAPPING
Geology and Geochemistry of Arsenic, Ester Dome Area, Alaska,
W80-03712 2K

GEOLOGY
Ground Water in the San Juan Basin, New Mexico and Colorado,
W80-03763 2F

GEOMORPHOLOGY
The Geomorphologic Structure of Hydrologic Response,
W80-03743 2A

GEORGIA
River-Quality Assessments.
W80-03606 5B

An Interim Report on the Intensive River-Quality Assessment of the Upper Chattahoochee River Basin, Georgia,
W80-03609 5B

Thermal Modeling of Highly Transient Flows in the Chattahoochee River Near Atlanta, Georgia,
W80-03615 2E

GEOTHERMAL STUDIES
Mixing Models and Ionic Geothermometers Applied to Warm (Up to 60C) Springs: Jordan Rift Valley, Israel,
W80-03728 2K

Structural Controls of Hot-Spring Systems in Southwestern Montana,
W80-03760 1A

GEOTHERMOMETERS
Mixing Models and Ionic Geothermometers Applied to Warm (Up to 60C) Springs: Jordan Rift Valley, Israel,
W80-03728 2K

GRAND CANYON (AR-UT)
Composition and Abundance of Phytoplankton in Tributaries of the Lower Colorado River, Grand Canyon Region,
W80-03890 5C

GRANT COUNTY (N DAK)
Ground-Water Resources of Grant and Sioux Counties, North Dakota,
W80-03767 2F

GRAVITY WAVES
Damping of Gravity Waves over Porous Bed,
W80-03716 8B

GRAZING
Effects of Dinoflagellate Bioluminescence on the Ingestion Rates of Herbivorous Zooplankton,
W80-03782 5C

Two Electivity Indices for Feeding with Special Reference to Zooplankton Grazing,
W80-03810 5C

GREAT LAKES
Incidents of Elevated Nitrate in Southern Ontario,
W80-03623 5B

GROUND-WATER RESOURCES
Geohydrologic Model of the Floridan Aquifer in the Southwest Florida Water Management District,
W80-03751 2F

GROUNDWATER
Comparative Study of Groundwater Recharge Rates in Parts of Indo-Gangetic and Sabarmati Alluvial Plains,
W80-03636 2F

Proceedings of the Twelfth Biennial Conference on Groundwater, Sacramento, September 20-21, 1979.
W80-03641 4B

Ocean Tide Effect Study on a Coastal Carbonate Aquifer (Miocene of Algarve, Portugal) ((Etude De L'Effet De Maree Oceanique Sur Un Aquifere Carbonate Cotier (Miocene De L'Algarve--Portugal)),
W80-03731 2F

Water Resources Data for Indiana, Water Year 1978.
W80-03752 7C

Water Resources Data for Alaska, Water Year 1978.
W80-03753 7C

Water Resources Data for Florida, Water Year 1978--Volume 3B. Southwest Florida Ground Water.
W80-03756 7C

Hydrologic Data for Wells, Springs, and Streams in Boulder County, Colorado,
W80-03757 2A

Places in Connecticut Where Ground Water is Known to Have Deteriorated in Quality,
W80-03762 7C

Ground Water in the San Juan Basin, New Mexico and Colorado,
W80-03763 2F

Development of Ground Water in the Houston District, Texas, 1970-74,
W80-03768 4B

Selected Hydrologic Data for Spokane Valley, Spokane, Washington, 1977-78,
W80-03769 2F

GROUNDWATER AVAILABILITY
Proceedings of the Twelfth Biennial Conference on Groundwater, Sacramento, September 20-21, 1979.
W80-03641 4B

GROUNDWATER BASINS
Proceedings of the Twelfth Biennial Conference on Groundwater, Sacramento, September 20-21, 1979.
W80-03641 4B

GROUNDWATER MANAGEMENT
Proceedings of the Twelfth Biennial Conference on Groundwater, Sacramento, September 20-21, 1979.
W80-03641 4B

GROUNDWATER MOVEMENT
Geohydrologic Model of the Floridan Aquifer in the Southwest Florida Water Management District,
W80-03751 2F

GROUNDWATER POTENTIAL
Proceedings of the Twelfth Biennial Conference on Groundwater, Sacramento, September 20-21, 1979.
W80-03641 4B

GROUNDWATER RECHARGE
Comparative Study of Groundwater Recharge Rates in Parts of Indo-Gangetic and Sabarmati Alluvial Plains,
W80-03636 2F

Proceedings of the Twelfth Biennial Conference on Groundwater, Sacramento, September 20-21, 1979.
W80-03641 4B

Hydrology of Small Oceanic Islands--Utility of an Estimate of Recharge Inferred from the Chloride Concentration of the Freshwater Lenses,
W80-03729 2F

GROUNDWATER RESOURCES
Proceedings of the Twelfth Biennial Conference on Groundwater, Sacramento, September 20-21, 1979.
W80-03641 4B

Ground-Water Resources of Grant and Sioux Counties, North Dakota,
W80-03767 2F

Selected Water Resources Data, Clarion River and Red-Bank Creek Basins, Northwestern Pennsylvania--Part 2,
W80-03770 7C

GROWTH RATES
Dependence of the Time of Gamete Maturation and Spawning on Environmental Temperature in the Virginia Oyster Crassostrea Virginica,
W80-03679 5C

The Relationship Between Vertebral Number and Water Temperature in Cod,
W80-03680 5A

Phytomechanics--Plant Physiology and Applied Mechanics,
W80-03780 2I

The Nutritional Ecology of Cyperus Esculentus, an Emergent Aquatic Plant, Grown on Different Sediments,
W80-03786 2I

Temperature Effects on Steady-State Growth, Phosphorus Uptake, and the Chemical Composition of a Marine Phytoplankter,
W80-03804 5C

GUJARAT STATE (INDIA)
Does Precipitation Pattern Foretell Gujarat Climate Becoming Arid,
W80-03638 2B

GULF OF MEXICO
Some Aspects of the Oceanography of the Gulf of Mexico Using Satellite and in Situ Data,
W80-03628 2L

HARBORS
Species Composition and Seasonal Occurence of Centric Diatoms in a Polluted Marine Environment,
W80-03820 5C

HARRIS COUNTY (TEX)
Development of Ground Water in the Houston District, Texas, 1970-74,
W80-03768 4B

HARVESTING
Experimental Ecology with Particular Reference to Proposed Commercial Harvesting of Durvillaea (Phaeophyta, Durvilleales) in New Zealand,
W80-03802 2I

Effects of Mechanical Cutting on Submersed Vegetation in a Louisiana Lake,
W80-03832 4A

Mechanical Hydrilla Control in Orange Lake, Florida,
W80-03833 4A

HATCHING
Effects of Temperature and Salinity on Production and Hatching of Dormant Eggs of Acartia Californiensis (Copepoda) in an Oregon Estuary,
W80-03700 5A

HEAT TRANSFER
An Analysis of the Irreversible Thermodynamics Model for Coupled Heat and Moisture Transport Phenomena in Unsaturated Porous Media,
W80-03639 1A

HEATED WATER
Aeromonas Distribution and Survival in a Thermally Altered Lake,
W80-03787 4A

HEAVY METALS
Organochlorine, Fluorine, and Heavy-Metal Levels in Some Birds from New Zealand Estuaries,
W80-03691 5B

The Field Assessment of Effects of Dumping Wastes at Sea: 3. A Survey of the Sewage Sludge Disposal Area in Lyme Bay,
W80-03696 5A

The Influence of Urbanization of the Transport of Heavy Metals in New Jersey Streams,
W80-03774 5B

Flow in the Sea of Heavy Metals from a Smelter Industry,
W80-03788 5B

Application of in Situ Cage Cultures of Phytoplankton for Monitoring Heavy Metal Pollution in Two Norwegian Fjords,
W80-03800 5C

Effects of Mine Drainage on the River Hayle, Cornwall (A) Factors Affecting Concentrations of Copper, Zinc and Iron in Water, Sediments and Dominant Invertebrate Fauna,
W80-03891 5C

HERBICIDES
Management of Elodea in Australian Irrigation Systems,
W80-03825 4A

A New Approach for Salvinia Control,
W80-03827 4A

Adsorption-Desorption of Diuron by Freshwater Sediments,
W80-03838 5B

British Columbia Aquatic Plant Management Program,
W80-03840 4A

HEXACHLORANE
The Reaction of Phragmites Communis Roots to DDT and Hexachlorane,
W80-03661 5C

HISTORY
Age, Origin, and Palaeo-Ecological Evidence of Blanket Bogs in Nord-Trondelag, Norway,
W80-03868 2J

Diatom Floristics and Succession in a Peat Bog Near Lily Lake, Summit County, Utah,
W80-03872 2H

HOSTS
The Distribution of Algal Epiphytes on Macrophyte Hosts Offshore from La Parguera, Puerto Rico,
W80-03797 5C

HOT SPRINGS
Structural Controls of Hot-Spring Systems in Southwestern Montana,
W80-03760 1A

HOUSTON DISTRICT
Development of Ground Water in the Houston District, Texas, 1970-74,
W80-03768 4B

HUMAN PATHOLOGY
Secondary Toxicology and Contaminants of Algae Grown on Wastewater,
W80-03818 3C

HYDRAULIC CONDUCTIVITY
Hydraulic Conductivity of Mountain Soils,
W80-03775 2C

HYDRAULIC STRUCTURES
Hydraulics of Rectangular Vertical Drop Structures,
W80-03739 2E

HYDRODYNAMICS
Formulating Lake Models Which Preserve Spectral Statistics,
W80-03605 2H

Verifying Lake Transport Models with Special Statistics,
W80-03836 2H

HYDROELECTRIC POWER
Impacts of the Western Drought on the Regional Electricity Situation.
W80-03843 6D

HYDROGEOLOGY
Ocean Tide Effect Study on a Coastal Carbonate Aquifer (Miocene of Algarve, Portugal) ((Etude De L'Effet De Maree Oceanique Sur Un Aquifere Carbonate Cotier (Miocene De L'Algarve--Portugal)),
W80-03731 2F

Ground Water in the San Juan Basin, New Mexico and Colorado,
W80-03763 2F

HYDROLOGIC ASPECTS
Toward a Conceptual Framework for River-Quality Trend and Cause-Effect Analysis,
W80-03611 5B

HYDROLOGIC DATA
Index to Sources of Hydrologic Data,
W80-03744 7C

Water Resources Data for Indiana, Water Year 1978.
W80-03752 7C

Water Resources Data for Alaska, Water Year 1978.
W80-03753 7C

Water Resources Data for Florida, Water Year 1978--Volume 3A-1. Southwest Florida Surface Water.
W80-03754 7C

Water Resources Data for Florida, Water Year 1978--Volume 3A-2. Southwest Florida Surface Water Quality.
W80-03755 7C

Water Resources Data for Florida, Water Year 1978--Volume 3B. Southwest Florida Ground Water.
W80-03756 7C

Hydrologic Data for Wells, Springs, and Streams in Boulder County, Colorado,
W80-03757 2A

Selected Hydrologic Data for Spokane Valley, Spokane, Washington, 1977-78,
W80-03769 2F

Selected Water Resources Data, Clarion River and Red-Bank Creek Basins, Northwestern Pennsylvania--Part 2,
W80-03770 7C

Interim Progress Report Supplement a -- Data Analysis, SCPP Data Collection and Analysis for the Period 1 January 1979 Through 30 June 1979,
W80-03779 3B

HYDROLOGIC PROPERTIES
Surface-Water Features in Osceola County and Adjacent Areas, Florida,
W80-03761 7C

HYSTERESIS
A Hysteresis Model Based on an Explicit Domain-Dependence Function,
W80-03720 2G

IDAHO
A Cultural Resource Survey of the Teton Replacement Farmland, Jefferson County, Idaho,
W80-03778 6B

Stream Types in Idaho: An Approach to Classification of Streams in Natural Areas,
W80-03835 6B

ILLINOIS
Hydraulics of Flow in the Kaskaskia River, Illinois,
W80-03713 2E

IMPAIRED WATER USE
Residential Water Reuse,
W80-03640 3D

IMPOUNDED WATERS
Prediction of the Quality of Water in a Proposed Impoundment in Southwestern Wisconsin, USA,
W80-03801 5B

IMPOUNDMENTS
Prediction of the Quality of Water in a Proposed Impoundment in Southwestern Wisconsin, USA,
W80-03801 5B

INCOME DISTRIBUTION
Fishermen's Remuneration Systems and Implications for Fisheries Development,
W80-03858 6C

INDIA
Forecasting Storm Rainfall Over Bhagirathi Catchment Due to Depressions/Cyclonic Storms,
W80-03635 2B

Comparative Study of Groundwater Recharge Rates in Parts of Indo-Gangetic and Sabarmati Alluvial Plains,
W80-03636 2F

On the Assessment of Crop Droughts: A Case Study for Disa (Gujarat),
W80-03637 2B

Does Precipitation Pattern Foretell Gujarat Climate Becoming Arid,
W80-03638 2B

Fish Mortality and Fishing During an Unprecedented Draught in Lake Pichhola, Udaipur,
W80-03698 2H

INDIAN RESERVATIONS
Sale and Lease of Indian Water Rights,
W80-03880 6E

INDIAN RIVER (FL)
Seasonal Occurrence and Variation in Standing Crop of a Drift Algal Community in the Indian River, Florida,
W80-03803 5C

INDIANA
Water Resources Data for Indiana, Water Year 1978.
W80-03752 7C

INDUSTRIAL WASTES
Mutagens in a River Heavily Polluted with Paper Recycling Wastes: Results of Field and Laboratory Mutagen Assays,
W80-03746 5A

Application of in Situ Cage Cultures of Phytoplankton for Monitoring Heavy Metal Pollution in Two Norwegian Fjords,
W80-03800 5C

INDUSTRIAL WATER
The Potential for Municipal Wastewater Reuse by Industry in Massachusetts,
W80-03747 3C

INFILTRATION
Snowmelt Infiltration Into Seasonally Frozen Soils,
W80-03650 2G

Infiltration of Soils as Affected by the Pressure and Water Content at the Time of Compaction,
W80-03722 2G

Influence of a Compact Zone on Solute Transport During Infiltration of Water,
W80-03727 2G

INFRARED GAS ANALYSIS
Photosynthesis in the Aquatic Macrophyte Egeria Densa. III Gas Exchange Studies,
W80-03806 5C

INHIBITION
In Vitro Inhibition of Three Phosphatases by Mercuric Chloride and Their Reversal by Chelating Agent EDTA,
W80-03685 5A

The Effects of the Anaesthetic Quinaldine on Oxygen Consumption in an Intertidal Teleost Blennius Pholis (L.),
W80-03690 5A

Effects of Temperature and Salinity on Production and Hatching of Dormant Eggs of Acartia Californiensis (Copepoda) in an Oregon Estuary,
W80-03700 5A

INLETS (WATERWAYS)
Submarine Slide-Generated Water Waves in Kitimat Inlet, British Columbia,
W80-03627 2L

INSECTICIDES
Behavior of Abate in Microorganisms Isolated from Polluted Water,
W80-03892 5F

Organochlorine Insecticides and PCBs in Sediments of Lake St. Clair (1970 and 1974) and Lake Erie (1971),
W80-03894 5C

INSECTS
Comparison of the Assemblages of Sap-Feeding Insects (Homoptera-Hemiptera) Inhabiting Two Structurally Different Salt Marsh Grasses in the Genus Spartina,
W80-03881 2I

INSTITUTIONS
Standards, Optimality and Resilience in Water-Resource Management,
W80-03750 6A

INSTRUMENTATION
Instrumentation of Urban Hydrology Monitoring Sites in Southeast Florida,
W80-03766 7B

INTERBASIN WATER TRANSFERS
An Interactive River Basin Water Management Model: Synthesis and Application,
W80-03708 6A

INTERFACES
On the Magnitude of Interfacial Shear of Subcritical Stratified Flows in Relation with Interfacial Stability,
W80-03738 2E

INTERNATIONAL COMMISSIONS
The Convention for the Prevention of Marine Pollution from Land-Based Sources: An Effective Method for Arbitrating International Effluent Pollution Disputes,
W80-03887 6E

INTERNATIONAL LAW
American Bar Association Resolution Re Natural Resources of the Sea Adopted by the House of Delegates, August 6, 1973 and Report of the Section of Natural Resources Law Recommending Adoption of the Resolution.
W80-03695 6E

The Convention for the Prevention of Marine Pollution from Land-Based Sources: An Effective Method for Arbitrating International Effluent Pollution Disputes,
W80-03887 6E

INTERNATIONAL WATERS
Canadian-American Relations in the Arctic: The Effect of Environmental Influences Upon Territorial Claims,
W80-03852 6E

INTERSTITIAL WATER
An Empirical Model for Physical Parameters of Recent Sedimentary Deposits of Lake Ekoln and Lake Vanern,
W80-03790 5A

INTERTIDAL AREAS
Seasonal Variations in Net Photosynthetic Performance and Cover of Intertidal Macrophytes,
W80-03660 5C

INTERTIDAL ZONE
Holocene Sedimentation at Cape Sable, South Florida,
W80-03864 2J

INVERTEBRATES
Effects of Mine Drainage on the River Hayle, Cornwall (A) Factors Affecting Concentrations of Copper, Zinc and Iron in Water, Sediments and Dominant Invertebrate Fauna,
W80-03891 5C

INVESTMENT
Standards, Optimality and Resilience in Water-Resource Management,
W80-03750 6A

Financial Statement Modeling: Analyzing the Pollution-Control Tax Incentive,
W80-03850 6B

IRISH COAST
The Islay Front: Physical Structure and Phytoplankton Distribution,
W80-03733 2L

IRRIGATION
Enterovirus Inactivation in Soil and Structural Changes Associated with the Inactivation of Soil-Bound Viruses,
W80-03603 3C

Flow Control Devices Particularly Useful for Drip Irrigation,
W80-03604 3F

The Analysis of Risk in Irrigation Projects in Developing Countries,
W80-03851 6B

IRRIGATION CANALS
Hydraulics of Rectangular Vertical Drop Structures,
W80-03739 2E

Management of Elodea in Australian Irrigation Systems,
W80-03825 4A

IRRIGATION PROGRAMS
Litigation of the Reclamation Law in the Imperial Valley: Who Has Standing to Challenge Which Law,
W80-03888 3F

ISLANDS
Hydrology of Small Oceanic Islands--Utility of an Estimate of Recharge Inferred from the Chloride Concentration of the Freshwater Lenses,
W80-03729 2F

ISOPODS
The Ecology of Sandy Beaches in Penang, Malaysia, with Special Reference to Excirolana Orientalis (Dana),
W80-03633 2L

Consumption of Eelgrass, Zostera Marina, by Birds and Invertebrates During the Growing Season in Lake Grevelingen (SW Netherlands),
W80-03819 5C

ISRAEL
Mixing Models and Ionic Geothermometers Applied to Warm (Up to 60C) Springs: Jordan Rift Valley, Israel,
W80-03728 2K

Kinetics of Chemical Processes in a Carbonate Aquifer: A Case Study of Water-Rock Interaction in the Aquifer of Western and Central Galilee (Israel),
W80-03730 2K

An Evaluation of Marginal Waters as a Natural Resource in Israel,
W80-03742 3C

JACKSON LAKE (FL)
Seasonal Variation in the Biomass, Tuber Density, and Photosynthetic Metabolism of Hydrilla in Three Florida Lakes,
W80-03834 5C

JAPAN
Phytosociological Studies of Uryu-Numa Mire Studies of Upland Bog Vegetation in Hokkaido (II), (In Japanese),
W80-03874 2I

JUDICIAL DECISIONS
State Control Over Federal Reclamation Projects,
W80-03823 6E

KARACHI
Species Composition and Seasonal Occurence of Centric Diatoms in a Polluted Marine Environment,
W80-03820 5C

KASKASKIA RIVER (IL)
Hydraulics of Flow in the Kaskaskia River, Illinois,
W80-03713 2E

KENTUCKY BLUEGRASS
Measuring Evapotranspiration of Turfgrass,
W80-03646 2D

KICKAPOO RIVER (WI)
Prediction of the Quality of Water in a Proposed Impoundment in Southwestern Wisconsin, USA,
W80-03801 5B

KINETICS
Kinetics of Chemical Processes in a Carbonate Aquifer: A Case Study of Water-Rock Interaction in the Aquifer of Western and Central Galilee (Israel),
W80-03730 2K

Temperature Effects on Steady-State Growth, Phosphorus Uptake, and the Chemical Composition of a Marine Phytoplankter,
W80-03804 5C

KITIMAT INLET (BRITISH COLUMBIA)
Submarine Slide-Generated Water Waves in Kitimat Inlet, British Columbia,
W80-03627 2L

KLICAVA RESERVOIR
Seasonal Changes of Bacterioplankton in a Reservoir Related to Algae. I. Numbers and Biomass,
W80-03811 5C

KNAACK LAKE (WI)
Microbial Methanogenesis and Acetate Metabolism in a Meromictic Lake,
W80-03813 2H

LA PARGUERA
The Distribution of Algal Epiphytes on Macrophyte Hosts Offshore from La Parguera, Puerto Rico,
W80-03797 5C

LABOR SUPPLY
Employment in the Fishing Industry: Some Preliminary Findings on Fishermen's Mobility,
W80-03856 6F

LABORATORY EQUIPMENT
A Rainfall Simulator with Nonrepetitious Movement of Drop Outlets,
W80-03726 2B

The Design and Use of an Oscillating Trolley Wave-Simulator, for Installation in Unidirectional Flow Flumes,
W80-03737 2L

LABORATORY TESTS
Dissolved Oxygen and Biochemical Oxygen Demand,
W80-03612 5A

Observations of Stratified Flow Past Three-Dimensional Barriers,
W80-03624 8B

Infiltration of Soils as Affected by the Pressure and Water Content at the Time of Compaction,
W80-03722 2G

Air Bubbles in a Convectively Accelerated Water Flow,
W80-03740 8B

The Nutritional Ecology of Cyperus Esculentus, an Emergent Aquatic Plant, Grown on Different Sediments,
W80-03786 2I

The Microdistribution of Epiphytes on the Leaves of Natural and Artificial Macrophytes,
W80-03798 5C

LAGOON
Langebaan Lagoon: A Mixed Carbonate-Siliciclastic Tidal Environment in a Semi-Arid Climate,
W80-03865 2J

LAKE BISTINEAU (LA)
Effects of Mechanical Cutting on Submersed Vegetation in a Louisiana Lake,
W80-03832 4A

LAKE CHILWA
Zooplankton in a Quasi-Stable Phase in an Endorheic Lake (Lake Chilwa, Malawi),
W80-03807 5C

LAKE EKOLN
An Empirical Model for Physical Parameters of Recent Sedimentary Deposits of Lake Ekoln and Lake Vanern,
W80-03790 5A

LAKE ELEVATIONS
Water Resources Data for Florida, Water Year 1978--Volume 3A-1. Southwest Florida Surface Water.
W80-03754 7C

LAKE ERIE
Organochlorine Insecticides and PCBs in Sediments of Lake St. Clair (1970 and 1974) and Lake Erie (1971),
W80-03894 5C

LAKE GREVELINGEN
Consumption of Eelgrass, Zostera Marina, by Birds and Invertebrates During the Growing Season in Lake Grevelingen (SW Netherlands),
W80-03819 5C

LAKE MENDOTA (WI)
Anerobic Metabolism of Immediate Methane Precursors in Lake Mendota,
W80-03812 5C

Sterols in Natural Water and Sediment,
W80-03900 5C

LAKE MICHIGAN
Trace Element Loading of Southern Lake Michigan by Dry Deposition of Atmospheric Aerosol,
W80-03621 5B

LAKE ONTARIO
Distribution of Bacteria and Chlorophyll A at a Nearshore Station in Lake Ontario,
W80-03822 5C

LAKE ST. CLAIRE
Organochlorine Insecticides and PCBs in Sediments of Lake St. Clair (1970 and 1974) and Lake Erie (1971),
W80-03894 5C

LAKE STAGES
Diatom Floristics and Succession in a Peat Bog Near Lily Lake, Summit County, Utah,
W80-03872 2H

LAKE SUPERIOR
Copper Mining from Under Lake Superior: The Legal Aspects,
W80-03759 6E

LAKE VANERN
An Empirical Model for Physical Parameters of Recent Sedimentary Deposits of Lake Ekoln and Lake Vanern,
W80-03790 5A

LAKE WINGRA (WI)
Sterols in Natural Water and Sediment,
W80-03900 5C

LAKES
Formulating Lake Models Which Preserve Spectral Statistics,
W80-03605 2H

Fish Mortality and Fishing During an Unprecedented Draught in Lake Pichhola, Udaipur,
W80-03698 2H

Surface-Water Features in Osceola County and Adjacent Areas, Florida,
W80-03761 7C

Verifying Lake Transport Models with Special Statistics,
W80-03836 2H

LAND CLEARING
Methods of Estimating Some Possible Interactions of Agricultural Development and Water Resources in Alaska,
W80-03711 2A

LAND SUBSIDENCE
Geophysical and Hydrologic Prediction of Fissuring and Land Subsidence, South-Central Arizona,
W80-03710 6A

LANDSLIDES
Submarine Slide-Generated Water Waves in Kitimat Inlet, British Columbia,
W80-03627 2L

LAWNS
Measuring Evapotranspiration of Turfgrass,
W80-03646 2D

LEACHING
Reclamation of Saline-Sodic Soils by Leaching,
W80-03723 2G

LEAD
Contributions of Urban Land Use to Stream Water Quality,
W80-03644 5B

The Field Assessment of Effects of Dumping Wastes at Sea: 3. A Survey of the Sewage Sludge Disposal Area in Lyme Bay,
W80-03696 5A

LEAD RADIOISOTOPES
Extraction and Accumulation of 210Pb by Aquatic Organisms in Lakes,
W80-03677 5B

LEADERSHIP
Environmental Protection for Whom,
W80-03853 6B

LEGAL ASPECTS
The Economic Consequences of Allocating Groundwater to Competing Interest in the Santa Cruz Basin, Pima County, Arizona,
W80-03707 6E

LEGISLATION
Environmental Quality and Economic Development,
W80-03857 6E

An Overview of Offshore Environmental Pollution Laws and Regulations in Canada, Greenland, and the North Sea,
W80-03896 5C

LIGHT
Phytoplankton Distribution and Light Attenuation in Port Hacking Estuary,
W80-03799 5C

Attenuation of Light and Daily Integral Rates of Photosynthesis Attained by Planktonic Algae,
W80-03837 2H

LIGHT INTENSITY
Light Stimulation of Phosphate Uptake in Natural Assemblages of Phytoplankton,
W80-03821 5C

LIMITING FACTORS
Anerobic Metabolism of Immediate Methane Precursors in Lake Mendota,
W80-03812 5C

LIQUID WASTES
Sources and Characteristics of Liquid Process Wastes from Arctic Offshore Hydrocarbon Exploration,
W80-03898 5C

LITTLE LAKE BARTON (FL)
Biological Control of Hydrilla Verticillata Royle with Grass Carp (Ctenopharyngodon Idella Val),
W80-03830 4A

LOCH LEVEN
A Nine-Year Study of the Phytoplankton of the Eutrophic and Non-Stratifying Loch Leven (Kinross, Scotland),
W80-03816 5C

LODI (NJ)
The Influence of Urbanization of the Transport of Heavy Metals in New Jersey Streams,
W80-03774 5B

LONG-TERM PLANNING
Residuals Management: A Tool in River-Quality Assessment Applied to Coal Development in the Yampa River Basin, Colorado,
W80-03616 6B

Impacts of the Western Drought on the Regional Electricity Situation.
W80-03843 6D

LOOSE BOULDERS
Hydraulics of a Large Channel Paved with Boulders,
W80-03741 2E

LOUISIANA
Establishment of Waterhyacinth Weevil Populations in Louisiana,
W80-03829 4A

LOW FLOW
Low-Flow Characteristics of Streams in the Pecatonica-Sugar River Basin, Wisconsin,
W80-03765 2E

LOW-FLOW FREQUENCY
Low-Flow Characteristics of Streams in the Pecatonica-Sugar River Basin, Wisconsin,
W80-03765 2E

MACROPHYTES
Seasonal Variations in Net Photosynthetic Performance and Cover of Intertidal Macrophytes,
W80-03660 5C

MAINE
Phosphrus Export from Rural Maine Watersheds,
W80-03776 5B

MALAYSIA
The Ecology of Sandy Beaches in Penang, Malaysia, with Special Reference to Excirolana Orientalis (Dana),
W80-03633 2L

Employment in the Fishing Industry: Some Preliminary Findings on Fishermen's Mobility,
W80-03856 6F

MANGANESE
Behaviour of Manganese in the Rhine and Scheldt Estuaries, II. Geochemical Cycling,
W80-03630 2L

Manganese Removal from Water by Flotation with Microgas Dispersions,
W80-03748 5F

MANGANESE REMOVAL
Manganese Removal from Water by Flotation with Microgas Dispersions,
W80-03748 5F

MANGROVE SWAMPS
Distribution of Macrofauna on a Malayan Mangrove Shore,
W80-03870 2I

Structure of Mangrove Forests in Florida, Puerto Rico, Mexico, and Costa Rica,
W80-03879 2I

MAPS
Places in Connecticut Where Ground Water is Known to Have Deteriorated in Quality,
W80-03762 7C

MARINE ALGAE
The Effects of Bottle Volume, Thallus Weight, Oxygen Saturation Levels, and Water Movement on Apparent Photosynthetic Rates in Marine Algae,
W80-03659 5C

Seasonal Variations in Net Photosynthetic Performance and Cover of Intertidal Macrophytes,
W80-03660 5C

The Distribution of Algal Epiphytes on Macrophyte Hosts Offshore from La Parguera, Puerto Rico,
W80-03797 5C

Two Phases of the Phytoplankton Community in the Baja California Upwelling,
W80-03805 5C

MARINE ANIMALS
Mobilization of Organochlorines from Female Lipid Tissue and Transplacental Transfer to Fetus in a Harbour Porpoise (Phocoena Phocoena) in a Contaminated Area,
W80-03687 5B

MARINE FISHERIES
Marine Resources Committee-Annual Review of Significant Legislative, Judicial and Administrative Activities During 1977.
W80-03889 6E

MARINE MAMMALS
Mobilization of Organochlorines from Female Lipid Tissue and Transplacental Transfer to Fetus in a Harbour Porpoise (Phocoena Phocoena) in a Contaminated Area,
W80-03687 5B

MARINE PLANTS
Chemical Fluctuations Due to Seasonal and Cropping Effects on an Algal-Seagrass Community,
W80-03785 2I

MARSH PLANTS
Seasonal Occurrence and Variation in Standing Crop of a Drift Algal Community in the Indian River, Florida,
W80-03803 5C

Photosynthetically Active Radiation in a Stand of Phragmites Communis Trin. II. Model of Light Extinction in the Stand,
W80-03869 2H

Phytosociological Studies of Uryu-Numa Mire Studies of Upland Bog Vegetation in Hokkaido (II), (In Japanese),
W80-03874 2I

Comparison of the Assemblages of Sap-Feeding Insects (Homoptera-Hemiptera) Inhabiting Two Structurally Different Salt Marsh Grasses in the Genus Spartina,
W80-03881 2I

Pattern and Diversity in Swamp and Dune Vegetation, North Stradbroke Island,
W80-03882 2I

MARSHES
Optimal Niche Space of the Redwinged Blackbird (Agelaius Phoeniceus), I. Nesting Success in Marsh and Upland Habitat,
W80-03875 2I

MATHEMATICAL MODELS
Formulating Lake Models Which Preserve Spectral Statistics,
W80-03605 2H

Dissolved Oxygen and Biochemical Oxygen Demand,
W80-03612 5A

Optimization of Unit Hydrograph Determination,
W80-03617 2E

An Analysis of the Irreversible Thermodynamics Model for Coupled Heat and Moisture Transport Phenomena in Unsaturated Porous Media,
W80-03639 1A

Level III: Receiving Water Quality Modeling for Urban Stormwater Management,
W80-03657 5D

The Influence of Adsorption on the Rates of Microbial Degradation of Arsenic Species in Sediments,
W80-03692 5B

A Hysteresis Model Based on an Explicit Domain-Dependence Function,
W80-03720 2G

Air Bubbles in a Convectively Accelerated Water Flow,
W80-03740 8B

Flow in the Sea of Heavy Metals from a Smelter Industry,

A Parametric Model Calibrated with a Physically Based Model for Runoff Prediction from Ungaged Streams,
W80-03839 2E

A Bioeconomic Model of the Gulf of Mexico Shrimp Fishery,
W80-03845 8I

Photosynthetically Active Radiation in a Stand of Phragmites Communis Trin. II. Model of Light Extinction in the Stand,
W80-03869 2H

MOLECULAR STRUCTURE
Effect of Benzoate on Microbial Decomposition of Fulvic Acids in Tjeukemeer (The Netherlands),
W80-03893 2K

MOLLUSKS
Copper Toxicity to the Bay Scallop (Argopecten Irradians),
W80-03689 5C

MONITORING
Toward a Conceptual Framework for River-Quality Trend and Cause-Effect Analysis,
W80-03611 5B

A Periphyton Growth Substrate Useful for Nutrient Impact Studies in Large Rivers,
W80-03665 5A

Instrumentation of Urban Hydrology Monitoring Sites in Southeast Florida,
W80-03766 7B

MONSOONS
Does Precipitation Pattern Foretell Gujarat Climate Becoming Arid,
W80-03638 2B

MONTANA
Structural Controls of Hot-Spring Systems in Southwestern Montana,
W80-03760 1A

MOSQUITOES
Transfer of 14C-Toluene from Mosquito Larvae to Bluegill Sunfish,
W80-03686 5B

Behavior of Abate in Microorganisms Isolated from Polluted Water,
W80-03892 5F

MOUNTAINS
Hydraulic Conductivity of Mountain Soils,
W80-03775 2C

Interim Progress Report Supplement a -- Data Analysis, SCPP Data Collection and Analysis for the Period 1 January 1979 Through 30 June 1979,
W80-03779 3B

MOVEMENT
The Effects of Bottle Volume, Thallus Weight, Oxygen Saturation Levels, and Water Movement on Apparent Photosynthetic Rates in Marine Algae,
W80-03659 5C

MULTINATIONAL CORPORATIONS
Multinational Corporations, Nation-States and Ocean Resource Management: The Impact of the World's 200-Mile Economic Zone on Multinational and National Development,
W80-03859 6E

MUTAGENS
Mutagenicity of Fluorene Derivatives: A Proposed Mechanism,
W80-03745 5A

Mutagens in a River Heavily Polluted with Paper Recycling Wastes: Results of Field and Laboratory Mutagen Assays,
W80-03746 5A

NAPHTHALENES
Identification of Organic Sulfur Compounds Transferred to Fish from Petroleum Suspension by Mass Chromatography,
W80-03671 5B

NATURAL RECHARGE
Paul Spring: An Investigation of Recharge in the Roswell (NM) Artesian Basin,
W80-03642 2F

NATURAL RESOURCES
Adaptive Economics and Natural Resources Policy,
W80-03854 6B

NESTING
Optimal Niche Space of the Redwinged Blackbird (Agelaius Phoeniceus), I. Nesting Success in Marsh and Upland Habitat,
W80-03875 2I

NEW YORK
A Nutritional Analysis of a Sublittoral Diatom Assemblage Epiphytic on Enteromorpha from a Long Island Salt Marsh,
W80-03862 2I

NEW YORK BIGHT
Particle Reworking in Sediments from the New York Bight Apex: Evidence from 234Th/238U Disequilibrium,
W80-03629 2J

NEW ZEALAND
Organochlorine, Fluorine, and Heavy-Metal Levels in Some Birds from New Zealand Estuaries,
W80-03691 5B

NICKEL
The Field Assessment of Effects of Dumping Wastes at Sea: 3. A Survey of the Sewage Sludge Disposal Area in Lyme Bay,
W80-03696 5A

NITRATES
Incidents of Elevated Nitrate in Southern Ontario,
W80-03623 5B

Nitrate and Phytoplankton Production in Southern California Coastal Waters,
W80-03789 5C

NITROGEN
Early Growth of Picea Sitchensis (Bong.) Carr on Deep Oligotrophic Peat in Northern Ireland,
W80-03863 2I

NITROGEN FIXATION
Nitrogen Fixation by Thermophilic Blue-Green Algae (Cyanobacteria): Temperature Characteristics and Potential Use in Biophotolysis,
W80-03796 5F

NITROGEN FIXING BACTERIA
Nitrogen Fixation by Thermophilic Blue-Green Algae (Cyanobacteria): Temperature Characteristics and Potential Use in Biophotolysis,
W80-03796 5F

NOBLE GASES
Mixing Models and Ionic Geothermometers Applied to Warm (Up to 60C) Springs: Jordan Rift Valley, Israel,
W80-03728 2K

NON-GAME BIRDS
Optimal Niche Space of the Redwinged Blackbird (Agelaius Phoeniceus), I. Nesting Success in Marsh and Upland Habitat,
W80-03875 2I

NONPOINT POLLUTION
Determinants of Water Quality in Agricultural Watersheds,
W80-03709 5G

NORTH CAROLINA
Guidelines for Socioeconomic Impact Analyses of Environmental Regulations,
W80-03602 6C

A Technique for Estimating Heights Reached by the 100-Year Flood on Unregulated, Nontidal Streams in North Carolina,
W80-03764 2E

NORTH DAKOTA
Ground-Water Resources of Grant and Sioux Counties, North Dakota,
W80-03767 2F

NORTH SEA COAST
Behaviour of Manganese in the Rhine and Scheldt Estuaries, II. Geochemical Cycling,
W80-03630 2L

NORTHWESTERN PENNSYLVANIA
Selected Water Resources Data, Clarion River and Red-Bank Creek Basins, Northwestern Pennsylvania--Part 2,
W80-03770 7C

NOXFISH (TRADE NAME)
Rotenone Resistance of Golden Shiners from a Periodically Reclaimed Pond,
W80-03702 5A

NUCLEAR POWERPLANTS
Macroinfaunal Structure and Effects of Thermal Discharges in a Mesohaline Habitat of Chesapeake Bay, Near a Nuclear Power Plant,
W80-03672 5C

NUTRIENT FLUX MODELS
Temperature Effects on Steady-State Growth, Phosphorus Uptake, and the Chemical Composition of a Marine Phytoplankter,
W80-03804 5C

NUTRIENT LOADING
Prediction of the Quality of Water in a Proposed Impoundment in Southwestern Wisconsin, USA,
W80-03801 5B

NUTRIENT REMOVAL
The Use of Multiple Inversion and Clean-Flo Lake Cleanser in Controlling Aquatic Plants,
W80-03828 4A

NUTRIENT REQUIREMENTS
Temperature Effects on Steady-State Growth, Phosphorus Uptake, and the Chemical Composition of a Marine Phytoplankter,
W80-03804 5C

Light Stimulation of Phosphate Uptake in Natural Assemblages of Phytoplankton,
W80-03821 5C

A Nutritional Analysis of a Sublittoral Diatom Assemblage Epiphytic on Enteromorpha from a Long Island Salt Marsh,
W80-03862 2I

NUTRIENTS
Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-Iri Bay of Lake Kasumigaura, Japan, II Role of Waterchestnut in Primary Productivity and Nutrient Uptake,
W80-03681 5B

The Nutritional Ecology of Cyperus Esculentus, an Emergent Aquatic Plant, Grown on Different Sediments,
W80-03786 2I

Factors Affecting Tissue Nutrient Concentrations in a Scirpus-Equisetum Wetland,
W80-03876 2I

OCEANOGRAPHY
Some Aspects of the Oceanography of the Gulf of Mexico Using Satellite and in Situ Data,
W80-03628 2L

OCEANS
The Islay Front: Physical Structure and Phytoplankton Distribution,
W80-03733 2L

Multinational Corporations, Nation-States and Ocean Resource Management: The Impact of the World's 200-Mile Economic Zone on Multinational and National Development,
W80-03859 6E

OIL POLLUTION
Method for Removing Suspended Oil Droplets from Water,
W80-03647 5D

Liability for Oil Pollution - United States Law,
W80-03667 6E

Identification of Organic Sulfur Compounds Transferred to Fish from Petroleum Suspension by Mass Chromatography,
W80-03671 5B

Effects of Oil on Marine Phytoplankton Communities,
W80-03895 5C

An Overview of Offshore Environmental Pollution Laws and Regulations in Canada, Greenland, and the North Sea,
W80-03896 5C

Incorporation, Distribution and Fate of Saturated Petroleum Hydrocarbons in Sediments from a Controlled Marine Ecosystem,
W80-03899 5C

OIL SPILLS
Liability for Oil Pollution - United States Law,
W80-03667 6E

OKANAGON VALLEY
British Columbia Aquatic Plant Management Program,
W80-03840 4A

ON-SITE DATA COLLECTIONS
Application of in Situ Cage Cultures of Phytoplankton for Monitoring Heavy Metal Pollution in Two Norwegian Fjords,
W80-03800 5C

ON-SITE INVESTIGATIONS
River-Quality Assessments.
W80-03606 5B

An Interim Report on the Intensive River-Quality Assessment of the Upper Chattahoochee River Basin, Georgia,
W80-03609 5B

Hydraulics of Flow in the Kaskaskia River, Illinois,
W80-03713 2E

ONTARIO
Incidents of Elevated Nitrate in Southern Ontario,
W80-03623 5B

Characteristics of Effluents from Gray and Black Water Septic Tanks,
W80-03791 5B

OPEN CHANNEL FLOW
Hydraulics of a Large Channel Paved with Boulders,
W80-03741 2E

OPEN CHANNELS
Hydraulics of a Large Channel Paved with Boulders,
W80-03741 2E

OPTIMIZATION
Optimization of Unit Hydrograph Determination,
W80-03617 2E

Pigovian Taxes, Polluter Subsidies, Regulation, and the Size of a Polluting Industry,
W80-03848 6E

The Analysis of Risk in Irrigation Projects in Developing Countries,
W80-03851 6B

ORANGE LAKE (FL)
Mechanical Hydrilla Control in Orange Lake, Florida,
W80-03833 4A

OREGON
River-Quality Assessments.
W80-03606 5B

River-Quality Assessment: Concept, Framework, and Application in the Willamette River Basin, Oregon,
W80-03608 6B

Erosion Potential Assessment for the Willamette River Basin, Oregon,
W80-03613 7C

Algal Growth Potential--Lower Willamette River, Oregon,
W80-03614 5B

Surf Zone Dynamics During Upwelling on the Oregon Coast,
W80-03632 2L

ORGANIC COMPOUNDS
The Effects of the Anaesthetic Quinaldine on Oxygen Consumption in an Intertidal Teleost Blennius Pholis (L.),
W80-03690 5A

Distribution of Bacteria and Chlorophyll A at a Nearshore Station in Lake Ontario,
W80-03822 5C

Sterols in Natural Water and Sediment,
W80-03900 5C

ORGANIC LOADING
A Nine-Year Study of the Phytoplankton of the Eutrophic and Non-Stratifying Loch Leven (Kinross, Scotland),
W80-03816 5C

ORGANIC SOILS
Hydrologic Role of Shallow Organic Soils in Cold Climates,
W80-03649 2G

OSCEOLA COUNTY (FLA)
Surface-Water Features in Osceola County and Adjacent Areas, Florida,
W80-03761 7C

OSCILLATORY FLOW
Measurements of Combined Oscillatory and Steady Flow Over a Rough Bed,
W80-03620 8B

OUTER CONTINENTAL SHELF
Effects of Oil on Marine Phytoplankton Communities,
W80-03895 5C

An Overview of Offshore Environmental Pollution Laws and Regulations in Canada, Greenland, and the North Sea,
W80-03896 5C

The Transfer of Cadmium from Marine Heterotrophic Bacteria to Macoma Balthica,
W80-03897 5C

Sources and Characteristics of Liquid Process Wastes from Arctic Offshore Hydrocarbon Exploration,
W80-03898 5C

Incorporation, Distribution and Fate of Saturated Petroleum Hydrocarbons in Sediments from a Controlled Marine Ecosystem,
W80-03899 5C

OVERFLOW
Combined Sewer Overflow Treatment by Screening and Terminal Ponding -- Fort Wayne, Indiana,
W80-03656 5D

OXYGEN REQUIREMENTS
The Effects of the Anaesthetic Quinaldine on Oxygen Consumption in an Intertidal Teleost Blennius Pholis (L.),
W80-03690 5A

OYSTERS
Dependence of the Time of Gamete Maturation and Spawning on Environmental Temperature in the Virginia Oyster Crassostrea Virginica,
W80-03679 5C

OZONE
Comparison of Ozone Contactors for Municipal Wastewater Effluent Disinfection -- Packed Column Versus Jet Scrubber,
W80-03653 5D

Effect of Particulates on Ozone Disinfection of Bacteria and Viruses in Water,
W80-03654 5F

PACIFIC NORTHWEST U.S.
Impacts of the Western Drought on the Regional Electricity Situation.
W80-03843 6D

PAPER RECYCLING
Mutagens in a River Heavily Polluted with Paper Recycling Wastes: Results of Field and Laboratory Mutagen Assays,
W80-03746 5A

PARATHION
An Artificial Microbial Ecosystem for Determining Effects and Fate of Toxicants in a Salt-Marsh Environment,
W80-03670 5A

Pesticides and Aquatic Ecosystems,
W80-03699 5C

PATENTS
Flow Control Devices Particularly Useful for Drip Irrigation,
W80-03604 3F

Nitrification-Denitrification of Wastewater,
W80-03610 5D

Method for Removing Suspended Oil Droplets from Water,
W80-03647 5D

PATH OF POLLUTANTS
On the Value of Soil Columns for Assessing the Transport Pattern of Viruses Through Soils: A Critical Outlook,
W80-03622 5B

Incidents of Elevated Nitrate in Southern Ontario,
W80-03623 5B

Contributions of Urban Land Use to Stream Water Quality,
W80-03644 5B

Transfer of 14C-Toluene from Mosquito Larvae to Bluegill Sunfish,
W80-03686 5B

Geology and Geochemistry of Arsenic, Ester Dome Area, Alaska,
W80-03712 2K

PEAK DISCHARGE
A Technique for Estimating Heights Reached by the 100-Year Flood on Unregulated, Nontidal Streams in North Carolina,
W80-03764 2E

PEAT
Early Growth of Picea Sitchensis (Bong.) Carr on Deep Oligotrophic Peat in Northern Ireland,
W80-03863 2I

PECATONICA-SUGAR RIVER BASIN (WIS)
Low-Flow Characteristics of Streams in the Pecatonica-Sugar River Basin, Wisconsin,
W80-03765 2E

PENANG (MALAYSIA)
The Ecology of Sandy Beaches in Penang, Malaysia, with Special Reference to Excirolana Orientalis (Dana),
W80-03633 2L

PENNSYLVANIA
Selected Water Resources Data, Clarion River and Red-Bank Creek Basins, Northwestern Pennsylvania--Part 2,
W80-03770 7C

PEPTONE
The Effect of Phosphate and Temperature on Growth of Activated Sludge and on Biodegradation of Surfactants,
W80-03793 5D

PERIPHYTON
A Periphyton Growth Substrate Useful for Nutrient Impact Studies in Large Rivers,
W80-03665 5A

PERMAFROST
Hydrologic Role of Shallow Organic Soils in Cold Climates,
W80-03649 2G

Snowmelt Infiltration Into Seasonally Frozen Soils,
W80-03650 2G

PERMEABILITY
Geohydrologic Model of the Floridan Aquifer in the Southwest Florida Water Management District,
W80-03751 2F

PESTICIDE KINETICS
Mobilization of Organochlorines from Female Lipid Tissue and Transplacental Transfer to Fetus in a Harbour Porpoise (Phocoena Phocoena) in a Contaminated Area,
W80-03687 5B

PESTICIDE RESIDUES
Mobilization of Organochlorines from Female Lipid Tissue and Transplacental Transfer to Fetus in a Harbour Porpoise (Phocoena Phocoena) in a Contaminated Area,
W80-03687 5B

Organochlorine, Fluorine, and Heavy-Metal Levels in Some Birds from New Zealand Estuaries,
W80-03691 5B

PESTICIDE TOXICITY
The Reaction of Phragmites Communis Roots to DDT and Hexachlorane,
W80-03661 5C

Pesticides and Aquatic Ecosystems,
W80-03699 5C

Dynamics and Behavioral Toxicology of Aqua-Kleen (Trade Name) (2,4-D Butoxyethanol Ester) as Revealed by the Modification of Rheotropism in Rainbow Trout,
W80-03703 5A

Behavior of Abate in Microorganisms Isolated from Polluted Water,
W80-03892 5F

PESTICIDES
Adsorption-Desorption of Diuron by Freshwater Sediments,
W80-03838 5B

PHAEOPHYTA
Experimental Ecology with Particular Reference to Proposed Commercial Harvesting of Durvillaea (Phaeophyta, Durvilleales) in New Zealand,
W80-03802 2I

PHENOLS
Effect of Some Chemical Agents on the Uptake of 32p and 65Zn by Macrophytes in the Black Sea,
W80-03662 5B

PHOSPHAMIDON
Pesticides and Aquatic Ecosystems,
W80-03699 5C

PHOSPHATES
The Release of Reactive Phosphate by a Posidonia Australis Seagrass Community,
W80-03808 2A

Light Stimulation of Phosphate Uptake in Natural Assemblages of Phytoplankton,
W80-03821 5C

PHOSPHORUS
Effect of Some Chemical Agents on the Uptake of 32p and 65Zn by Macrophytes in the Black Sea,
W80-03662 5B

Phosphrus Export from Rural Maine Watersheds,
W80-03776 5B

The Effect of Phosphate and Temperature on Growth of Activated Sludge and on Biodegradation of Surfactants,
W80-03793 5D

Prediction of the Quality of Water in a Proposed Impoundment in Southwestern Wisconsin, USA,
W80-03801 5B

Temperature Effects on Steady-State Growth, Phosphorus Uptake, and the Chemical Composition of a Marine Phytoplankter,
W80-03804 5C

PHOTOSYNTHESIS
The Effects of Bottle Volume, Thallus Weight, Oxygen Saturation Levels, and Water Movement on Apparent Photosynthetic Rates in Marine Algae,
W80-03659 5C

Seasonal Variations in Net Photosynthetic Performance and Cover of Intertidal Macrophytes,
W80-03660 5C

Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-Iri Bay of Lake Kasumigaura, Japan, II Role of Waterchestnut in Primary Productivity and Nutrient Uptake,
W80-03681 5B

Photosynthesis in the Aquatic Macrophyte Egeria Densa. III Gas Exchange Studies,
W80-03806 5C

Attenuation of Light and Daily Integral Rates of Photosynthesis Attained by Planktonic Algae,
W80-03837 2H

PHYSICAL PROPERTIES
The Islay Front: Physical Structure and Phytoplankton Distribution,
W80-03733 2L

PHYSICOCHEMICAL PROPERTIES
Composition and Abundance of Phytoplankton in Tributaries of the Lower Colorado River, Grand Canyon Region,
W80-03890 5C

PHYTOPLANKTON
The Effect of the Degree of Mineralization of Water on Phytoplankton,
W80-03664 5A

Mercury Circulation in Aquatic Environment. Part 2: Metabolism of Methyl and Phenyl Mercury in Phytoplankton,
W80-03682 5B

Evaluation of Saprobicity of the Volgograd Reservoir in Terms of the Phytoplankton,
W80-03694 5C

The Islay Front: Physical Structure and Phytoplankton Distribution,
W80-03733 2L

The Effects of Vertical Stability on Phytoplankton Distributions in the Summer on the Northwest European Shelf,
W80-03784 5C

Nitrate and Phytoplankton Production in Southern California Coastal Waters,
W80-03789 5C

Phytoplankton Distribution and Light Attenuation in Port Hacking Estuary,
W80-03799 5C

Two Phases of the Phytoplankton Community in the Baja California Upwelling,
W80-03805 5C

Influence of the Shelf-Break Front off Nova Scotia on Phytoplankton Standing Stock in Winter,
W80-03809 5C

A Nine-Year Study of the Phytoplankton of the Eutrophic and Non-Stratifying Loch Leven (Kinross, Scotland),
W80-03816 5C

Light Stimulation of Phosphate Uptake in Natural Assemblages of Phytoplankton,
W80-03821 5C

Seasonal Succession of Phytoplankton in a Large Subarctic River,
W80-03824 5C

Composition and Abundance of Phytoplankton in Tributaries of the Lower Colorado River, Grand Canyon Region,
W80-03890 5C

Effects of Oil on Marine Phytoplankton Communities,
W80-03895 5C

PIEDMONT
A Technique for Estimating Heights Reached by the 100-Year Flood on Unregulated, Nontidal Streams in North Carolina,
W80-03764 2E

PILOT PLANTS
Design of an Indirect Freezing Process Pilot Plant Based on Bulk Crystallization,
W80-03772 3A

PLANKTON
Attenuation of Light and Daily Integral Rates of Photosynthesis Attained by Planktonic Algae,
W80-03837 2H

PLANNING
Standards, Optimality and Resilience in Water-Resource Management,
W80-03750 6A

PLANT GROWTH
Phytomechanics--Plant Physiology and Applied Mechanics,
W80-03780 2I

Chemical Fluctuations Due to Seasonal and Cropping Effects on an Algal-Seagrass Community,
W80-03785 2I

Experimental Ecology with Particular Reference to Proposed Commercial Harvesting of Durvillaea (Phaeophyta, Durvilleales) in New Zealand,
W80-03802 2I

Early Growth of Picea Sitchensis (Bong.) Carr on Deep Oligotrophic Peat in Northern Ireland,
W80-03863 2I

Comparative Biomass and Growth of Cypress in Florida Wetlands,
W80-03866 2I

PLANT GROWTH REGULATORS
Establishment of Waterhyacinth Weevil Populations in Louisiana,
W80-03829 4A

PLANT MORPHOLOGY
Structure of Mangrove Forests in Florida, Puerto Rico, Mexico, and Costa Rica,
W80-03879 2I

PLANT PHYSIOLOGY
Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-Iri Bay of Lake Kasumigaura, Japan, II Role of Waterchestnut in Primary Productivity and Nutrient Uptake,
W80-03681 5B

Phytomechanics--Plant Physiology and Applied Mechanics,
W80-03780 2I

Seasonal Variation in the Biomass, Tuber Density, and Photosynthetic Metabolism of Hydrilla in Three Florida Lakes,
W80-03834 5C

PLANT TISSUES
Taxonomic Characteristics of Aquatic Plants from the Alimentary Tract of Grass Carp,
W80-03831 4A

PLECOGLOSSUS
Chemotherapeutical Studies on Trimethoprim Against Vibriosis of Pond-Cultured Ayu--II. Tissue Levels After Administration of Trimethoprim-Sulfadoxine Mixture (In Japanese),
W80-03693 5B

POLICY
What Can We Get From Effluent Charges,
W80-03849 6B

Financial Statement Modeling: Analyzing the Pollution-Control Tax Incentive,
W80-03850 6B

POLITICAL ASPECTS
Estimating Willingness to Pay: Why and How.,
W80-03846 6B

Canadian-American Relations in the Arctic: The Effect of Environmental Influences Upon Territorial Claims,
W80-03852 6E

Environmental Protection for Whom,

POLLUTANT IDENTIFICATION
Identification of Organic Sulfur Compounds Transferred to Fish from Petroleum Suspension by Mass Chromatography,
W80-03671 5B

POLLUTANTS
Environmental Management in General Equilibrium: A New Incentive Compatible Approach,
W80-03855 6B

POLLUTION ABATEMENT
Environmental Protection for Whom,
W80-03853 6B

POLLUTION CONTROLS
Formulating Lake Models Which Preserve Spectral Statistics,
W80-03605 2H

POLLUTION TAXES (CHARGES)
Pigovian Taxes, Polluter Subsidies, Regulation, and the Size of a Polluting Industry,
W80-03848 6E

What Can We Get From Effluent Charges,
W80-03849 6B

Financial Statement Modeling: Analyzing the Pollution-Control Tax Incentive,
W80-03850 6B

POLYCHAETES
Macroinfaunal Structure and Effects of Thermal Discharges in a Mesohaline Habitat of Chesapeake Bay, Near a Nuclear Power Plant,
W80-03672 5C

PONDING
Combined Sewer Overflow Treatment by Screening and Terminal Ponding -- Fort Wayne, Indiana,
W80-03656 5D

POPULATION DYNAMICS
Zooplankton in a Quasi-Stable Phase in an Endorheic Lake (Lake Chilwa, Malawi),
W80-03807 5C

Influence of the Shelf-Break Front off Nova Scotia on Phytoplankton Standing Stock in Winter,
W80-03809 5C

Seasonal Changes of Bacterioplankton in a Reservoir Related to Algae. I. Numbers and Biomass,
W80-03811 5C

Seasonal Succession of Phytoplankton in a Large Subarctic River,
W80-03824 5C

PORE PRESSURE
A Hysteresis Model Based on an Explicit Domain-Dependence Function,
W80-03720 2G

PORE WATER
A Hysteresis Model Based on an Explicit Domain-Dependence Function,
W80-03720 2G

POROSITY
Geohydrologic Model of the Floridan Aquifer in the Southwest Florida Water Management District,
W80-03751 2F

POROUS MEDIA
Preparation of Friable Aquiferous Specimens,
W80-03719 8E

PORPOISE
Mobilization of Organochlorines from Female Lipid Tissue and Transplacental Transfer to Fetus in a Harbour Porpoise (Phocoena Phocoena) in a Contaminated Area,
W80-03687 5B

PORT HACKING
The Release of Reactive Phosphate by a Posidonia Australis Seagrass Community,
W80-03808 2A

PORTUGAL
Ocean Tide Effect Study on a Coastal Carbonate Aquifer (Miocene of Algarve, Portugal) ((Etude De L'Effet De Maree Oceanique Sur Un Aquifere Carbonate Cotier (Miocene De L'Algarve--Portugal)),
W80-03731 2F

POTABLE WATER
Seasonal Changes of Bacterioplankton in a Reservoir Related to Algae. I. Numbers and Biomass,
W80-03811 5C

POULTRY
Algae Grown on Wastewater as a Source of Protein for Young Chickens and Rats,
W80-03817 3C

Secondary Toxicology and Contaminants of Algae Grown on Wastewater,
W80-03818 3C

PRECIPITATION (ATMOSPHORIC)
Interim Progress Report Supplement a -- Data Analysis, SCPP Data Collection and Analysis for the Period 1 January 1979 Through 30 June 1979,
W80-03779 3B

PREDATION
Effects of Dinoflagellate Bioluminescence on the Ingestion Rates of Herbivorous Zooplankton,
W80-03782 5C

Carnivorous Feeding Behavior of the Adult Calanoid Copepod Acartia Tonsa Dana,
W80-03783 5C

PRICES
Hedonic Prices, Property Values and Measuring Environmental Benefits: A Survey of the Issues,
W80-03847 6B

PRIMARY PRODUCTIVITY
Nitrate and Phytoplankton Production in Southern California Coastal Waters,
W80-03789 5C

PRINCIPAL COMPONENT ANALYSIS
Two Phases of the Phytoplankton Community in the Baja California Upwelling,
W80-03805 5C

PROBABILITY
Standards, Optimality and Resilience in Water-Resource Management,
W80-03750 6A

PRODUCTIVITY
Evaluation of Saprobicity of the Volgograd Reservoir in Terms of the Phytoplankton,
W80-03694 5C

Influence of the Shelf-Break Front off Nova Scotia on Phytoplankton Standing Stock in Winter,
W80-03809 5C

PROJECTS
Summary of U.S. Geological Survey Investigations and Hydrologic Conditions in the Southwest Florida Water Management District for 1978,
W80-03771 7C

PROPERTY VALUES
Hedonic Prices, Property Values and Measuring Environmental Benefits: A Survey of the Issues,
W80-03847 6B

PROTEINS
Algae Grown on Wastewater as a Source of Protein for Young Chickens and Rats,
W80-03817 3C

PSYCHOLOGICAL ASPECTS
Environmental Protection for Whom,
W80-03853 6B

PUBLIC HEALTH
Residential Water Reuse,
W80-03640 3D

Pesticides and Aquatic Ecosystems,
W80-03699 5C

PUBLICATIONS
Summary of U.S. Geological Survey Investigations and Hydrologic Conditions in the Southwest Florida Water Management District for 1978,
W80-03771 7C

PULP AND PAPER INDUSTRY
Mutagens in a River Heavily Polluted with Paper Recycling Wastes: Results of Field and Laboratory Mutagen Assays,
W80-03746 5A

QUINALDINE
The Effects of the Anaesthetic Quinaldine on Oxygen Consumption in an Intertidal Teleost Blennius Pholis (L.),
W80-03690 5A

RACINE (WIS)
Screening/Flotation Treatment of Combined Sewer Overflows, Volume II: Full-Scale Operation Racine, Wisconsin,
W80-03652 5D

RADIOISOTOPES
Particle Reworking in Sediments from the New York Bight Apex: Evidence from 234Th/238U Disequilibrium,
W80-03629 2J

RAIN
Effects of Artificial Acid Rain on Microbial Activity and Biomass,
W80-03688 5C

RAINBOW TROUT
Dynamics and Behavioral Toxicology of Aqua-Kleen (Trade Name) (2,4-D Butoxyethanol Ester) as Revealed by the Modification of Rheotropism in Rainbow Trout,
W80-03703 5A

RAINFALL
Optimization of Unit Hydrograph Determination,
W80-03617 2E

Forecasting Storm Rainfall Over Bhagirathi Catchment Due to Depressions/Cyclonic Storms,
W80-03635 2B

On the Assessment of Crop Droughts: A Case Study for Disa (Gujarat),

REGIONAL ECONOMICS
Chesapeake Bay Future Conditions Report. Appendix 3. Economic and Social Profile.
W80-03844 6B

REGULATION
Pigovian Taxes, Polluter Subsidies, Regulation, and the Size of a Polluting Industry,
W80-03848 6E

An Overview of Offshore Environmental Pollution Laws and Regulations in Canada, Greenland, and the North Sea,
W80-03896 5C

REGULATIONS
Guidelines for Socioeconomic Impact Analyses of Environmental Regulations,
W80-03602 6C

REMOTE SENSING
Some Aspects of the Oceanography of the Gulf of Mexico Using Satellite and in Situ Data,
W80-03628 2L

Interpretation of Unenhanced Landsat Imagery for Wetland and Land Use Delineation in the Texas Coastal Zone,
W80-03878 7C

RESEARCH EQUIPMENT
A Periphyton Growth Substrate Useful for Nutrient Impact Studies in Large Rivers,
W80-03665 5A

An Artificial Microbial Ecosystem for Determining Effects and Fate of Toxicants in a Salt-Marsh Environment,
W80-03670 5A

Application of in Situ Cage Cultures of Phytoplankton for Monitoring Heavy Metal Pollution in Two Norwegian Fjords,
W80-03800 5C

RESERVOIR OPERATION
The Anticipated Decision Influence Period in Real Time Reservoir Operation,
W80-03645 6A

RESERVOIR OPERATION MODEL
The Anticipated Decision Influence Period in Real Time Reservoir Operation,
W80-03645 6A

RESERVOIR RELEASE DECISIONS
The Anticipated Decision Influence Period in Real Time Reservoir Operation,
W80-03645 6A

RESERVOIR STORAGE
The Anticipated Decision Influence Period in Real Time Reservoir Operation,
W80-03645 6A

RESERVOIRS
Evaluation of Saprobicity of the Volgograd Reservoir in Terms of the Phytoplankton,
W80-03694 5C

RESISTANCE
Rotenone Resistance of Golden Shiners from a Periodically Reclaimed Pond,
W80-03702 5A

RESOURCE ALLOCATION
American Bar Association Resolution Re Natural Resources of the Sea Adopted by the House of Delegates, August 6, 1973 and Report of the Section of Natural Resources Law Recommending Adoption of the Resolution.
W80-03695 6E

RESOURCE MANAGEMENT
Environmental Management in General Equilibrium: A New Incentive Compatible Approach,
W80-03855 6B

RESOURCES DEVELOPMENT
Fishermen's Remuneration Systems and Implications for Fisheries Development,
W80-03858 6C

Multinational Corporations, Nation-States and Ocean Resource Management: The Impact of the World's 200-Mile Economic Zone on Multinational and National Development,
W80-03859 6E

REVERSE OSMOSIS
Low Pressure Brackish Water Reverse Osmosis Membrane Development - Final Report,
W80-03749 3A

RHEOTROPISM
Dynamics and Behavioral Toxicology of Aqua-Kleen (Trade Name) (2,4-D Butoxyethanol Ester) as Revealed by the Modification of Rheotropism in Rainbow Trout,
W80-03703 5A

RHINE ESTUARY
Behaviour of Manganese in the Rhine and Scheldt Estuaries, II. Geochemical Cycling,
W80-03630 2L

RILL DEVELOPMENT SIMULATION
Role of Rill Development in Salt Loading from Hillslopes,
W80-03643 2J

RIPARIAN PLANTS
Determinants of Water Quality in Agricultural Watersheds,
W80-03709 5G

RISKS
The Analysis of Risk in Irrigation Projects in Developing Countries,
W80-03851 6B

Fishermen's Remuneration Systems and Implications for Fisheries Development,
W80-03858 6C

RIVER BASINS
River-Quality Assessments.
W80-03606 5B

River-Quality Assessment--A Rational Scientific Basis for Pollution Control and Water-Quality Management,
W80-03607 5G

River-Quality Assessment: Concept, Framework, and Application in the Willamette River Basin, Oregon,
W80-03608 6B

An Interim Report on the Intensive River-Quality Assessment of the Upper Chattahoochee River Basin, Georgia,
W80-03609 5B

Erosion Potential Assessment for the Willamette River Basin, Oregon,
W80-03613 7C

Residuals Management: A Tool in River-Quality Assessment Applied to Coal Development in the Yampa River Basin, Colorado,
W80-03616 6B

Selected Water Resources Data, Clarion River and Red-Bank Creek Basins, Northwestern Pennsylvania--Part 2,
W80-03770 7C

RIVER FLOW
Hydraulics of Flow in the Kaskaskia River, Illinois,

Thermal Modeling of Highly Transient Flows in the Chattahoochee River Near Atlanta, Georgia,
W80-03615 2E

Turbulence Measurements in the Boundary Layer Over a Sand Wave Field,
W80-03626 2E

Behaviour of Manganese in the Rhine and Scheldt Estuaries, II. Geochemical Cycling,
W80-03630 2L

RODENTS
Algae Grown on Wastewater as a Source of Protein for Young Chickens and Rats,
W80-03817 3C

ROOT SYSTEMS
The Reaction of Phragmites Communis Roots to DDT and Hexachlorane,
W80-03661 5C

ROOTED AQUATIC PLANTS
The Absorption of DDT by Vascular Aquatic Plants,
W80-03663 5B

Taxonomic Notes on Epiphytic Diatoms of Mississippi Sound, U.S.A.,
W80-03781 5C

The Release of Reactive Phosphate by a Posidonia Australis Seagrass Community,
W80-03808 2A

ROSWELL (N MEX)
Low Pressure Brackish Water Reverse Osmosis Membrane Development - Final Report,
W80-03749 3A

ROTENONE
Rotenone Resistance of Golden Shiners from a Periodically Reclaimed Pond,
W80-03702 5A

RUNOFF
Optimization of Unit Hydrograph Determination,
W80-03617 2E

Role of Rill Development in Salt Loading from Hillslopes,
W80-03643 2J

The Geomorphologic Structure of Hydrologic Response,
W80-03743 2A

A Parametric Model Calibrated with a Physically Based Model for Runoff Prediction from Ungaged Streams,
W80-03839 2E

RUNOFF COLD REGIONS
Hydrologic Role of Shallow Organic Soils in Cold Climates,
W80-03649 2G

SADDLE RIVER BASIN (NJ)
The Influence of Urbanization of the Transport of Heavy Metals in New Jersey Streams,
W80-03774 5B

SALINE SOILS
Reclamation of Saline-Sodic Soils by Leaching,
W80-03723 2G

SALINITY
The Effect of the Degree of Mineralization of Water on Phytoplankton,
W80-03664 5A

SALMONELLA
Mutagenicity of Fluorene Derivatives: A Proposed Mechanism,
W80-03745 5A

SALT MARSHES
An Artificial Microbial Ecosystem for Determining Effects and Fate of Toxicants in a Salt-Marsh Environment,
W80-03670 5A

A Nutritional Analysis of a Sublittoral Diatom Assemblage Epiphytic on Enteromorpha from a Long Island Salt Marsh,
W80-03862 2I

The Ecology of a Saltmarsh in Sri Lanka,
W80-03871 2I

Comparison of the Assemblages of Sap-Feeding Insects (Homoptera-Hemiptera) Inhabiting Two Structurally Different Salt Marsh Grasses in the Genus Spartina,
W80-03881 2I

SALT YIELD
Role of Rill Development in Salt Loading from Hillslopes,
W80-03643 2J

SALVINIA
A New Approach for Salvinia Control,
W80-03827 4A

SAMPLING
Preparation of Friable Aquiferous Specimens,
W80-03719 8E

SAN CLEMENTE ISLAND (CALIF)
Seasonal Variations in Net Photosynthetic Performance and Cover of Intertidal Macrophytes,
W80-03660 5C

SAN JUAN BASIN
Ground Water in the San Juan Basin, New Mexico and Colorado,
W80-03763 2F

SAND WAVES
Turbulence Measurements in the Boundary Layer Over a Sand Wave Field,
W80-03626 2E

SCALLOPS
Copper Toxicity to the Bay Scallop (Argopecten Irradians),
W80-03689 5C

SCENEDESMUS
Semicontinuous Outdoor Cultivation of Scenedesmus Acutus in Waste Water,
W80-03705 5A

SCHELDT ESTUARY
Behaviour of Manganese in the Rhine and Scheldt Estuaries, II. Geochemical Cycling,
W80-03630 2L

SCOTLAND COAST
The Islay Front: Physical Structure and Phytoplankton Distribution,
W80-03733 2L

SCREENS
Combined Sewer Overflow Treatment by Screening and Terminal Ponding -- Fort Wayne, Indiana,
W80-03656 5D

SEAGRASS
The Release of Reactive Phosphate by a Posidonia Australis Seagrass Community,
W80-03808 2A

SEAGRASSES
Taxonomic Notes on Epiphytic Diatoms of Mississippi Sound, U.S.A.,
W80-03781 5C

SEASONAL
Seasonal Variations in Net Photosynthetic Performance and Cover of Intertidal Macrophytes,
W80-03660 5C

Seasonal Occurrence and Variation in Standing Crop of a Drift Algal Community in the Indian River, Florida,
W80-03803 5C

Seasonal Changes of Bacterioplankton in a Reservoir Related to Algae. I. Numbers and Biomass,
W80-03811 5C

Seasonal Variation in the Biomass, Tuber Density, and Photosynthetic Metabolism of Hydrilla in Three Florida Lakes,
W80-03834 5C

SEDIMENT DISTRIBUTION
Langebaan Lagoon: A Mixed Carbonate-Siliciclastic Tidal Environment in a Semi-Arid Climate,
W80-03865 2J

SEDIMENT TRANSPORT
A Reexamination of Bagnold's Granular-Fluid Model and Bed Load Transport Equation,
W80-03625 2J

SEDIMENT YIELD
Role of Rill Development in Salt Loading from Hillslopes,
W80-03643 2J

SEDIMENTATION
An Empirical Model for Physical Parameters of Recent Sedimentary Deposits of Lake Ekoln and Lake Vanern,
W80-03790 5A

Holocene Sedimentation at Cape Sable, South Florida,
W80-03864 2J

SEDIMENTATION RATES
Recent Geochemical History of Flood Deposits in the Northern Chesapeake Bay,
W80-03735 2J

SEDIMENTS
Particle Reworking in Sediments from the New York Bight Apex: Evidence from 234Th/238U Disequilibrium,
W80-03629 2J

Suspended Material Distributions in the Wake of Estuarine Channel Dredging Operations,
W80-03631 2J

Sediments Suspended in Stream Flow,
W80-03718 2J

The Nutritional Ecology of Cyperus Esculentus, an Emergent Aquatic Plant, Grown on Different Sediments,
W80-03786 2I

An Empirical Model for Physical Parameters of Recent Sedimentary Deposits of Lake Ekoln and Lake Vanern,
W80-03790 5A

Effects of Mine Drainage on the River Hayle, Cornwall (A) Factors Affecting Concentrations of Copper, Zinc and Iron in Water, Sediments and Dominant Invertebrate Fauna,
W80-03891 5C

Organochlorine Insecticides and PCBs in Sediments of Lake St. Clair (1970 and 1974) and Lake Erie (1971),
W80-03894 5C

Incorporation, Distribution and Fate of Saturated Petroleum Hydrocarbons in Sediments from a Controlled Marine Ecosystem,
W80-03899 5C

Sterols in Natural Water and Sediment,
W80-03900 5C

SELENIUM
Organochlorine, Fluorine, and Heavy-Metal Levels in Some Birds from New Zealand Estuaries,
W80-03691 5B

SEPARATED SEWERS
Characteristics of Effluents from Gray and Black Water Septic Tanks,
W80-03791 5B

SEPARATION TECHNIQUES
Method for Removing Suspended Oil Droplets from Water,
W80-03647 5D

SEPTIC TANKS
Characteristics of Effluents from Gray and Black Water Septic Tanks,
W80-03791 5B

SESSILE ALGAE
Taxonomic Notes on Epiphytic Diatoms of Mississippi Sound, U.S.A.,
W80-03781 5C

SEWAGE DISPOSAL
A Review of New Colorado Water and Air Pollution Legislation,
W80-03668 6E

SEWAGE EFFLUENTS
Investigations on the Effects of Domestic Sewage on the Benthic Ecosystem of Marine Intertidal Flats (In German),
W80-03684 5C

SEWAGE SLUDGE
Enterovirus Inactivation in Soil and Structural Changes Associated with the Inactivation of Soil-Bound Viruses,
W80-03603 3C

The Effect of Phosphate and Temperature on Growth of Activated Sludge and on Biodegradation of Surfactants,
W80-03793 5D

SEWERAGE
The Distribution and Ecology of the Naididae (Oligochaeta) Which Inhabit the Filter-Beds of Sewage-Works in Britain,
W80-03666 5C

SHANNON-WIENER INDEX
Macroinfaunal Structure and Effects of Thermal Discharges in a Mesohaline Habitat of Chesapeake Bay, Near a Nuclear Power Plant,
W80-03672 5C

SHEAR
Flow Visualization in Complex Turbulent Flows,
W80-03715 8B

SHELLFISH FARMING
Legal and Institutional Factors Affecting Mariculture in Texas,
W80-03873 6E

SHINERS
Rotenone Resistance of Golden Shiners from a Periodically Reclaimed Pond,
W80-03702 5A

SHORE PROTECTION
Water Resource Policies and Authorities: Federal Participation in Shore, Hurricane, Tidal and Lake Flood Protection (Final Rule).
W80-03877 6E

Marine Resources Committee-Annual Review of Significant Legislative, Judicial and Administrative Activities During 1977.
W80-03889 6E

SHRIMP
The Influence of Acclimation Temperature on the Interactions of Chlorine, Elevated Temperature, and Exposure Duration for Grass Shrimp, Palaemonetes Pugio,
W80-03704 5A

A Bioeconomic Model of the Gulf of Mexico Shrimp Fishery,
W80-03845 8I

SIMULATED RAINFALL
A Rainfall Simulator with Nonrepetitious Movement of Drop Outlets,
W80-03726 2B

SIMULATION
An Interactive River Basin Water Management Model: Synthesis and Application,
W80-03708 6A

SIOUX COUNTY (N DAK)
Ground-Water Resources of Grant and Sioux Counties, North Dakota,
W80-03767 2F

SIZE
Body Size and Feeding Ecology as Alternatives to Taxonomy for the Study of Limnetic Zooplankton Community Structure,
W80-03815 5A

Pigovian Taxes, Polluter Subsidies, Regulation, and the Size of a Polluting Industry,
W80-03848 6E

SKELLEFTE BAY
Flow in the Sea of Heavy Metals from a Smelter Industry,
W80-03788 5B

SLUDGE DISPOSAL
The Field Assessment of Effects of Dumping Wastes at Sea: 3. A Survey of the Sewage Sludge Disposal Area in Lyme Bay,
W80-03696 5A

SNAKE RIVER
Effects of Dams and Impoundments on Migrations of Juvenile Chinook Salmon and Steelhead from the Snake River, 1966 to 1975,
W80-03701 5A

SNOWMELT RUNOFF
Hydraulic Conductivity of Mountain Soils,
W80-03775 2C

SOCIAL ADJUSTMENT
Systems Ecology, People Ecology, and the Anthropology of Fishing Communities,
W80-03860 6B

SOCIAL ASPECTS
Chesapeake Bay Future Conditions Report. Appendix 3. Economic and Social Profile.
W80-03844 6B

Estimating Willingness to Pay: Why and How.,
W80-03846 6B

Employment in the Fishing Industry: Some Preliminary Findings on Fishermen's Mobility,
W80-03856 6F

SOCIAL IMPACT
Systems Ecology, People Ecology, and the Anthropology of Fishing Communities,
W80-03860 6B

SOCIAL MOBILITY
Employment in the Fishing Industry: Some Preliminary Findings on Fishermen's Mobility,
W80-03856 6F

SOIL BACTERIA
Enterovirus Inactivation in Soil and Structural Changes Associated with the Inactivation of Soil-Bound Viruses,
W80-03603 3C

SOIL COMPACTION
Infiltration of Soils as Affected by the Pressure and Water Content at the Time of Compaction,
W80-03722 2G

SOIL EROSION
Soil and Water Losses from Corn-Soybean Rotations,
W80-03725 2J

SOIL MOISTURE
Snowmelt Infiltration Into Seasonally Frozen Soils,
W80-03650 2G

Measured and Approximate Flux-Concentration Relations for Absorption of Water by Soil,
W80-03721 2G

SOIL TEMPERATURE
Harper Seeks Climate Control with Sprinkled Vegetables,
W80-03658 2I

SOIL WATER
Snowmelt Infiltration Into Seasonally Frozen Soils,
W80-03650 2G

Measured and Approximate Flux-Concentration Relations for Absorption of Water by Soil,
W80-03721 2G

SOIL WATER MOVEMENT
Comparative Study of Groundwater Recharge Rates in Parts of Indo-Gangetic and Sabarmati Alluvial Plains,
W80-03636 2F

Determination of Selected Hydraulic Properties of Subarctic Soils,
W80-03648 2G

Effect of Tillage on Soil-Water Movement During Corn Growth,
W80-03724 2G

Influence of a Compact Zone on Solute Transport During Infiltration of Water,
W80-03727 2G

Hydraulic Conductivity of Mountain Soils,
W80-03775 2C

SOILS
On the Value of Soil Columns for Assessing the Transport Pattern of Viruses Through Soils: A Critical Outlook,
W80-03622 5B

SOLAR DISTILLATION
Technical and Economic Assessment of Solar Distillation for Large Scale Production in Fresh Water.
W80-03842 3A

SOLUTES
Influence of a Compact Zone on Solute Transport During Infiltration of Water,
W80-03727 2G

SOLVENTS
Quantitative Extraction of Chlorinated Organic Pesticides and Polychlorinated Biphenyls from Fish Organs and Tissues,
W80-03674 5A

SOUTHERN CALIFORNIA
Nitrate and Phytoplankton Production in Southern California Coastal Waters,
W80-03789 5C

SOUTHWEST FLORIDA
Summary of U.S. Geological Survey Investigations and Hydrologic Conditions in the Southwest Florida Water Management District for 1978,
W80-03771 7C

SOUTHWEST MONTANA
Structural Controls of Hot-Spring Systems in Southwestern Montana,
W80-03760 1A

SOYBEANS
Soil and Water Losses from Corn-Soybean Rotations,
W80-03725 2J

SPATIAL DISTRIBUTION
Spatial Aspects of the Pressure for Shoreline Development: The Example of Puget Sound,
W80-03884 6E

SPECIATION
Species Composition and Seasonal Occurence of Centric Diatoms in a Polluted Marine Environment,
W80-03820 5C

SPECIES DIVERSITY
Macroinfaunal Structure and Effects of Thermal Discharges in a Mesohaline Habitat of Chesapeake Bay, Near a Nuclear Power Plant,
W80-03672 5C

Zooplankters as Bioindicators of Water Quality,
W80-03678 5C

Investigations on the Effects of Domestic Sewage on the Benthic Ecosystem of Marine Intertidal Flats (In German),
W80-03684 5C

The Field Assessment of Effects of Dumping Wastes at Sea: 3. A Survey of the Sewage Sludge Disposal Area in Lyme Bay,
W80-03696 5A

SPECIES DIVERSITY INDICES
Macroinfaunal Structure and Effects of Thermal Discharges in a Mesohaline Habitat of Chesapeake Bay, Near a Nuclear Power Plant,
W80-03672 5C

Zooplankters as Bioindicators of Water Quality,
W80-03678 5C

SPEICATION
Very Simple Model of the Initial Stage of Oligotrophic-Eutrophic Succession. In Bodies of Water,
W80-03792 5A

SPILLWAYS
Hydraulics of Rectangular Vertical Drop Structures,
W80-03739 2E

SPOKANE (WASH)
Selected Hydrologic Data for Spokane Valley, Spokane, Washington, 1977-78,

ST. LAWRENCE RIVER
Hydrochemistry of Dissolved Inorganic Carbon in the St. Lawrence Estuary (Canada),
W80-03736 2L

STANDING CROPS
Seasonal Occurrence and Variation in Standing Crop of a Drift Algal Community in the Indian River, Florida,
W80-03803 5C

STATIONS
Index to Sources of Hydrologic Data,
W80-03744 7C

STATISTICAL ANALYSIS
Statistical Analysis of Hydrologic Critical Droughts,
W80-03618 2E

STEADY FLOW
Measurements of Combined Oscillatory and Steady Flow Over a Rough Bed,
W80-03620 8B

STILLING WELL
Instrumentation of Urban Hydrology Monitoring Sites in Southeast Florida,
W80-03766 7B

STOCHASTIC PROCESSES
Statistical Analysis of Hydrologic Critical Droughts,
W80-03618 2E

STORM DRAINS
Screening/Flotation Treatment of Combined Sewer Overflows, Volume II: Full-Scale Operation Racine, Wisconsin,
W80-03652 5D

Combined Sewer Overflow Treatment by Screening and Terminal Ponding -- Fort Wayne, Indiana,
W80-03656 5D

STORM RUNOFF
Disinfection/Treatment of Combined Sewer Overflows, Syracuse, New York,
W80-03651 5D

Screening/Flotation Treatment of Combined Sewer Overflows, Volume II: Full-Scale Operation Racine, Wisconsin,
W80-03652 5D

Erosional Aspects of Managing Urban Streams,
W80-03773 2J

STORMS
Forecasting Storm Rainfall Over Bhagirathi Catchment Due to Depressions/Cyclonic Storms,
W80-03635 2B

STRATIFIED FLOW
On the Magnitude of Interfacial Shear of Subcritical Stratified Flows in Relation with Interfacial Stability,
W80-03738 2E

STRATIGRAPHY
Age, Origin, and Palaeo-Ecological Evidence of Blanket Bogs in Nord-Trondelag, Norway,
W80-03868 2J

STREAM STABILIZATION
Erosional Aspects of Managing Urban Streams,
W80-03773 2J

STREAMFLOW
Sediments Suspended in Stream Flow,
W80-03718 2J

Water-Quality Assessment of the L'Anguille River Basin, Arkansas,
W80-03758 5B

Low-Flow Characteristics of Streams in the Pecatonica-Sugar River Basin, Wisconsin,
W80-03765 2E

STREAMS
Water-Quality Assessment of the L'Anguille River Basin, Arkansas,
W80-03758 5B

A Technique for Estimating Heights Reached by the 100-Year Flood on Unregulated, Nontidal Streams in North Carolina,
W80-03764 2E

Stream Types in Idaho: An Approach to Classification of Streams in Natural Areas,
W80-03835 6B

STRONTIUM RADIOISOTOPES
Eye Damage to the Grass Carp (Ctenopharyngodon Idella) from Chronic Uptake of Strontium 90,
W80-03697 5C

STRUCTURAL GEOLOGY
Structural Controls of Hot-Spring Systems in Southwestern Montana,
W80-03760 1A

STRUCTURES
Hydraulics of Rectangular Vertical Drop Structures,
W80-03739 2E

SUBARCTIC
Hydrologic Role of Shallow Organic Soils in Cold Climates,
W80-03649 2G

Seasonal Succession of Phytoplankton in a Large Subarctic River,
W80-03824 5C

SUBARTIC
Determination of Selected Hydraulic Properties of Subarctic Soils,
W80-03648 2G

SUBCRITICAL FLOW
On the Magnitude of Interfacial Shear of Subcritical Stratified Flows in Relation with Interfacial Stability,
W80-03738 2E

SUBMARINE SLIDES
Submarine Slide-Generated Water Waves in Kitimat Inlet, British Columbia,
W80-03627 2L

SUBSTRATES
A Periphyton Growth Substrate Useful for Nutrient Impact Studies in Large Rivers,
W80-03665 5A

SUBSURFACE WATERS
Geology and Geochemistry of Arsenic, Ester Dome Area, Alaska,
W80-03712 2K

SUCCESSION
Very Simple Model of the Initial Stage of Oligotrophic-Eutrophic Succession. In Bodies of Water,
W80-03792 5A

Seasonal Succession of Phytoplankton in a Large Subarctic River,
W80-03824 5C

SUNFISHES
Transfer of 14C-Toluene from Mosquito Larvae to Bluegill Sunfish,
W80-03686 5B

SURFACE RUNOFF
A Parametric Model Calibrated with a Physically Based Model for Runoff Prediction from Ungaged Streams,
W80-03839 2E

SURFACE WATERS
Water Resources Data for Indiana, Water Year 1978.
W80-03752 7C

Water Resources Data for Alaska, Water Year 1978.
W80-03753 7C

Water Resources Data for Florida, Water Year 1978--Volume 3A-1. Southwest Florida Surface Water.
W80-03754 7C

Water Resources Data for Florida, Water Year 1978--Volume 3A-2. Southwest Florida Surface Water Quality.
W80-03755 7C

Hydrologic Data for Wells, Springs, and Streams in Boulder County, Colorado,
W80-03757 2A

Surface-Water Features in Osceola County and Adjacent Areas, Florida,
W80-03761 7C

SURFACTANTS
Manganese Removal from Water by Flotation with Microgas Dispersions,
W80-03748 5F

The Effect of Phosphate and Temperature on Growth of Activated Sludge and on Biodegradation of Surfactants,
W80-03793 5D

A New Approach for Salvinia Control,
W80-03827 4A

SUSPENDED SOLIDS
Suspended Material Distributions in the Wake of Estuarine Channel Dredging Operations,
W80-03631 2J

Determinants of Water Quality in Agricultural Watersheds,
W80-03709 5G

Sediments Suspended in Stream Flow,
W80-03718 2J

SWAMPS
Comparative Biomass and Growth of Cypress in Florida Wetlands,
W80-03866 2I

SYRACUSE (NY)
Disinfection/Treatment of Combined Sewer Overflows, Syracuse, New York,
W80-03651 5D

SYSTEMATICS
Taxonomic Notes on Epiphytic Diatoms of Mississippi Sound, U.S.A.,
W80-03781 5C

Body Size and Feeding Ecology as Alternatives to Taxonomy for the Study of Limnetic Zooplankton Community Structure,
W80-03815 5A

TAMPA BAY (FL)
The Effects of Oyster Shell Dredging on an Estuarine Benthic Community,
W80-03734 2L

TARPON SPRINGS (FL)
Chemical Fluctuations Due to Seasonal and Cropping Effects on an Algal-Seagrass Community,
W80-03785 2I

TEMPERATURE
The Effect of Phosphate and Temperature on Growth of Activated Sludge and on Biodegradation of Surfactants,
W80-03793 5D

Nitrogen Fixation by Thermophilic Blue-Green Algae (Cyanobacteria): Temperature Characteristics and Potential Use in Biophotolysis,
W80-03796 5F

Temperature Effects on Steady-State Growth, Phosphorus Uptake, and the Chemical Composition of a Marine Phytoplankter,
W80-03804 5C

TEMPERATURE CONTROL
Harper Seeks Climate Control with Sprinkled Vegetables,
W80-03658 2I

TENNESSEE
Public Water Supplies: The Effect of Federal and Tennessee Water Resource Law,
W80-03601 6E

TERATOGENS
Studies on the Effects of Acidic Medium on the Fry of Cyprinus Carpio,
W80-03706 5A

TERRAIN ANALYSIS
Interpretation of Unenhanced Landsat Imagery for Wetland and Land Use Delineation in the Texas Coastal Zone,
W80-03878 7C

TEXAS
Legal and Institutional Factors Affecting Mariculture in Texas,
W80-03873 6E

Interpretation of Unenhanced Landsat Imagery for Wetland and Land Use Delineation in the Texas Coastal Zone,
W80-03878 7C

THAMES RIVER (CT)
Suspended Material Distributions in the Wake of Estuarine Channel Dredging Operations,
W80-03631 2J

THEORETICAL ANALYSIS
Hedonic Prices, Property Values and Measuring Environmental Benefits: A Survey of the Issues,
W80-03847 6B

Fishermen's Remuneration Systems and Implications for Fisheries Development,
W80-03858 6C

THERMAL SPRINGS
Mixing Models and Ionic Geothermometers Applied to Warm (Up to 60C) Springs: Jordan Rift Valley, Israel,
W80-03728 2K

THERMAL WATER
Thermal Modeling of Highly Transient Flows in the Chattahoochee River Near Atlanta, Georgia,
W80-03615 2E

THERMODYNAMIC BEHAVIOR
An Analysis of the Irreversible Thermodynamics Model for Coupled Heat and Moisture Transport Phenomena in Unsaturated Porous Media,
W80-03639 1A

TIDAL EFFECTS
Ocean Tide Effect Study on a Coastal Carbonate Aquifer (Miocene of Algarve, Portugal) ((Etude De L'Effet De Maree Oceanique Sur Un Aquifere Carbonate Cotier (Miocene De L'Algarve--Portugal)),
W80-03731 2F

TIDAL WATERS
The Sublittoral Ecology of the Menai Strait, I. Temporal and Spatial Variation in the Fauna and Flora Along a Transect,
W80-03634 2L

Tidal Hydraulics in Estuarine Channels,
W80-03714 2L

TIDES
Tidal Hydraulics in Estuarine Channels,

TISSUE ANALYSIS
The Absorption of DDT by Vascular Aquatic Plants,
W80-03663 5B

Identification of Organic Sulfur Compounds Transferred to Fish from Petroleum Suspension by Mass Chromatography,
W80-03671 5B

Quantitative Extraction of Chlorinated Organic Pesticides and Polychlorinated Biphenyls from Fish Organs and Tissues,
W80-03674 5A

Extraction and Accumulation of 210Pb by Aquatic Organisms in Lakes,
W80-03677 5B

In Vitro Inhibition of Three Phosphatases by Mercuric Chloride and Their Reversal by Chelating Agent EDTA,
W80-03685 5A

Transfer of 14C-Toluene from Mosquito Larvae to Bluegill Sunfish,
W80-03686 5B

Mobilization of Organochlorines from Female Lipid Tissue and Transplacental Transfer to Fetus in a Harbour Porpoise (Phocoena Phocoena) in a Contaminated Area,
W80-03687 5B

Copper Toxicity to the Bay Scallop (Argopecten Irradians),
W80-03689 5C

Organochlorine, Fluorine, and Heavy-Metal Levels in Some Birds from New Zealand Estuaries,
W80-03691 5B

Chemotherapeutical Studies on Trimethoprim Against Vibriosis of Pond-Cultured Ayu--II. Tissue Levels After Administration of Trimethoprim-Sulfadoxine Mixture (In Japanese),
W80-03693 5B

Eye Damage to the Grass Carp (Ctenopharyngodon Idella) from Chronic Uptake of Strontium 90,
W80-03697 5C

Pesticides and Aquatic Ecosystems,
W80-03699 5C

TJEUKEMEER (THE NETHERLANDS)
Effect of Benzoate on Microbial Decomposition of Fulvic Acids in Tjeukemeer (The Netherlands),
W80-03893 2K

TMP
Chemotherapeutical Studies on Trimethoprim Against Vibriosis of Pond-Cultured Ayu--II. Tissue Levels After Administration of Trimethoprim-Sulfadoxine Mixture (In Japanese),
W80-03693 5B

TOLUENE
Transfer of 14C-Toluene from Mosquito Larvae to Bluegill Sunfish,
W80-03686 5B

TORCH LAKE (MI)
Sterols in Natural Water and Sediment,
W80-03900 5C

TOXICITY
Macroinfaunal Structure and Effects of Thermal Discharges in a Mesohaline Habitat of Chesapeake Bay, Near a Nuclear Power Plant,
W80-03672 5C

Variation in the Reactions of Daphnia Magna Straus to the Effect of a Toxicant as Related to Its Delivery Regime,
W80-03676 5A

Dependence of the Time of Gamete Maturation and Spawning on Environmental Temperature in the Virginia Oyster Crassostrea Virginica,
W80-03679 5C

The Relationship Between Vertebral Number and Water Temperature in Cod,
W80-03680 5A

A Review of the Lethal and Sub-Lethal Effects of Mercury on Aquatic Life,
W80-03683 5A

Investigations on the Effects of Domestic Sewage on the Benthic Ecosystem of Marine Intertidal Flats (In German),
W80-03684 5C

Copper Toxicity to the Bay Scallop (Argopecten Irradians),
W80-03689 5C

Studies on the Effects of Acidic Medium on the Fry of Cyprinus Carpio,
W80-03706 5A

Secondary Toxicology and Contaminants of Algae Grown on Wastewater,
W80-03818 3C

TRACE ELEMENTS
Trace Element Loading of Southern Lake Michigan by Dry Deposition of Atmospheric Aerosol,
W80-03621 5B

TRAFFORD LAKE (FL)
Seasonal Variation in the Biomass, Tuber Density, and Photosynthetic Metabolism of Hydrilla in Three Florida Lakes,
W80-03834 5C

TRAPA
Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-Iri Bay of Lake Kasumigaura, Japan, II Role of Waterchestnut in Primary Productivity and Nutrient Uptake,
W80-03681 5B

TREES
Early Growth of Picea Sitchensis (Bong.) Carr on Deep Oligotrophic Peat in Northern Ireland,
W80-03863 2I

TRITIUM
Paul Spring: An Investigation of Recharge in the Roswell (NM) Artesian Basin,
W80-03642 2F

TUCSON BASIN
The Economic Consequences of Allocating Groundwater to Competing Interest in the Santa Cruz Basin, Pima County, Arizona,
W80-03707 6E

TURBULENCE
Turbulence Measurements in the Boundary Layer Over a Sand Wave Field,
W80-03626 2E

Flow Visualization in Complex Turbulent Flows,
W80-03715 8B

TURBULENCE ENERGY CLOSURE MODELS
On the Calculation of the Width Averaged Flow Due to Long Waves in an Open Channel,
W80-03619 2E

TURBULENT BOUNDARY LAYERS
On the Calculation of the Width Averaged Flow Due to Long Waves in an Open Channel,
W80-03619 2E

TURBULENT FLOW
On the Calculation of the Width Averaged Flow Due to Long Waves in an Open Channel,
W80-03619 2E

TURFGRASSES
Measuring Evapotranspiration of Turfgrass,

WATER-ROCK INTERACTION
Kinetics of Chemical Processes in a Carbonate Aquifer: A Case Study of Water-Rock Interaction in the Aquifer of Western and Central Galilee (Israel),
W80-03730 2K

WATER SUPPLY
Residential Water Reuse,
W80-03640 3D

Rangia Cuneata in An Industrial Water System (Bivalvia: Mactridae),
W80-03669 5A

An Interactive River Basin Water Management Model: Synthesis and Application,
W80-03708 6A

Development of Ground Water in the Houston District, Texas, 1970-74,
W80-03768 4B

The Analysis of Risk in Irrigation Projects in Developing Countries,
W80-03851 6B

WATER TEMPERATURE
An Analysis of the Irreversible Thermodynamics Model for Coupled Heat and Moisture Transport Phenomena in Unsaturated Porous Media,
W80-03639 1A

Dependence of the Time of Gamete Maturation and Spawning on Environmental Temperature in the Virginia Oyster Crassostrea Virginica,
W80-03679 5C

The Relationship Between Vertebral Number and Water Temperature in Cod,
W80-03680 5A

The Influence of Acclimation Temperature on the Interactions of Chlorine, Elevated Temperature, and Exposure Duration for Grass Shrimp, Palaemonetes Pugio,
W80-03704 5A

Distribution of Bacteria and Chlorophyll A at a Nearshore Station in Lake Ontario,
W80-03822 5C

WATER TREATMENT
Effect of Particulates on Ozone Disinfection of Bacteria and Viruses in Water,
W80-03654 5F

Estimating Water Treatment Costs, Volume 4. Computer User's Manual for Retrieving and Updating Cost Data,
W80-03655 5F

Manganese Removal from Water by Flotation with Microgas Dispersions,
W80-03748 5F

WATER USER
The Economic Consequences of Allocating Groundwater to Competing Interest in the Santa Cruz Basin, Pima County, Arizona,
W80-03707 6E

WATER UTILIZATION
Guidelines for Socioeconomic Impact Analyses of Environmental Regulations,
W80-03602 6C

WATER YIELD
Ground-Water Resources of Grant and Sioux Counties, North Dakota,
W80-03767 2F

WATERCHESTNUT
Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-Iri Bay of Lake Kasumigaura, Japan, II Role of Waterchestnut in Primary Productivity and Nutrient Uptake,
W80-03681 5B

WATERFOWL
Consumption of Eelgrass, Zostera Marina, by Birds and Invertebrates During the Growing Season in Lake Grevelingen (SW Netherlands),
W80-03819 5C

WATERSHEDS (BASINS)
The Geomorphologic Structure of Hydrologic Response,
W80-03743 2A

Phosphrus Export from Rural Maine Watersheds,
W80-03776 5B

WAVE DAMPING
Damping of Gravity Waves over Porous Bed,
W80-03716 8B

WAVES (WATER)
Submarine Slide-Generated Water Waves in Kitimat Inlet, British Columbia,
W80-03627 2L

The Design and Use of an Oscillating Trolley Wave-Simulator, for Installation in Unidirectional Flow Flumes,
W80-03737 2L

WEIGHT
The Effects of Bottle Volume, Thallus Weight, Oxygen Saturation Levels, and Water Movement on Apparent Photosynthetic Rates in Marine Algae,
W80-03659 5C

WETLANDS
Wetlands of the South-West of Western Australia with Special Reference to the Busselton Area.
W80-03861 2L

Factors Affecting Tissue Nutrient Concentrations in a Scirpus-Equisetum Wetland,
W80-03876 2I

Interpretation of Unenhanced Landsat Imagery for Wetland and Land Use Delineation in the Texas Coastal Zone,
W80-03878 7C

WHISTLING SWAN
Microbial Impact of Canada Geese (Branta Canadensis) and Whistling Swans (Cygnus Columbianus Columbianus) on Aquatic Ecosystems,
W80-03794 5B

WILLAMETTE RIVER BASIN (OR)
River-Quality Assessments.
W80-03606 5B

River-Quality Assessment: Concept, Framework, and Application in the Willamette River Basin, Oregon,
W80-03608 6B

Erosion Potential Assessment for the Willamette River Basin, Oregon,
W80-03613 7C

WILLAMETTE RIVER (OR)
Algal Growth Potential--Lower Willamette River, Oregon,
W80-03614 5B

WILLINGNESS-TO-PAY
Estimating Willingness to Pay: Why and How.,
W80-03846 6B

WISCONSIN
Low-Flow Characteristics of Streams in the Pecatonica-Sugar River Basin, Wisconsin,
W80-03765 2E

WITHDRAWAL
Development of Ground Water in the Houston District, Texas, 1970-74,
W80-03768 4B

WORMS
The Distribution and Ecology of the Naididae (Oligochaeta) Which Inhabit the Filter-Beds of Sewage-Works in Britain,
W80-03666 5C

WYOMING
River-Quality Assessments.
W80-03606 5B

YAMPA RIVER BASIN (CO)
River-Quality Assessments.
W80-03606 5B

Residuals Management: A Tool in River-Quality Assessment Applied to Coal Development in the Yampa River Basin, Colorado,
W80-03616 6B

YELLOWKNIFE RIVER (CANADA)
Seasonal Succession of Phytoplankton in a Large Subarctic River,
W80-03824 5C

ZINC
Effect of Some Chemical Agents on the Uptake of 32p and 65Zn by Macrophytes in the Black Sea,
W80-03662 5B

The Field Assessment of Effects of Dumping Wastes at Sea: 3. A Survey of the Sewage Sludge Disposal Area in Lyme Bay,
W80-03696 5A

ZOOPLANKTON
Zooplankters as Bioindicators of Water Quality,
W80-03678 5C

Zooplankton in a Quasi-Stable Phase in an Endorheic Lake (Lake Chilwa, Malawi),
W80-03807 5C

Two Electivity Indices for Feeding with Special Reference to Zooplankton Grazing,
W80-03810 5C

Body Size and Feeding Ecology as Alternatives to Taxonomy for the Study of Limnetic Zooplankton Community Structure,
W80-03815 5A

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 13, NUMBER 12
JUNE 15, 1980

W80-03901 -- W80-04200
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the
Office of Water Research and Technology
U.S. Department of the Interior

VOLUME 13, NUMBER 12
JUNE 15, 1980

W80-03901 -- W80-04200

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most our our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographic citation and a set of identifiers or descriptors which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Office of Water Research and Technology.

To provide SWRA with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

The input from these Centers, and from the 54 Water Resources Research Institutes administered under the Water Research and Development Act of 1978, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies becomes the information base from which this journal is derived.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology
U.S. Department of the Interior
Washington, D.C. 20240

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

GROUND WATER INTERACTIONS WITH WETLANDS,
Lowell Univ., MA. Dept. of Earth Sciences.
A. L. O'Brien.
Well Log, Vol 10, No 11, p 49-50, December, 1979. 6 Ref. OWRT-B-012-MASS(9).

Descriptors: *Wetlands, *Massachusetts, Swamps, *Ground water, Subsurface waters, Aquifers, *Aquifer characteristics, *Discharge, Effluent streams, *Groundwater movement, *Groundwater recharge, Surface-groundwater relationships, Water table.

Wetlands in Massachusetts commonly occur in association with potential aquifers: stratified drift, lake bottom deposits, and alluvium. The relationship of wetlands to ground-water and the underlying deposit is shown by a water budget analysis of a wetland in eastern Massachusetts. Monitoring showed a close coupling between ground-water and the stream which resulted in rapid ground-water discharge during flood events. In fact, 93% of the total annual discharge was due to ground-water. This rapid ground-water discharge from a shallow upper layer of the ground-water body resulted in high spring discharges and little low flow augmentation in the summer. Such patterns of discharge should be considered whenever ground-water is developed from wetland associated aquifers.

DISCHARGE RESPONSE ANALYSIS AND HYDROLOGIC SIMILARITY: THE INTERRELATION BETWEEN THE GEOMORPHOLOGIC IUH AND THE STORM CHARACTERISTICS,
Universidad Simon Bolivar, Caracas (Venezuela).
I. Rodriguez-Iturbe, G. Devoto, and J. B. Valdes.
Water Resources Research, Vol 15, No 6, p 1435-1444, December 1979. 14 Fig, 4 Tab, 11 Ref.

Descriptors: *Watersheds(Basins), *Rainfall, *Runoff, *Model studies, Mathematical models, Hydraulic similitude, Geomorphology, Discharge(Water), Streamflow, Dynamic programming, Storms, Storm runoff, Drainage, Hydrographs, Unit hydrographs, Synthetic hydrology, Hydrology, Hydrologic similarity, Geomorphic structure, Hydrologic response.

It was shown that the dynamic parameter nu of the geomorphologic instantaneous unit hydrograph (IUH) can be taken as the velocity at the peak discharge time for a given rainfall-runoff event in a basin. This transforms the time variant IUH throughout the event into a time invariant IUH in each storm occurrence. The errors which the a priori estimation of the velocity in the IUH may cause in the calculation of the peak and time to peak of the runoff discharge were estimated for different types of basins and storms; the relative weights of the storm characteristics and the drainage network parameters in the prediction procedure were also studied in detail. Drainage basins were defined as hydrologically similar if they have the same IUH when kinematic conditions were kept the same; through the geomorphologic IUH theory it was shown that the controlling parameter in hydrologic similarity is (R sub L) to the 0.43 power/l sub omega. (Sims-ISWS)
W80-03957

A RAINFALL-RUNOFF ANALYSIS OF THE GEOMORPHOLOGIC IUH,
Universidad Simon Bolivar, Caracas (Venezuela).
J. B. Valdes, Y. Fiallo, and I. Rodriguez-Iturbe.
Water Resources Research, Vol 15, No 6, p 1421-1434, December 1979. 20 Fig, 1 Tab, 8 Ref.

Descriptors: *Watersheds(Basins), *Geomorphology, *Rainfall, *Runoff, *Model studies, *Puerto Rico, Mathematical models, Rainfall-runoff relationships, Hydrologic properties, Streamflow, Hydrographs, Unit hydrographs, Synthetic hydrology, On-site investigations, Hydrology, *Venezuela, Hydrologic response, Geomorphologic structure.

The instantaneous unit hydrograph (IUH) derived from the geomorphologic characteristics of a basin and a timing component, the velocity of the discharge, was presented by Rodriguez-Iturbe and Valdes. To analyze this geomorphologic IUH in real world basins, a study was carried out on several basins in Venezuela and Puerto Rico. The geomorphologic IUH for each basin was compared with the IUH's derived from the discharge hydrograph produced by a physically based rainfall-runoff model of the same basins. The effects that the nonlinearities of the rainfall-runoff model have on the derivation of the IUH were analyzed, and further, controlled experiments were carried out in which the IUH was derived under constant velocity conditions. The geomorphologic IUH's and the ones obtained in the experiments were remarkably similar in all the basins analyzed. (Sims-ISWS)

MEASUREMENTS OF RAINFALL INTENSITY, INSTRUMENTATION AND DATA PROCESSING,
Forsvarets Forskningsanstalt FOA, Stockholm (Sweden).
S. Wickerts, and S. Granath.
FOA rapport C 30157-E2, E1, January 1979. 31 p, 27 Fig, 2 Ref.

Descriptors: *Climatic data, *Rainfall intensity, *Instrumentation, *Data storage and retrieval, Precipitation(Atmospheric), Measurement, Data processing, Rain gages, On-site tests, Data transmission, Automation, Sampling, Foreign research, Statistical methods, Calibrations, On-site data collections, Precipitation gages, *Sweden.

At the National Defense Research Institute (FOA), a system for measuring the rainfall intensity was developed. The measurements with the complete system started in June 1977, and the continued measurements are planned to go on at least until 1980. In this paper the equipment, including the data-collecting system, was described in the first part. The second part of the paper dealt with the data handling from recording over corrections and checks via multiplication with the calibration factors to a data base containing rainfall rate (mm/H) minutes by minutes during occasions with rain from all the 24 rain gages used in the test area. Also described was some of the statistical treatment done on the data from the above-mentioned data base. (Humphreys-ISWS)

Redesign of the Wessex Water Authority daily and monthly rain gage networks in southwest England was proposed, based on optimal estimation procedures. Accuracy requirements for point and areal rainfall estimates were assessed from a survey of the use of data from the existing network. Root mean square errors of interpolation were calculated for the existing networks of 333 daily gages and 379 monthly gages using estimates of the spatial autocorrelation of daily and monthly rainfall. Maps of the interpolation accuracy were drawn and compared with the accuracy required by users. The accuracies of areal estimates in certain areas were also assessed. Three network configurations were designed of 75, 220, and 297 daily gages. The 220-gage network was found to provide satisfactory accuracies for most users and was adopted for implementation. CHELATION OF DIVALENT METAL IONS BY BROWN ALGAL POLYPHENOLS,
Trondheim Univ. (Norway). Inst. of Marine Biochemistry.
M. A. Ragan, O. Smidsrod, and B. Larsen.
Marine Chemistry, Vol 7, p 265-271, 1979. 1 Fig, 1 Tab, 28 Ref.

Descriptors: *Phaeophyta, *Biochemistry, *Chelation, *Metals, *Marine algae, *Polyphloroglucinols, Chemical reactions, Chemical properties, Phenols, Chemical analysis, Organic compounds, Manganese, Strontium, Magnesium, Calcium, Cadmium, Cobalt, Zinc, Nickel, Lead, Copper, Beryllium.

High-molecular-weight, nondialyzable polyphloroglucinols from the marine brown algae Ascophyllum nodosum and Fucus vesiculosus (Phaeophyceae, Fucales) chelate the divalent metal ions $Sr2(+)$, $Mg2(+)$, $Ca2(+)$, $Be2(+)$, $Mn2(+)$, $Cd2(+)$, $Co2(+)$, $Zn2(+)$, $Ni2(+)$, $Pb2(+)$ and $Cu2(+)$ in weakly acidic aqueous solution. Values of the relative selectivity coefficients k have been calculated relative to $Mn2(+)$; the ionotropic series with the algal polyphenols are similar to those with catechol and pyrogallol. These studies may serve as a guide for the examination of metal chelation by brown algal polyphenols both in situ and after exudation into seawater. (Deal-EIS)

2D. Evaporation and Transpiration

AN ENERGY BUDGET ANALYSIS OF WATER USE BY SALTCEDAR,
Arizona Univ., Tucson. School of Renewable Natural Resources.
L. W. Gay, and L. J. Fritschen.
Water Resources Research, Vol 15, No 6, p 1589-1592, December 1979. 2 Fig, 3 Tab, 6 Ref. OWRT C-6030(No 5235)(6).

Descriptors: *Water utilization, *Tamarisk, *Energy budget, *New Mexico, Evapotranspiration, Phreatophytes, On-site investigations, Arid lands, Energy transfer, Analytical techniques, Analysis, On-site tests, Lysimeters, Latent heat.

Bowen ratio estimates of evapotranspiration (ET) over a stand of saltcedar (Tamarix chinensis) on the Rio Grande floodplain in central New Mexico provide (1) estimates of water use by saltcedar during hot, dry weather, (2) comparisons of ET measured at two different locations within the same stand, and (3) comparison of ET over natural stands with results obtained from four constant-level lysimeters. The mean ET for 5 consecutive days (June 14-18, 1977) was 8.2 mm/d by the Bowen ratio and 7.9 mm/d by the lysimeters. Vegetation on the lysimeters and at the Bowen ratio sites differed in density and vigor in a manner consistent with the evapotranspiration measurements. Given these differences, the agreement between methods was judged excellent. The agreement also substantiates the usefulness of the mobile, although more tedious, energy budget method for estimating evapotranspiration from riparian sites in arid zones. (Humphreys-ISWS)

URBAN LAWN EVAPOTRANSPIRATION--MEASUREMENT AND PREDICTION,
Pool (Charles) and Associates, Inc., Ketchikan, AK.
P. O'Neill, L. Pochop, and J. Borrelli.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 5, p 1050-1053, September-October 1979. 3 Fig, 3 Tab, 9 Ref. OWRT B-035-WYO(7), 14-34-0001-7201.

Descriptors: *Evapotranspiration, *Lawns, *Wyoming, Water rights, Lysimeters, Water users, Grasses, Evaporation, Consumptive use, *Urban lawn evapotranspiration, *Blaney-Criddle formula, Lawn grasses, Residential lawns, Lawn water requirements, Potential evapotranspiration, Lysimeter measurements.

A calibration of the Blaney-Criddle formula based on measurements of evapotranspiration rates directly from urban lawns was presented. Potential evapotranspiration rates were measured in Laramie and Wheatland, Wyoming, during the summers of 1976 and 1977. Measurements were taken using small weighable lysimeters located in lawns surrounding single family residences. The calibrated equations for the Criddle and others and the Soil Conservation Service methods provided improved estimates of evapotranspiration rates suitable for most engineering uses. The test locations represented a wide range of climatic conditions which allowed the calibrated equation to be used for bluegrass at other locations in the western United States. (Roberts-ISWS)

COMPREHENSIVE MONITORING OF METEOROLOGY, HYDRAULICS, AND THERMAL REGIME OF THE SAN DIEGO AQUEDUCT, CALIFORNIA,
Geological Survey, NSTL Station, MS. Water Resources Div.
H. E. Jobson, and A. M. Sturrock, Jr.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $3.00. Geological Survey Professional Paper 1137, 1979. 29 p, 31 Fig, 6 Tab, 5 Ref.

Descriptors: *Energy budget, *Hydrologic cycle, *Aqueducts, *California, *Evaporation, Canals, Data collections, Methodology, Water temperature, Meteorological data, Wind velocity, Solar radiation, Vapor pressure, Flow rates, Evaluation, Forecasting, *San Diego aqueduct(Calif), Concrete-lined canal, Atmospheric radiation, Hydraulic variables.

Water temperature, as well as meteorologic and hydraulic variables which influence the energy budget of the San Diego Aqueduct in southern California, were continuously monitored for a 1-year period beginning July 24, 1973. Incoming solar and atmospheric radiation, windspeed and direction, water temperature, and wet- and dry-bulb air temperatures were recorded at 10-minute intervals at each end of the 26-kilometer concrete-lined canal, while flow-rates and stages were determined at hourly intervals for five locations. Although only daily averaged values are presented in this report, all information necessary for the use and interpretation of these data are presented. Windspeeds were minimum during the early morning hours and maximum during the late afternoon; however, they were variable spatially. On the other hand, incoming radiation and absolute vapor pressure varied little from point to point. (Kosco-USGS)

THERMAL MODELING OF FLOW IN THE SAN DIEGO AQUEDUCT, CALIFORNIA, AND ITS RELATION TO EVAPORATION,
Geological Survey, NSTL Station, MS. Water Resources Div.
H. E. Jobson.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.75. Geological Survey Professional Paper 1122, 1980. 24 p, 21 Fig, 5 Tab, 21 Ref.

Descriptors: *Heat budget, *Model studies, *Canals, *Evaporation, *California, Energy budget, Aqueducts, Heat transfer, Hydrologic cycle, Computer models, Methodology, Data collections, Mass transfer, Water temperature, Air-water interface, Evaluation, Wind velocity, Meteorological data, Solar radiation, Vapor pressure, Flow rates, Monitoring, *San Diego Aqueduct, Concrete-lined canal, Atmospheric radiation, Hydraulic variables.

The thermal balance of the 26-kilometer long concrete-lined San Diego Aqueduct, a canal in southern California, was studied to determine the coefficients in a Dalton type evaporation formula. Meteorologic and hydraulic variables, as well as water temperature, were monitored continuously for a 1-year period. A thermal model was calibrated by use of data obtained during a 28-day period to determine the coefficients which best described the thermal balance of the canal. The coefficients applicable to the San Diego Aqueduct are similar to those commonly obtained from lake evaporation studies except that a greater evaporation at low windspeeds is indicated. The model was verified by use of data obtained during 113 days which did not include the calibration data. These data verified that the derived wind function realistically represents the canal evaporation. An annual evaporation of 2.08 meters was computed which is about 91 percent of the amount of water evaporated annually from nearby class A evaporation pans. (Kosco-USGS)

New Mexico Water Resources Research Institute, New Mexico State University Report No 115, December 1979, 108 p, 21 Fig, 13 Tab, 21 Ref, 4 Append. OWRT B-054-NMEX(2), 14-34-0001-6100.

Descriptors: *Consumptive use, *Evapotranspiration, *Crop production, *Soil-water-plant relationships, *New Mexico, Measurement, Lysimeters, Evaporation pans, Irrigation, Alfalfa, Barley, Corn, Cotton, Rye, Grain sorghum, Bluegrass, Sudangrass, Crop production function, *Blaney Criddle equation.

Alfalfa, barley, bluegrass, corn, cotton, rye, grain sorghum, and sudangrass were grown at selected locations throughout the state of New Mexico. Lysimeters were installed in the center of the fields, and yields, monthly and yearly evapotranspiration rates, were measured in 1976 and 1977. In 1978, a sprinkler-line source was used to irrigate alfalfa and cotton in field plots for the measurement of yields and evapotranspiration. These data and data from other irrigation projects were used to derive crop-production functions for alfalfa, corn, cotton, and grain sorghum. Potential evapotranspiration (PET) was determined at each study area using the methods of Penman, Jensen-Haise, Van Bavel, Priestly-Taylor, net radiation, modified pan, and pan evaporation. These data were combined with the evapotranspiration measured in lysimeters to determine a monthly and yearly crop coefficient by each method used to compute PET. Measured seasonal evapotranspiration values are compared to those computed by these techniques. (Herman-NMex)

2E. Streamflow and Runoff

PERSISTENCE MODELING FOR THE POTOMAC AND ADJACENT RIVERS,
Washington Technical Inst., DC. Water Resources Research Center.
G. K. Young, and R. U. Jettmar.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158280, Price codes: A03 in paper copy, A01 in microfiche. Report No 12, September 1977. 26 p, 7 Fig, 17 Ref. OWRT-B-008-DC(1).

Descriptors: *Mathematical models, *Persistence, *Flow characteristics, Low-flow frequency, Flow rates, Flow duration, Droughts, Low flow, Hydrologic budget, Water shortage, Monte Carlo method, Probability, Statistical models, Least squares method, Critical flow.

Case studies of three rivers are used to analyze a persistence modeling strategy for the generation of synthetic stream flows for drought assessment probabilities and confidence levels. The predominantly unregulated river sites used in the study are the Patuxent River near Unity, Maryland, the Potomac River at Point of Rocks, Maryland, and the Rappahannock River near Fredericksburg, Virginia. In an effort to improve the use of Monte Carlo models to produce drought characteristics from synthetic data, the strategy employed for the study uses least squares to fit theoretic autocorrelation functions to empiric functions. The model is designed to aid in critical period analysis in the designing of reservoirs to meet water requirements by solving the major problem of previous models, having an historic critical period or drought of greater severity than can be captured by the model. A key assumption of the modeling method used is that normalized monthly data are stationary. Flow analysis is discussed and illustrated with a chart. Two types of drought phenomena can be defined from the critical period analysis of historic streamflow, (1) short term drought (extreme low flow for six to eight months), and (2) long term drought (lower than historic yearly average flow for three to five years). Graphs of critical flows are given for the three cases studied. Results show that the least squares method produces lower errors, that all methods produce errors of about 10% or less for critical periods of over three years, and for short droughts all methods produced errors of over 10%. STABILIZED SAND SURFACES FOR OVERLAND FLOW STUDIES,
British Columbia Univ., Vancouver. Dept. of Bio-Resource Engineering.
T. H. Podmore, and J. R. Burney.
Water Resources Research, Vol 15, No 6, p 1647-1648, December 1979. 10 Ref.

Descriptors: *Surfaces, *Hydraulic models, *Overland flow, *Surface sealing, Coatings, Roughness(Hydraulic), Sands, Methodology, Plastics, Polymers, Stabilized sand surfaces.

A method was developed to produce stable durable sand surfaces for use in overland flow studies. Hydraulic and physical characteristics of the surfaces produced could be quantified repetitively without deterioration. Due to the inability to reject undesirable bed forms using Portland cement, polyester resins used for laminating fiberglass were tested. Both clear laminating and casting resins in solution with styrene monomer were used on test samples and on full size beds. The surfaces formed had a variety of channel forms and the appearance of natural wet sand. No deterioration was found following repeated hydraulic testing and measurement of physical surface characteristics. In addition, the beds were solid enough to walk on with some care and provided access to all points. Total time for formation of a surface was approximately 10 days including drying time. IMPACT OF ROAD NETWORKS ON SOUTHEASTERN MICHIGAN LAKESHORE DRAINAGE,
Michigan Univ., Ann Arbor. Dept. of Geography.
E. N. Bannister.
Water Resources Research, Vol 15, No 6, p 1515-1520, December 1979. 5 Fig, 14 Ref.

Descriptors: *Streams, *Drainage, *Michigan, *Lake Michigan, Drainage density, Geomorphology, Lake shores, Sediment transport, Channels, Runoff, Drainage patterns(Geologic), Roads, *Road networks, Upland drainage.

The postglacial drainage of till plains and lake beds by perennial and intermittent streams in southeastern Michigan reveals local adjustments caused by human activity. The present drainage pattern reflects the construction and subsequent maintenance of the local road network. The impact of the road grid on the linear coastal drainage off the Port Huron Moraine's eastern flank was studied from Lexington Heights to Forester, Michigan. Borrow pits supplied the aggregate used to construct bridges and culverts. These facilities restrict flow and reduce transportation of sediment-laden runoff. This results in increased but localized sedimentation. The extension, maintenance, and use of road networks has artificially increased the drainage density of the region by creating additional avenues for surface flow. Road networks also truncate natural drainage channels, forcing the coalescence of the smaller order basins, thereby increasing downcutting and runoff in channels whose natural erosional development would have been much less. Channel reaches whose upland drainage has been pirated experience decreased runoff and exhibit less erosion. Such modern changes in drainage topology pose problems to the reconstruction of historical postglacial drainage patterns, since they result in greater stream drainage density. (Lee-ISWS)

USE OF EXTREME VALUE THEORY IN ESTIMATING FLOOD PEAKS FROM MIXED POPULATIONS,
Utah Water Research Lab., Logan.
R. V. Canfield, D. R. Olsen, R. H. Hawkins, and T. L. Chen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-161052, Price codes: A03 in paper copy, A01 in microfiche. Hydraulics and Hydrology Series UWRL/H-80/01, February 1980. 42 p, 29 Fig, 12 Tab, 8 Append. OWRT-B-173-UTAH(1), 14-34-0001-9100.

Descriptors: *Flood peaks, Flood frequency, Runoff, *Flood forecasting, *Peak discharge, Streamflow, Flood flow, Planning, flood control, Flood plain management, Extreme value theory, Mixed populations, Empirical goodness-of-fit, Fisher-Tippett function, Gumbel distribution, Log-Pearson type III distribution.

A number of extreme-value distributions are examined, and plotting tests are provided for selecting one particularly applicable to flow series composed of the largest flow from each year of record. The generally most appropriate was found to be not the Gumbel distribution, which assumes neither an upper nor a lower bound to the possible flood flows, but rather a form adding a third parameter as an upper bound to the flood flow. The existence of such an upper bound seems reasonable hydrologically, and a maximum likelihood fit of this distribution to 14 stations around the world with over 50 years of record compares favorably with that of the log-Pearson type III distribution. More efficient parameter estimating techniques are, however, needed. The plotting tests for many series were found to exhibit a break between two linear portions suggesting that the recorded flows may in fact be drawn from two or more populations. The form of a distribution of a series drawn as a mixture from two populations is shown theoretically to be multiplicative with respect to the two functions (rather than having the more commonly used additive form). A five parameter distribution was applied to 11 long-term sequences shown by the plotting test to originate from nonhomogeneous sources. The fit was generally excellent.

THE WORTH OF STREAMFLOW DATA IN WATER RESOURCES PLANNING: COMPUTATIONAL RESULTS,
Case Western Reserve Univ., Cleveland, OH.
Y. Y. Haimes, J. A. Craig, and J. Subrahmanian.
Water Resources Research, Vol 15, No 6, p 1335-1342, December 1979. 9 Fig, 11 Tab, 18 Ref, 1 Append. OWRT C-6027(No 5202)(2), 14-31-0001-5202.

Descriptors: *Streamflow, *Water resources, *Data collections, *Model studies, Mathematical models, Data processing, Costs, Planning, Water yield, Rivers, Hydrology, Synthetic hydrology, Methodology, Analytical techniques.

This paper presented computational results for evaluating the worth of streamflow data in water resources planning. Synthetic streamflow was generated with a synthetic streamflow generator, HEC-4 simulation model, where the optimal scheduling and capacity expansion of water supply projects were determined with a dynamic programing model. Penalty matrices associated with high- and low-yield estimates were then developed, using the results from the HEC-4 and the dynamic programing models. A multiobjective op-

timization problem was then formulated, minimizing the expected monetary penalty (in dollars) and the expected water shortage penalty (in million gallons). The solution of the multiobjective optimization problem (by using the surrogate worth trade-off (SWT) method) yielded a Pareto optimal and preferred data collection policy. (Sims-ISWS)

APPLICATION AND ANALYSIS OF A COUPLED SURFACE AND GROUNDWATER MODEL,
Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
A. B. Cunningham, and P. J. Sinclair.
Journal of Hydrology, Vol 43, No 1/4, p 129-148, October 1979. 4 Fig, 4 Tab, 19 Ref. OWRT B-078-NEV(2).

Descriptors: *Streamflow, *Groundwater, *Nevada, *Model studies, Mathematical models, Equations, Channel flow, Streams, Rivers, Open channel flow, Water levels, Groundwater movement, Finite element analysis, Mathematics, Analytical techniques, Hydrology, *Truckee River(NV).

A model which couples two-dimensional, transient, saturated subsurface flow (Boussinesq equation) and one-dimensional, gradually-varied, unsteady, open-channel flow (Saint-Venant equations) was developed and applied to the Truckee River system in norhtern Nevada. The coupled model involved simultaneous numerical solution of the surface and subsurface flow equations using the Galerkin finite-element method. This paper attempted to address questions regarding the application of such a model to both real and hypothetical hydrologic systems in terms of analysis of parameter sensitivity, predictive uncertainty, and uniqueness of model solution. Investigation of parameter sensitivity provides information regarding the relative accuracy with which individual system parameters should be measured in order to insure successful model operation. Model predictive uncertainty was evaluated based on comparison of model output and field observations obtained over a two-year period from the Truckee River study area in northern Nevada. Results indicated fair to good prediction of both high and low river stage and groundwater table elevations with predictive accuracy decreasing with distance away from river channel. A procedure for quantifying uniqueness of model solution was developed to provide insight into the reliability associated with extrapolation of model output beyond the limits of observed field measurements. Based on results for the Truckee River system, such extrapolation appears to be justified. (Sims-ISWS)

EFFECT OF PERIODIC PARAMETERS ON THE AUTOCORRELATION STRUCTURE OF HYDROLOGIC SERIES,
Technical Univ. of Istanbul (Turkey). Dept. of Hydraulic and Water Power.
Z. Sen.
Water Resources Research, Vol 15, No 6, p 1639-1642, December 1979. 1 Fig, 1 Tab, 4 Ref.

Descriptors: *Correlation analysis, *Model studies, *Hydrology, Mathematical models, Time series analysis, Stochastic processes, Rainfall, Runoff, Flow, Streamflow, Evaporation, Analytical techniques, Autocorrelation, Periodic parameters.

The autocorrelation structure of a seasonal hydrologic series was analytically investigated, given a set of periodic parameters such as the means, standard deviations, and seasonal serial correlations between any two seasons. It was observed that periodic means have the most important effect on the correlogram of the seasonal data, whereas the periodicities in the standard deviations and seasonal serial correlations have minor effects which might easily be neglected in the practical hydrological studies of any water resources system design. A STATISTICAL APPROACH TO STATION DISCONTINUANCE,
Princeton Univ., NJ. Dept. of Civil Engineering.
E. F. Wood.
Water Resources Research, Vol 15, No 6, p 1859-1866, December 1979. 9 Fig, 1 Tab, 9 Ref.

Descriptors: *Hydrologic data, *Sampling, *Value, *Decision making, Stations, Statistical methods, Hydrologic aspects, Network design, Probability, Analytical techniques, Floods, Data collections, Statistics, Streamflow, Costs, Variability, Discharge(Water), *Susquehanna River(PA), *Harrisburg(PA), Station discontinuance.

The sequential probability ratio test (SPRT) was developed and applied to the station discontinuance problem. The decision whether to discontinue a station is dependent upon statistical considerations that include the error probabilities of accepting a model when it is incorrect as well as rejecting it when it is correct. Both error probabilities can be explicitly set by using the SPRT approach so that the decision rules are: accept model 1, accept model 2, continue to sample (cannot accept either). The error probability levels are a decision variable that depends upon the use of the data and the cost of collection. Procedures were developed for determining the expected benefits from sampling one additional time within the SPRT framework. The SPRT approach was applied to the Susquehanna River at Harrisburg, Pennsylvania. The results of the analysis show that the Log-Pearson III distribution is statistically superior to three other competing models and that data collection could be ceased after 76 years. The analysis used a probability of error of 0.05. The paper also showed how the cost of sampling can be used in conjunction with SPRT to analyze station discontinuance. (Humphreys-ISWS)

ESTIMATION OF FLOODS OF VARIOUS FREQUENCIES FOR THE SMALL EPHEMERAL STREAMS IN EASTERN WASHINGTON,
Geological Survey, Tacoma, WA. Water Resources Div.
W. L. Haushild.
Geological Survey Water-Resources Investigations 79-81 (open-file report), 1979. 22 p, 6 Fig, 4 Tab, 11 Ref.

Descriptors: *Estimating, *Floods, *Frequency analysis, *Ephemeral streams, *Regional analysis, Analytical techniques, Data collections, Sites, Watersheds(Basins), Equations, Regression analysis, Estimating equations, Streamflow, Drainage area, Peak discharge, Flood forecasting, Flood recurrence interval, Precipitation(Atmospheric), *Eastern Washington.

Equations were developed to estimate the magnitude of floods for various occurrence frequencies at ungaged sites on ephemeral streams that drain small, relatively undeveloped basins in the semiarid part of eastern Washington. The equations were developed from regression analyses that used the logarithms of the longitude indexes of gaged sites, forest cover, and drainage areas of the upstream basins as independent variables and the logarithms of the discharges for selected exceedance-probabilities at the gaged sites were used as dependent variables. These equations may be used to estimate floodflows with probabilities of being exceeded in any year of 50, 20, 10, 4, 2, and 1 percent in natural-flow ephemeral streams that drain relatively undeveloped basins with areas and forest covers less than about 40 square miles and 30 percent, respectively. The standard errors of estimate for the equations range from 57 to 100 percent. Equations that use longitude index as a surrogate for a precipitation index more accurately estimate floods than do equations that use mean annual precipitation, which, in turn, are better than the equations that use the 24-hour precipitation with an exceedance probability of 50 percent. FLOOD HAZARD STUDY -- BERKLEY CREEK AND TRIBUTARIES, HALL COUNTY, TEXAS.
Soil Conservation Service, Temple, TX.
Prepared in cooperation with the Hall-Childress Soil and Water Conservation District Hall County Commissioners Court, City of Memphis and the Texas Department of Water Resources, October 1979. 103 p, 43 Fig, 4 Tab, 12 Ref, 1 Append.

Descriptors: *Flood forecasting, *Texas, *Land use, *Flood data, Flood profiles, Flood peak, Flood frequency, Flood plain zoning, Flood protection, Mapping, Streamflow, Urbanization, Flood recurrence interval, Watersheds(Basins), Ranges.

Areas subject to flooding by Berkley Creek and its major tributaries were identified as a guide to aid in decisions concerning land use and future development in the Memphis, Texas, area. Berkley Creek, located in the northeast part of Hall County, has a total drainage area of 22.5 square miles or 14,400 acres at its confluence with Parker Creek. Average rainfall for the area is about 20.53 inches. Of the land in the watershed 7,214 acres are native rangeland, 5,765 acres are cropland, and 1.421 acres are urban. Involved in the hazard study are 5.5 miles of Berkley Creek, 4.5 miles of Parker Creek, and parts of four tributaries. Approximately 40% of the flood plain is used for agriculture with cotton being the major crop. Approximately 50% of the flood plain is rangeland mostly covered by short and mid grasses. There is some minor flooding every year with serious damage occurring about once every three to five years such as in 1950, 1954, 1955, 1956, 1960, 1973, 1975, 1978, and 1979. A flood in excess of a 500-year event occurred June 2, 1973. Aerial photographs are used to illustrate the limits of 100-year and 500-year frequency floods for the areas studied. Water surface profiles are used to show 10-year, 50-year, 100-year, and 500-year floods for the streams including stream elevation, channel bottom, and bridge and roadway data. Local recommendations and various flood plain management measures are discussed. (Seigler-IPA)

THE 1976-1977 CALIFORNIA DROUGHT--A REVIEW,
California State Dept. of Water Resources, Sacramento.
May 1978. 228 p, 39 Fig, 11 Tab, 58 Illus, 83 Ref, 8 Append.

Descriptors: *Water resources, *Droughts, *Water shortage, *Water storage, *California, *Water supply, Water management(Administrative), Water demand, Hydrologic budget, Rationing(Water), Social aspects, Average runoff, Reservoir storage, Irrigation, Water utilization, Agriculture, Groundwater utilization, Legislation, Water conservation.

This report outlines the serious 1976-1977 drought in California, and includes a description of state and other program responses to the emergency. In

the 1976 water year annual precipitation was only 65% of average. In the 1977 water year, precipitation was even less--45% of average. Runoff to major streams and rivers was reduced to 47% and 22% for 1976 and 1977, respectively. Water storage in major reservoirs dropped during 1976 and 1977, with water storage in 143 major reservoirs dropping to 37% of the average for October 1, 1977, with some reservoirs dropping to as low as 5% of the 10-year average. All 13 state hydrologic regions were affected. Ground water use increased greatly during the period. The responses to the drought included emergency U.S. Department of Interior aid in order to augment community water supplies, to assist in water purchase and transport, and to promote conservation. Further aid came from U.S. Economic Development Administration and the Small Business Administration to aid especially water-dependent small businesses. The California Department of Water Resources established a drought information center, pilot conservation program, emergency loans, and special technical assistance to local governments. During 1978, most reservoirs recovered to normal or near normal stages. Urban area conservation programs are now in effect and are expected to meet future drought emergencies more effectively than did past programs. (Arnold-NC)

MATHEMATICAL MODELLING OF GROUND-WATER FLOW,
G. Kovacs.
Vituki, 1978. 92 p, 31 Fig, 2 Tab, 44 Ref. Published by the Research Centre for Water Resources Development, Budapest (Hungary). Haszpra, O., editor.

Descriptors: *Mathematical models, *Groundwater movement, *Flow, *Porous media, *Hydraulic structures, Analytical techniques, Earth dams, Seepage, Flow characteristics, Model studies, Equations, Mathematics, Potential flow, Flow nets, Finite element analysis, Numerical analysis, Saturated flow, Unsaturated flow, Drawdown, Water table, Aquifers, Piezometry.

The practical problems of seepage to be solved in connection with the design and operation of hydraulic structures (dams, canals, wells, etc.) require the knowledge of the main hydraulic parameters of the water movement developing through the porous medium as a result of pressure difference prevailing between two points or section of the latter. The broad subject areas presented included: (1) general principles concerning the application of mathematical models and numerical methods to kinematic relationships characterizing seepage, and geometrical and kinematic classification of seepage; (2) solution of movement equations with numerical methods for boundary and initial conditions through porous media; (3) practical application of numerical methods for determination of flow nets in the cases of two-dimensional seepage, estimation of the influence of exploitation on groundwater regime, and investigation of multilayered aquifer systems. STOCHASTIC ANALYSIS OF MACRODISPERSION IN A STRATIFIED AQUIFER,
New Mexico Inst. of Mining and Technology, Socorro.
L. W. Gelhar, A. L. Gutjahr, and R. L. Naff.
Water Resources Research, Vol 15, No 6, p 1387-1397, December 1979. 9 Fig, 38 Ref, 4 Append.

Descriptors: *Aquifers, *Groundwater, *Dispersion, *Model studies, Mathematical models, Stochastic processes, Hydraulic conductivity, Stratification, Groundwater movement, Statistics, Statistical models, Mass transfer, Flow, Hydrology, Macrodispersion, Stratified aquifer.

The longitudinal dispersion produced as a result of vertical variations of hydraulic conductivity in a stratified aquifer was analyzed by treating the variability of conductivity and concentration as homogeneous stochastic processes. The mass transport process was described using a first-order approximation which is analogous to that of G.I. Taylor for flow in tubes. The resulting stochastic differential equation describing the concentration field was solved using spectral representations. The results of the analysis demonstrated that for large time the longitudinal dispersivity approaches a constant value which is dependent on statistical properties of the medium. The analysis also described the transient development of the dispersive process and some non-Fickian effects which occur early in the displacement process. (Sims-ISWS)

A PLANNING MODEL FOR THE MANAGEMENT OF GROUNDWATER QUALITY,
Humboldt State Univ., Arcata, CA. Dept. of Environmental Resources Engineering.
R. Willis.
Water Resources Research, Vol 15, No 6, p 1305-1312, December 1979. 2 Fig, 7 Tab, 19 Ref.

Descriptors: *Groundwater, *Water quality, *Management, *Model studies, Mathematical models, Pumping, Injection, Injection wells, Waste disposal wells, Water wells, Hydraulic conductivity, Storage, Aquifers, Finite element analysis, Hydrology.

A dynamic planning model is presented for the optimal management of groundwater quality in regional aquifer systems. The groundwater system was conjunctively managed as a water supply resource and as a storage reservoir for wastewater residuals. The waste-waters were discharged to the groundwater basin through injection wells. Within the groundwater system, constituents were assumed to follow first-order chemical or biochemical reactions and linear equilibrium adsorption. The Galerkin finite element method was used to transform the flow and mass transport equations of the aquifer system into systems of ordinary differential equations which were imbedded as constraint equations in the planning model. The mathematical model, which was structured as a nonconvex programing problem, allows the planner or resource manager to determine (1) the optimal pumping and injection schedules (rates and locations) required to satisfy an exogenous water target and waste load demand and (2) the maximum injection concentrations that can be discharged to the basin without degrading the quality of the aquifer. Operational policies were developed for a 480-day operational cycle for a hypothetical groundwater basin, where it was assumed that groundwater extraction represents the principal resource of the aquifer system. Linear programing was used to identify the optimal planning policies. The important parameters affecting the optimal decisions were discussed. (Sims-ISWS)

DETERMINATION OF RECHARGE RATES USING TEMPERATURE-DEPTH PROFILES IN WELLS,
Environmental Protection Agency, Chicago, IL. Region V.
J. M. Boyle, and Z. A. Saleem.
Water Resources Research, Vol 15, No 6, p 1616-1622, December 1979. 7 Fig, 2 Tab, 38 Ref.

Descriptors: *Groundwater recharge, *Aquifers, *Illinois, *Hydrogeology, *Mathematical models, Recharge, Porous media, Dolomite, Analytical techniques, Analysis, On-site investigations, Water temperature, Heat transfer, Soil temperature, Groundwater movement, Profiles, Leakage, Infiltration, Natural recharge.

Recharge rates to the shallow dolomite aquifer in northeastern Illinois were determined using a theory which describes the simultaneous transfer of heat and fluid in a porous medium. Temperature-depth profiles in a nonpumping well are used to determine vertical groundwater velocities of the downward leakage of water recharging the aquifer which is overlain by semiconfining beds of clay-rich glacial drift. Calculated and observed depths of penetration (19 m) of the annual surface temperature wave, and demonstration of the thermal stability of the well, validate application of the theory, which uses a dimensionless parameter beta to relate curvature in temperature-depth profiles to the magnitude of vertical leakage. Generally, the magnitude of beta decreases as the depth interval L within the aquitard increases. The corresponding decrease in the vertical component of groundwater velocity accompanies a gradual coarsening with depth of the aquitard materials. Temperature differences over time at a given depth within a thermally stable well are found to be within the accuracy of the temperature measuring system. Analysis of variations in beta over time shows that the variability can be due to the limitations of the resolution (0.01C) of the temperature measuring system. Recharge rates determined by analysis of temperature-depth profiles range from 2.47 x 10 to the minus 9th power to 9.86 x 10 to the minus 9th power m/s and agree with estimates resulting from water-budget method. STOCHASTIC ANALYSIS OF STEADY STATE GROUNDWATER FLOW IN A BOUNDED DOMAIN, 2. TWO-DIMENSIONAL SIMULATIONS,
Utah Univ., Salt Lake City. Dept. of Geology and Geophysics.
L. Smith, and R. A. Freeze.
Water Resources Research, Vol 15, No 6, p 1543-1559, December 1979. 14 Fig, 1 Tab, 23 Ref.

Descriptors: *Groundwater, *Groundwater movement, *Stochastic processes, *Model studies, Mathematical models, Hydraulic conductivity, Flow, Aquifers, Boundary processes, Pressure, Hydrology, Analytical techniques, Hydraulic head.

A stochastic analysis of two-dimensional steady state groundwater flow in a bounded domain was carried out by using Monte Carlo techniques. The flow domain was divided into a set of square blocks. A nearest-neighbor stochastic process model was used to generate a multilateral spatial dependence between hydraulic conductivity values in the block system. Both statistically isotropic and statistically anisotropic autocorrelation functions were considered. This model lead to a realistic representation of the spatial variations in hydraulic conductivity in a discrete block medium. Results of the simulations provided estimates of the output distributions in hydraulic head. The probability distribution for hydraulic head must be interpreted in terms of the spatial variation of the expected head gradients, the standard deviation in the hydraulic conductivity distribution, the ratio of the integral scales of the autocorrelation function for conductivity to the distance between boundaries on the flow domain, and the arrangement of statistically homogeneous units within the flow domain. The standard deviation in hydraulic head increases with an increase in either the standard deviation in hydraulic conductivity or the strength of the correlation between neighboring conductivity values. The standard deviations in hydraulic head are approximately halved when a uniform, bounded, two-dimensional flow field is reduced to one-dimensional form. The uncertainties in the predicted hydraulic head values are strongly influenced by the presence of a spatial trend in the mean hydraulic conductivity. In evaluating the concept of an effective conductivity for a heterogeneous medium, both the nature of the spatial heterogene-

ities in hydraulic conductivity and the flow system operating within the flow domain must be considered. (Sims-ISWS)

THERMAL ENERGY STORAGE IN A CONFINED AQUIFER: EXPERIMENTAL RESULTS,
Auburn Univ., AL. Dept. of Civil Engineering.
F. J. Molz, A. D. Parr, P. F. Andersen, V. D. Lucido, and J. C. Warman.
Water Resources Research, Vol 15, No 6, p 1509-1514, December 1979. 12 Fig, 1 Tab, 17 Ref.

Descriptors: *Storage, *Thermal water, *Aquifers, *Groundwater, Hydraulic conductivity, Injection wells, Observation wells, Temperature, Water temperature, Energy, Pumping, Clogging, On-site investigations, Hydrology, Thermal energy storage.

To aid in testing the idea of storing thermal energy in aquifers, an experiment was performed by Auburn University in which 54,784 cu m of water were pumped from a shallow supply aquifer, heated to an average temperature of 55C, and injected into a deeper confined aquifer where the ambient temperature was 20C. After a storage period of 51 days, 55,345 cu m of water were produced from the confined aquifer. Throughout the experiment, which lasted approximately 6 months, groundwater temperatures were recorded at 6 depths in each of 10 observation wells, and hydraulic heads were recorded in 5 observation wells. In order to prevent errors due to thermal convection, most of the observation wells recording temperature had to be backfilled with sand. During the 41-day production period, the temperature of the produced water varied from 55 to 33C, and 65% of the injected thermal energy was recovered. At no time was an appreciable amount of free thermal convection observed in the storage formation. The dominant heat dissipation mechanisms appeared to be hydrodynamic thermal dispersion and possible mixing of cold and hot water induced by clogging and unclogging of the injection-production well. On the basis of laboratory and field studies, it was concluded that clogging of the injection well, which constituted the major technical problem during the experiment, was caused by the freshwater-sensitive nature of the storage aquifer. Due to the relatively low concentration of cations in the supply water, clay particles would swell disperse, and migrate until they became trapped in the relatively small pores connecting the larger pores. Surging the pump and back washing the injection well would dislodge the clogging particles and temporarily improve the storage formation permeability. (Sims-ISWS)

MODELING GROUNDWATER FLOW FIELDS CONTAINING POINT SINGULARITIES: STREAMLINES, TRAVEL TIMES, AND BREAKTHROUGH CURVES,
Stanford Univ., CA. Dept. of Civil Engineering.
R. J. Charbeneau, and R. L. Street.
Water Resources Research, Vol 15, No 6, p 1445-1450, December 1979. 5 Fig, 16 Ref. EPA-R-804431.

Descriptors: *Mathematical models, *Groundwater movement, *Travel time, Equations, Hydraulic properties, Wells, Velocity, Water pollution, Numerical analysis, Artificial recharge, Injection wells, *Streamlines, *Point singularities, *Breakthrough curves, *Transport models, Hydraulic head.

In the work of Charbeneau and Street (1979) a method was presented for modeling steady state groundwater flow fields containing injection and extraction wells. The Galerkin finite element method was used with greatly improved accuracy of the simulation near wells achieved by removing the singular behavior of the flow with an analytic solution for the near-well zone, solving the nonsingular problem, and combining the results. In this paper, methods for exploiting the improved hydraulic head solution were presented. Velocity fields are derived through differentiation of the head solution combined with smoothing and averaging. The velocity fields are used for generating systems of streamlines and determining times of travel to points of interest (including breakthrough curves for a nondispersive contaminant). The method was compared with analytical results for a single injection-extraction well pair. (See also W80-00609) (Visocky-ISWS)

REGIONAL IDENTIFICATION OF SALINE-SEEP RECHARGE AREAS, STILLWATER AND YELLOWSTONE COUNTIES, MONTANA,
Montana State Univ., Bozeman. Dept. of Earth Sciences.
S. G. Custer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-159684, Price codes: A04 in paper copy, A01 in microfiche. Montana Water Resources Research Center, Montana State University Publication No 102, November 1979, 58 p, 9 Fig, 5 Tab, 29 Ref. OWRT A-111-MONT(1), 14-34-0001-9028.

Descriptors: *Saline water, *Groundwater recharge, *Recharge ponds, Soil water movement, Seepage, Land management, Hydrology, Marsh plants, Forage grasses, Specific conductance. *Saline seep, *Recharge area, *Natural recharge, Northern Great Plains, Montana, Stillwater County(Mont), Recharge area identification, *Geologic mapping.

Saline seep causes lost grain production, impassable roads, flooded basements, and stock deaths throughout the Northern Great Plains. The problem can be reduced by flexible cropping in the groundwater recharge area. The recharge area for each saline seep can be identified most efficiently on a regional scale. Saline seep recharge areas were identified in a 600 sq. mi. area in Stillwater and Yellowstone counties, Montana. The area was examined for regional soil and geologic factors which might control the problem. The principal control is the presence of a large internally-drained basin. The surface-water drainage basin contributing to each saline seep coincides with the recharge area for that seep. This relationship exists because the groundwater flow system is shallow and controlled by local topography. Problem areas were clarified by visual observation of plant communities and surface salt; and study of the specific electrical conductance of the water and soil. Communication of the results to the farmers in the area is an important part of the problem solution. The farmers locate themselves using cultural features. The 1:24,000 orthopotograph map base shows the cultural features clearly. The final recharge-area-map overlay includes farmstead names so that the farmer can locate himself easily.

GEOPHYSICAL AND HYDROLOGIC PREDICTION OF FISSURING AND LAND SUBSIDENCE, SOUTH-CENTRAL ARIZONA,
Arizona Univ. Tucson. Dept. of Geosciences.
J. S. Summer, and F. J. Christie.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-159908, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona. Partial Project Completion Report, March 1980. 5 p. OWRT A-073-ARIZ(3), 14-34-0001-7005, 7006 and 8003.

Descriptors: *Land subsidence, *Fissures(Geologic), *Forecasting, Model studies, Geohydrologic units, Bedrock, Arizona, *Gravity exploration, Alluvial basins.

This research was directed toward the understanding of land subsidence, particularly as associated with the occurrence of earth fissures, as found in alluvial basins. The gravity exploration method was employed to survey the Picacho basin area in south-central Arizona where numerous fissures are located and where the land has subsided in excess of 12.5 feet (3.96 m) since 1952. A differential subsidence concept would predict that vertical offset fissures would most likely occur over basement irregularities. Therefore, the gravity data were interpreted in terms of the probable variation in thickness of alluvium overlying the more dense bedrock. Modeling of the bedrock surface under the basin area reveals a strong correlation between gravity gradients and earth fissures. Of earth fissures peripheral to the Picacho basin, 83 percent were correlated to lie with + or - 1/2 mile of a modeled bedrock surface irregularity. Thus it can be concluded that most vertical offset earth fissures are related to bedrock irregularities, and that the gravity method holds promise in predicting the probable occurrence of these features. CONSIDERATION OF TOTAL ENERGY LOSS IN THEORY OF FLOW TO WELLS,
Nevada Univ. System, Reno. Water Resources Center.
R. L. Cooley, and A. B. Cunningham.
Journal of Hydrology, Vol 43, No 1/4, p 161-184, October 1979. 7 Fig, 1 Tab, 18 Ref, 1 Append. OWRT A-061-NEV(2), 14-31-0001-5028.

Descriptors: *Groundwater, *Water wells, *Model studies, Mathematical models, Groundwater movement, Drawdown, Pumping, Porous media, Aquifers, Aquitards, Equations, Finite element analysis, Hydraulic conductivity, Hydrology.

A coupled numerical solution was developed for unsteady flow in single or multiple confined or semiconfined aquifers and in the well penetrating the system. Analysis of hypothetical problems indicated that, because of friction losses and nonuniform flow in the well bore, a significant region of nonradial flow in the aquifer(s) results whenever aquifer hydraulic conductivity is greater than about 0.015 m/min and pumping rate is greater than about 1.2 cu m/min. Because of this nonradial flow, use of standard aquifer testing equations can lead to significant errors in computed aquifer transmissivity whenever aquifer hydraulic conductivity is greater than about 0.03 m/min. Because of unsteady flow in the well bore, flow may be highly nonradial for the first few seconds of pumping irrespective of hydraulic conductivity or pumping rate. Percentage of open area in the screened or perforated section of well bore, Fanning friction factor, and contraction coefficients characterizing flow through the perforations or slots are parameters that could cause large head losses in the well in some cases. Expressions for parameters B and C in the total drawdown equation s sub w = BQ + CQ to the 2 power (where s sub w is drawdown in the well and Q is pumping rate) were developed dimensionally from expressions used in this study. The development shows that both B and C could theoretically be dependent on Q. (Sims-ISWS)

DUMANLI SPRING, TURKEY--THE LARGEST KARSTIC SPRING IN THE WORLD,
J. Karanjac, and G. Gunay.
Journal of Hydrology, Vol 45, No 3/4, p 219-231, February 1980. 5 Fig, 4 Ref.

Descriptors: *Springs, *Discharge(Water), *River flow, *Fluorescent dye, *Rhodamine, Tracers, Reservoir sites, Pre-impoundment, Karst, Base flow, Recession curves, Hydrographs, Limestones, Submergence, Aquifers, *Turkey.

The enormous Dumanli spring in the Mediterranean region of Turkey will be submerged by the

year 1982 by about 120 m head produced by the Oymapinar Reservoir. The spring contributes one-third to the annual discharge of the Manavgat River, which will be dammed at Oymapinar. The mean discharge of the spring is estimated at about 50 cu m/s; thus its total annual outflow is about 1.6 x 10 to the 9th power cu m. In October 1978 the authors measured the spring discharge by the dye-dilution technique. The flow rate of about 35.6 cu m/s at the very end of the dry period (at the end of the spring's discharge recession) motivated the authors to declare the Dumanli the largest karstic spring in the world, issuing from one single orifice. The results of the dye-dilution technique applied in this experiment were compared with staff-gage readings upstream and downstream of the Dumanli spring. To the best of the authors' knowledge this is the first reported dye-dilution experiment that accurately measured the discharge of a river with an annual flow of about 50 cu m/s. (Visocky-ISWS)

WATER RESOURCES OF THE LOWER ELWHA INDIAN RESERVATION, WASHINGTON,
Geological Survey, Tacoma, WA. Water Resources Div.
K. L. Walters, W. L. Haushild, and L. M. Nelson.
Geological Survey Water-Resources Investigations 79-82 (open-file report), 1979. 54 p, 14 Fig, 6 Tab, 12 Ref.

Descriptors: *Groundwater resources, *Indian reservations, *Available water, *Potential water supply, Fish hatcheries, Hydrogeology, Data collections, Sites, Climatic data, Hydrologic data, Hydrologic cycle, Water wells, Logging(Recording), Water-level fluctuations, Aquifers, Flow characteristics, Water quality, Surface waters, Groundwater, Flooding, Water temperature, Washington, *Lower Elwha Indian Reservation(Wash), Clallam County(Wash), Elwha River(Wash).

The Lower Elwha Indian Reservation covers 372 acres at the mouth of the Elwha River in Clallam County, Washington. The land of the reservation is used principally for residential purposes and growing forage for cattle. The population of the reservation is largely dependent upon fisheries resources for its economic health. This study was made to assess the availability and suitability of ground water on the reservation for domestic use and for fish propagation, to determine the streamflow characteristics of the Elwha River and Bosco Creek, and to determine the chemical and physical quality of the area's surface and ground waters. Existing wells on the reservation range in depth from about 30 to about 80 feet, and produce water of excellent chemical quality. Properly constructed wells in favorable locations on the reservation should be capable of large yields up to 5,000 gallons per minute. Intrusion of seawater into the aquifers of the reservation has not occurred. However, if massive quantities of ground water are withdrawn, intrusion could occur. The Elwha River, which flows along the western margin of the reservation has a mean annual flow of about 1,500 cubic feet per second (cu ft/s). The recorded minimum daily discharge was 10 cu ft/s, and the maximum was 41,600 cu ft/s. The river floods the lower parts of the reservation annually, and extensive flooding is common. Water in the Elwha River is of excellent chemical quality, and its recorded temperature has ranged from 36F to 64F. Bosco Creek, the only other stream on or adjacent to the reservation, has an estimated mean annual flow of 1.1 cu ft/s. (Kosco-USGS)

GROUND-WATER RESOURCES IN THE METROPOLITAN REGION OF NASHVILLE, TENNESSEE,
Geological Survey, Nashville, TN. Water Resources Div.
D. R. Rima, and P. L. Goddard.
Geological Survey report, 1979. 44 p, 6 Fig, 2 Plates, 6 Tab, 16 Ref. (Prepared in cooperation with U.S. Army Corps of Engineers, Nashville District).

Descriptors: *Groundwater resources, *Tennessee, *Groundwater availability, *Water resources development, *Water quality, Geomorphology, Hydrologic cycle, Hydrologic data, Water wells, Water analysis, Water yield, Aquifer characteristics, Limestones, Bedrock, Karst, Regolith, Subsurface flow, *North-central Tennessee, *Nashville(Tenn).

The availability of ground-water in a 10-county area in north-central Tennessee surrounding Nashville is reported. The Central Basin and Highland Rim physiographic regions equally comprise the study area. Records of wells and springs were analyzed to derive relationships between the availability of large ground-water supplies and maps depicting geologic and topographic features. In the Central Basin, significant features include the following: (1) depressions in bedrock structure; (2) low, flat areas; and (3) delineations of tops of four major aquifers. Significant features in the Highland Rim include the following: (1) regolith at least 60 feet thick; (2) depressions in bedrock structure; and (3) low, flat areas. The significant features in each region were used to prepare maps delineating areas of high, moderate, and low potential for the development of ground-water supplies. Large groundwater supplies are available in most of the study area. Yields of successful wells may range from 100 to 250 gallons per minute. (Kosco-USGS)

HYDROLOGIC DATA FROM SELECTED WELLS IN THE HELENA VALLEY, LEWIS AND CLARK COUNTY, MONTANA,
Geological Survey, Helena, MT. Water Resources Div.
J. A. Moreland, R. B. Leonard, T. E. Reed, R. O. Clausen, and W. A. Wood.
Geological Survey open-file report 79-1676, November 1979. 54 p, 18 Fig, 1 Plate, 4 Tab.

Descriptors: *Hydrologic data, *Water wells, *Montana, *Data collections, *Groundwater, Aquifer testing, Test wells, Drawdown, Pumping, Observation wells, Water level fluctuations, Measurement, Water quality, Water analysis, Water temperature, Chemical analysis, Irrigation, Maps, *Helena Valley(Mont), *Lewis and Clark County(Mont).

Hydrologic data were collected during 1978-79 to aid in evaluating the hydrologic conditions in shallow aquifers beneath the Helena Valley, Montana. The locations of 52 shallow test wells augered during the study are shown on a map at a scale of 1:48,000. Periodic water-level measurements and water-quality analyses for the test holes are listed in tables. Water temperature, specific conductance, and nitrate concentration are given for water samples collected from 98 domestic wells, and chemical analyses are included for 11 domestic and irrigation wells. In addition, water-level drawdown and recovery data are plotted on graphs for five pumped wells and three observation wells. (Kosco-USGS)

GROUNDWATER IN THE UNITED STATES 1975-78,
Geological Survey, Lawrence, KS. Water Resources Div.
J. S. Rosenshein.
Review of Geophysics and Space Physics, Vol 17, No 6, p 1240-1253, September 1979. 354 Ref.

Descriptors: *Groundwater, *United States, *Water resources development, *Water quality, *Groundwater resources, Aquifer systems, Droughts, Evaluation, Surface waters, Conjunctive use, Saline water intrusion, Waste disposal, Water management(Applied), Pumping, Subsidence, Chemical analysis, Reclaimed water.

Interest in groundwater has been at a high level from 1975 to 1978. The study of environmental problems caused greater interest in the relation of groundwater to energy and resources development, water-quality surveillance, and the legal and economic significance of depleting aquifer systems during extended droughts. Increased interest has been shown by creation and implementation of the National Water Data Exchange, the Safe Drinking Water Act requirements, summary appraisals of groundwater regions, Regional Aquifer-System Analyses, State-Federal Water Use Data Base, and numerous water-management districts. Research in groundwater systems included quantitative and qualitative evaluation for planning and management, conjunctive use of ground and surface water, land- and water-use management, contamination by saltwater and waste disposal, subsidence related to pumping or dissolution of salt beds, and the chemical and biochemical effects of reclaiming waste water. Analytical models were used to solve problems in two- and three-dimensional flow, confined and unconfined systems, transient and steady-state conditions, saturated and unsaturated flow, and estimation of aquifer parameters. GEOLOGY AND GROUNDWATER RESOURCES OF MONROE COUNTY, PENNSYLVANIA,
Geological Survey, Harrisburg, PA. Water Resources Div.
L. D. Carswell, and O. B. Lloyd, Jr.
Pennsylvania Geological Survey, Fourth Series, Water Resources Report 47, 1979. 61 p, 7 Fig, 1 Plate, 12 Tab, 46 Ref, Append.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Groundwater availability, *Water quality, Water wells, Water yield, Water level fluctuations, Pumping, Surface-groundwater relationships, Groundwater recharge, Water analysis, Chemical analysis, Pennsylvania, *Monroe County(PA).

Monroe County is on the eastern border of Pennsylvania, where average annual recharge to and discharge from the ground-water reservoir is about 17 inches. Recharge circulates to a depth of more than 800 feet, but 85 percent of the circulation in above 400 feet. Glacial deposits and the underlying clastic and carbonate rocks comprise the groundwater reservoir, which stores about one trillion gallons of freshwater. One of every four wells located, constructed, and developed for large yields can, on the average, produce 400 gal/min from coarse glacial deposits; more than 200 gal/min from the Bloomsburg Formation, Poplar Gap Member of the Catskill Formation, and the carbonates; about 100 gal/min or more from the noncarbonates of the Silurian-Devonian undivided unit, the Marcellus, and the Trimmers Rock Formations; and less than 100 gal/min from the Mahantango Formation and the other members of the Catskill Formation. ANALYSIS OF CHANGES IN GROUNDWATER LEVELS IN A SEWERED AND AN UNSEWERED AREA OF NASSAU COUNTY, LONG ISLAND, NEW YORK,
Geological Survey, Syosset, NY. Water Resources Div.
D. J. Sulam.
Ground Water, Vol 17, No 5, p 446-455, September-October 1979. 7 Fig, 4 Tab, 10 Ref.

Descriptors: *Mass curves, *Groundwater, *Water level fluctuations, *Sewerage, *New York, Drawdown, Pumping, Sewers, Cesspools, Septic tanks, Groundwater movement, Hydrographs, *Long Island(NY), Water level declines.

From the 1950's to the early 1970's, expansion of sanitary sewerage in southwest Nassau County, Long Island, N.Y., contributed to progressive declines in ground-water levels. Since the early 1970's however, 10 years after the area was fully

sewered, water levels have not declined significantly, which suggests that the water table may have reached a new equilibrium position. Double-mass-curve analyses show that during 1953-76 the average weighted ground-water levels in a 32-square-mile part of the sewered area declined 12.2 feet more than those in the unsewered area to the east. However, by 1973 this decline was 13.5 feet. Finite-difference digital-model results indicate that 3.6 feet of the relative 1953-76 decline was due to pumping in adjacent Queens County and that most of the remaining decline was a result of sewerage. Streamflow within the sewered area decreased in response to the lowered ground-water levels, and ground-water levels in the adjacent unsewered area were also lowered because of the sewerage. Descriptors: *Idaho, *Base flow, *Groundwater, *Phosphates, *Water pollution sources, Subsurface flow, Hydrogeology, Hydrologic aspects, Aquifer characteristics, Waste disposal, Mathematical models, Environmental effects, Topography, Mining.

Hydrologic and mining related variables were identified and their interaction evaluated to promote effective resource development balanced with conservation management in the Western Phosphate Field located in Idaho, Utah, Wyoming, and Montana. Several phases were involved in the study: the delineation of hydrologic and mining related variables, data collection and analysis from selected sites in Idaho, and the construction of models showing variable interaction. Various groups of environmental factors interacting to shape the water resource systems in the area include: geologic, topographic, hydrologic, climatic, chemical, and biotic. Two mining activities, open pits and waste piles, were found to have the largest potential for affecting water resource systems. A study of stream gains and losses and the locations of springs confirmed a pattern of hydrogeologic characteristics, the 'phosphate sequence', which occurs throughout the area involving groundwater flow in the Dinwoody, Phosphoria, and Wells formations. Two mine areas were studied in detail to obtain additional hydrogeologic insight on flow patterns. Another study showed that chemical leaching and acid production from phosphate waste piles is not a problem. Conceptual models of water resource systems were developed from the theoretical patterns of groundwater flow. The models were used to classify potential mine sites and can be used to evaluate mining impacts on the water resource systems and the hydrologic limitations to mining. A predictive steady state model of the upper Blackfoot River basin was also developed. (Seigler-IPA)

2G. Water In Soils

FIELD MEASUREMENT OF SOIL HYDRAULIC PROPERTIES CHARACTERIZING WATER MOVEMENT THROUGH SWELLING CLAY SOILS,
Soil Survey Inst., Wageningen (Netherlands).
J. Bouma.
Journal of Hydrology, Vol 45, No 1/2, p 149-158, January 1980. 8 Fig, 14 Ref.

Descriptors: *Soil water movement, *Hydraulic properties, *Infiltration, *Expansive clays, Soil properties, Clays, Porous media, Heterogeneity, Cracks, Permeability, *Field measurements, Sampling techniques.

Determination of hydraulic properties in swelling clay soils is difficult due to seasonal variations in pore geometry and to soil structural heterogeneity, requiring large samples. Large in situ columns are therefore prepared to measure K sub sat and K sub unsat near saturation, using the crust test. Soil structure descriptions can be used to estimate optimal sample size. Infiltration into dry or moist clay soil with vertically continuous cracks involves preferential vertical movement of water along the cracks. The resulting irregular moisture distribution does not allow use of many common soil physical techniques, which require homogeneous moisture contents in isotropic soil. (Adams-ISWS)

ANALYTICAL SOLUTIONS FOR PREDICTING SOLUTE MOVEMENT AND THEIR INTERPRETATION IN RECLAMATION,
Central Soil Salinity Research Inst., Karnal (India).
S. K. Gupta, and S. R. Singh.
Journal of Hydrology, Vol 45, No 1/2, p 133-148, January 1980. 6 Fig, 1 Tab, 19 Ref.

Descriptors: *Leaching, *Saline soils, *Model studies, Mathematical models, Equations, Soil water, Soil water movement, Solutes, Salts, Dispersion, Soils, Reclamation, Soil science, Solute movement.

Analytical solutions to the dispersion-convection equation for leaching of saline soils under exponentially decreasing and arbitrary initial salt profile were presented. The soil profile was considered semi-infinite and homogeneous. Another solution incorporating and exponentially decreasing time-varying boundary condition at the surface was developed. The effect of the initial condition and solute transport parameters on the predictive behavior of the model was studied by arbitrarily choosing values of the parameters. The results indicated that the prediction accuracy of the model increases if the initial salt distribution profile is represented by a function which approximates this profile closely. The effect of the time-varying boundary condition is negligible for most practical purposes at or below 15 cm depth of the soil profile. The changes in the transport parameter may not only enhance or retard the pace of reclamation but also affect the final salt distribution in the soil profile. (Sims-ISWS)

CALCULATION OF WATER BALANCE IN THE CROP ROOT ZONE BY COMPUTER,
Indian Agricultural Research Inst., New Delhi. Water Technology Centre.
P. B. S. Sarma, N. H. Rao, and K. V. P. Rao.
Journal of Hydrology, Vol 45, No 1/2, p 123-131, January 1980. 5 Fig, 2 Ref, 1 Append.

Descriptors: *Water balance, *Root zone, *Model studies, Computer models, Mathematical models, Soil water, Soil moisture, Evaporation, Evapotranspiration, Rainfall, Irrigation, Subsurface drainage, Infiltration, Soil water movement, Storage, Computer programs, Computers, Soil science.

A computer program was developed that computes the daily evapotranspiration as a residue from the water balance equation. Moisture profiles from field observations of soil moisture tensions are used as an input into the model. Further, the program evaluates the effects of rainfall or irrigation during the periods of observation and also calculates the water loss from deep drainage. It takes care of the limitation in the availability of data due to occasional skipping of records for two or more days at a stretch. The additional features of this program include the procedures for the computation of infiltration and the moisture flow. The model was applied to actual field data, and the results were presented. SOIL SPATIAL VARIABILITY AND ITS CONSEQUENCES ON SIMULATED WATER BALANCE,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Land Resources Management.
M. L. Sharma, and R. J. Luxmoore.
Water Resources Research, Vol 15, No 6, p 1567-1573, December 1979. 6 Fig, 2 Tab, 20 Ref. DOE W-7405-eng-26.

Descriptors: *Soil properties, *Spatial distribution, *Water balance, *Model studies, Mathematical models, Hydraulic properties, Soils, Evapotranspiration, Vegetation, Vegetation effects, Runoff, Surface runoff, Subsurface runoff, Drainage, Precipitation(Atmospheric), Soil water, Groundwater, Storage, Watersheds(Basins), Hydrology.

Scaling theory, based on the similar media concept, provides a basis for representing soil spatial variability in terms of a single stochastic variable, the scaling factor alpha which is related to the microscopic characteristic length of the soil. Based on the measured properties of alpha (log normally distributed with an arithmetic mean of 1.0 and coefficient of variation of 0.6), the effects of soil spatial variability on the water balance components of a grassland watershed near Chickasha, Oklahoma, were studied by using a simulation model. Monthly simulations of evapotranspiration, surface runoff, deep drainage, and change in soil water storage for the year 1973 were computed for several values of alpha, representing soils with widely ranging hydraulic properties. At any time, vegetation and meteorological parameters were the same for all the soils. Our studies revealed the complexities of soil-plant-atmospheric interactions in evaluating the influence of soil variability on water balance and underlined the limitations of drawing generalizations. The conclusions were highly dependent on the extent of variability (coefficient of variation of alpha), the frequency distribution function of the scaling factor, and the soil-plant-weather combination. MEASUREMENT AND NUMERICAL SIMULATION OF HYSTERETIC FLOW IN A HETEROGENEOUS POROUS MEDIUM,
Waterloo Univ., (Ontario). Dept. of Earth Sciences.
R. W. Gillham, A. Klute, and D. F. Heermann.
Soil Science Society of America Journal, Vol 43, No 6, p 1061-1067, November-December 1979. 10 Fig, 2 Tab, 20 Ref. OWRT A-014-COLO(4).

Descriptors: *Mathematical models, *Hysteresis, *Porous media, *Numerical analysis, *Heterogeneity, Hydraulic conductivity, Pressure head, Moisture content, Laboratory tests, Sands, Equations, Equipment, Richards equation, Sand column.

A finite difference solution of the Richards equation was tested experimentally for hysteretic flow in a nonuniform medium. The space-dependent hydraulic properties (water content-pressure head and hydraulic conductivity-water content) were determined experimentally on a laboratory column of sand and were represented in the numerical model by empirical equations. Boundary conditions resulting in hysteretic flow were applied to both the experimental column and the numerical model, and the resulting water content and pressure head profiles were compared. Agreement was excellent between the measured and computed results. An additional simulation, in which the medium was considered to be nonhysteretic, gave good agreement between the measured and computed pressure head values but resulted in substantial error in the computed water content values. THE APPLICATION OF THE GAMMA NEUTRON METHOD FOR TRANSPORT STUDIES IN FIELD SOILS,
CEA Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-Les-Durance (France). Dept. de Biologie.
P. Couchat, P. Moutonnet, M. Puard, and F. Brissaud.
Water Resources Research, Vol 15, No 6, p 1583-1588, December 1979. 11 Fig, 3 Tab, 10 Ref.

Descriptors: *Nuclear moisture meters, *Soil water movement, *Tracers, *Deuterium, Equipment, Instrumentation, Laboratory tests, Gamma rays, On-site investigations, Moisture content, Soils, Soil moisture, Pore water, Soil science.

In order to study water movement in the field, deuterated water was monitored by the gamma neutron method, using 208T1 gamma source and 3He thermal neutron detector. A laboratory device was presented which supplies measurement data on a 5-ml soil solution. The performance of a gamma neutron probe was evaluated, the background count rate which depends on soil moisture content was related to the neutron emission of 208T1 gamma source, the resolution was found to depend on gamma diffusion and was no more than 15 cm in unsaturated soil, and the calibration was given vs. volumetric deuterated water content. The dispersive transport of a D20 pulse on a soil column was studied through a D20 concentration profile and breakthrough curve at the bottom of the column. Then simultaneous measurements of soil water content and D20 concentration by the neutron moisture gage and the gamma neutron probe enabled the authors to interpret the evolution of the D20 pulses as a function of irrigation during a field experiment. ESTIMATING SOIL WATER RETENTION CHARACTERISTICS FROM PARTICLE SIZE DISTRIBUTION, ORGANIC MATTER PERCENT, AND BULK DENSITY,
Science and Education Administration, St. Paul, MN. Soil and Water Management Research Unit.
S. C. Gupta, and W. E. Larson.
Water Resources Research, Vol 15, No 6, p 1633-1635, December 1979. 3 Fig, 2 Tab, 14 Ref.

Descriptors: *Soil water, *Regression analysis, *Particle size, *Organic matter, *Retention, *Bulk density, Statistical models, Equations, Curves, Soil water movement, Soils, Soil-water-plant relationships, Sands, Silts, Clays, Soil water retention.

Regression models were presented for estimating soil-water-retention curves from particle-size distribution, percentage of organic matter, and bulk density. Models were developed from the measured soil-water-retention curves of artificially packed cores (7.6 x 7.6 cm) of 43 soil materials. These soil materials included 13 agricultural soils. Curves predicted with these models approximated reasonably well the measured water retention of 61 Missouri soils. Because conventional methods of obtaining retention curves are expensive and time consuming, these equations will be valuable for modeling salt and water flow in soils and for estimating available water capacities. SPATIAL VARIABILITY OF INFILTRATION IN A WATERSHED,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Land Resources Management.
M. L. Sharma, G. A. Gander, and C. G. Hunt.
Journal of Hydrology, Vol 45, No 1/2, p 101-122, January 1980. 13 Fig, 3 Tab, 34 Ref.

Descriptors: *Infiltration, *Correlation analysis, *Heterogeneity, *Watersheds(Basins), *Oklahoma, Analysis, Porous media, Soil properties, Soil physics, Infiltrometers, Unsteady flow, Statistical methods, Loam, *Philip's equation, *Silt loam soils, Field experiments, Log-normal distributions.

Twenty-six infiltration tests were carried out on a 9.6-ha watershed, near Chickasha, Oklahoma. The data from each test were expressed in the form of Philip's two-parameter equation. In most cases this equation could be adequately matched to the data so that the variability of infiltration in the watershed could be expressed in terms of the two parameters, S and A. There was no obvious pattern in the distribution of infiltration parameters with respect to soil type or position in the watershed. Due to large variability within soil units of the watershed, delineation of hydrologically homogeneous zones is not warranted. The range of values of S over the watershed was within an order of magnitude, while that of A was within two orders of magnitude. Parameters S and A were correlated (r = 0.81). The frequency distributions were better approximated by log-normal than by normal distributions. However, assuming a normal distribution for S would not introduce as much error as it would for A. The infiltration data from 26 sites, comprising 618 observations, were scaled according to the concept of similar media, and one value of scaling factor was assigned to the infiltration data of each site. Scaling factors alpha sub S and alpha sub A were computed from the independently determined parameters, S and A. The reduction in error sums of squares of the scaled data was much greater with alpha sub A than with alpha sub S, although the scaling theory states that these factors should be identical. Remarkable improvement in scaling was achieved when the geometric or the harmonic means were used. Results based on the harmonic mean of alpha sub SA were almost identical to those calculated by statistical optimization. The frequency distribution of scaling factors in the watershed was log-normal. (Adams-ISWS)

PHOSPHORUS DYNAMICS IN A PIEDMONT RESERVOIR,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
L. Greer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-156235, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, 1979, 85 p, 14 Fig, 16 Tab. OWRT-A-102-NC(1), 14-34-0001-9035.

Descriptors: *Phosphorus, Phosphorus uptake, Lake stratification, Nutrients, Turnovers, Bacterial uptake, *Reservoirs, Algae, Bacteria, Suspended solids, Lakes, North Carolina, *University Lake(NC), Piedmont, Phosphorus concentration, *Lake nutrients.

A North Carolina Piedmont lake was monitored for physical and chemical characteristics. Interest focused on phosphorus (P) and nitrogen concentrations, and phosphorus uptake by algae, bacteria and suspended sediments. Results indicate that phosphate concentrations from 0.006 mg/l to 0.045 mg/l constituted half and one quarter of the total P in winter and spring, respectively. Bacterial uptake exceeded algal uptake of P at all depths and on all occasions except June. Suspended sediment did not compete favorably with the 2 biotic components and contributed significantly to the uptake of P only during the winter. (DiNardi-NC)

TURBIDITY-INDUCED MEROMIXIS IN AN OREGON RESERVOIR: HYPOTHESIS,
Army Engineer District, Portland, OR. Hydrology Section.
D. W. Larson.
Water Resources Research, Vol 15, No 6, p 1560-1566, December 1979. 6 Fig, 1 Tab, 17 Ref, 1 Append.

Descriptors: *Reservoirs, *Meromixis, *Turbidity, *Oregon, Stratification, Water temperature, Suspended solids, Sediments, Lakes, Limnology, *Hills Creek Reservoir(OR).

Flood flows into a river impoundment early in its history are believed to have produced a deep-water layer of highly turbid water that persisted owing to the slow settling of suspended material and poor reservoir flushing ability. Subsequent inflows of considerably cleaner water, superimposed on the turbid layer, created a pronounced mid-depth density gradient. Possibly, circulation of water between the two layers was restricted for several years, and a condition regarded as meromictic may have been established. (Sims-ISWS)

CLIMATOLOGICAL ESTIMATE OF THE AVERAGE MONTHLY ENERGY AND WATER BUDGETS OF LAKE TAHOE, CALIFORNIA-NEVADA,
California Univ., Davis. Dept. of Land, Air and Water Resources.
L. O. Myrup, T. M. Powell, D. A. Godden, and C. R. Goldman.
Water Resources Research, Vol 15, No 6, p 1499-1508, December 1979. 11 Fig, 4 Tab, 35 Ref. NSF AEN 22675, NSF DES 75-14375, NSF GA-34099.

Descriptors: *Lakes, *Hydrologic budget, *Energy budget, *California, *Nevada, Water temperature, Air temperature, Meteorological data, Hydrologic data, Runoff, Precipitation(Atmospheric), Discharge(Water), Evaporation, Analytical techniques, Monthly, Analysis, Mathematical models, Lake Tahoe, Limnological data.

An estimate of the average monthly energy and water budgets of Lake Tahoe, California-Nevada, was made from commonly available meteorological, hydrological, and limnological data. The water budget indicates that precipitation, discharge, runoff, and evaporation dominate the water balance in seasonal succession, each associated with an appropriate minimum or maximum in the lake water storage. The annual energy budget is dominated by the net radiation and evaporation terms with 93% of the radiation input used to evaporate water. The seasonal energy budget indicates that (1) energy storage is in phase with the radiation input and is a dominant term in the periods November-January and May-July, (2) evaporation reaches a maximum value in the fall, 3 months after the radiation maximum, (3) upward transfer of sensible heat from the lake surface reaches a maximum another 3 months later, in the winter, and (4) the sensible heat flux is downward in late spring and early summer, indicating stable stratification in the atmospheric surface layer over the lake during this period, a result of possible significance to air quality in the Tahoe basin. The energy storage and sensible heat transfer terms show large fluctuations in the fall which may be associated with large-scale meteorological events during a season in which energy is trapped in the surface waters by stable stratification in the thermocline layer. USE OF HYPOLIMNETIC OXYGEN DEPLETION RATE AS A TROPHIC STATE INDEX FOR LAKES,
Meta Systems, Inc., Cambridge, MA.
W. W. Walker, Jr.
Water Resources Research, Vol 15, No 6, p 1463-1470, December 1979. 11 Fig, 3 Tab, 24 Ref.

Descriptors: *Lakes, *Water quality, *Dissolved oxygen, *Indicators, Hypolimnion, Trophic level, Eutrophication, Phosphorus, Chlorophyll, Turbidity, Nutrients, Oxygen, Data processing, Analytical techniques, Limnology.

The feasibility of lake water quality management planning has been greatly increased over the past 10 years with the development of relatively simple, empirical methods for assessing eutrophication problems. These relate phosphorus loading, hydrology, and morphometry to such traditional tro-

phic state indices as phosphorus concentration, chlorophyll-a concentration, and transparency. One of the difficulties associated with use of these methods is that water quality criteria, as related to beneficial use, do not generally correspond to subjective definitions of 'trophic state.' This paper attempted to improve upon existing methods by relating measures of phosphorus, chlorophyll-a, and/or transparency to hypolimnetic dissolved oxygen, which is of direct relevance to existing water quality standards, particularly for fisheries management. A modified version of Carlson's trophic state index summarized relationships among summer, epilimnetic measurements of total phosphorus, chlorophyll-a, and transparency. On the basis of data from 30 lakes this index was shown to be highly correlated with areal hypolimnetic oxygen depletion rate when the apparent effects of mean depth were also taken into account (R sq = 0.91). Tests of the empirical model on a separate data base of 86 lakes indicated that the approach can be used to predict oxygen status based upon lake morphometry and trophic index. The methodology provided a link between phosphorus mass balance models and existing water quality criteria for dissolved oxygen. (Sims-ISWS)

ICHTHYOPLANKTON OF THE ST. LAWRENCE ESTUARY: COMPOSITION, DISTRIBUTION, AND ABUNDANCE,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Zoology.
K. W. Able.
Journal of the Fisheries Research Board of Canada, Vol 35, No 12, p 1518-1531, December 1978. 13 Fig, 6 Tab, 45 Ref.

Descriptors: *St Lawrence estuary(Canada), *Distribution, *Biomass, *Fish eggs, Plankton, Larvae, Larval growth stage, Fish, Fish establishment, Osmerids, Gadids, Cottids, Cyclopterids, Pleuronectids, Smelts, Spawning, Speciation, Systematics, Spatial distribution, Seasonal, Baseline studies, Canada.

Ichthyoplankton composition, distribution and abundance in the St. Lawrence estuary, including the adjacent Saguenay River and the northwest Gulf of St. Lawrence, were investigated June-July 1973, June-October 1974, and May-September 1975. Estuarine ichthyoplankton are relatively depauperate. Eggs and larvae of 25 species from 14 families were collected; gadid, cottid, cyclopterid and pleuronectid families had the most species. Most abundant larvae were osmerids, capelin (Mallotus villosus) and rainbow smelt (Osmerus mordax), which together made up 91.2%, 87.9% and 98.8% respectively of total larvae collected 1973-1975. Larvae were dominated by species with demersal eggs. Pelagic eggs occurred; however, these were usually from nonresident species. During all 1975 sampling periods, larvae were consistently more abundant in the upper than lower estuary. Larval abundance varied 1.4-860.3 individuals/100 cu m in the upper estuary compared with 0.1-1.0 individuals/100 cu m in the lower estuary. Greater larval abundance in the upper estuary is due to its use as a major spawning (M. villosus, Clupea harengus harengus) and nursery area (C. harengus harengus, O. mordax, Microgadus tomcod). Pelagic eggs and fish larvae are most abundant late May to early June with 99.4% of all larvae taken in early June. (Danovich-Wisconsin)

ON THE PROBLEM OF DISCRETIZATION IN DAM THEORY,
Caulfield Inst. of Tech., Victoria (Australia).
P. Lochert, and R. M. Phatarfod.
Water Resources Research, Vol 15, No 6, p 1593-1597, December 1979. 2 Fig, 1 Tab, 11 Ref.

Descriptors: *Reservoirs, *Reservoir operation, *Model studies, Mathematical models, Markov processes, Dams, Reservoir releases, Reservoir storage, Inflow, Discharge(Water), Theoretical analysis, Analytical techniques, Probability, Water resources, Discretization, Erlangian inputs, Reservoir theory.

This paper considered the twin problems of the nature of discretization and the size of the unit of discretization in reservoir theory. It compared the probabilities of emptiness and of fullness of the reservoir obtained by the discretization schemes suggested by Moran and Doran. It was proved that the probability of emptiness for the former scheme is always greater than that obtained for the latter scheme. The probability distribution of the reservoir content for the latter scheme was derived for the case when the release is the unit of measurement. Finally, the probabilities of emptiness and of fullness of the reservoir for the two schemes were compared with the exact values for the Erlangian input case. (Sims-ISWS)

THE LINEAR RESERVOIR WITH MARKOVIAN INFLOWS,
Ain Shams Univ., Cairo (Egypt).
A. A. Anis, E. H. Lloyd, and S. D. Saleem.
Water Resources Research, Vol 15, No 6, p 1623-1627, December 1979. 1 Fig, 1 Tab, 27 Ref.

Descriptors: *Reservoirs, *Inflow, *Discharge(Water), *Model studies, Mathematical models, Markov processes, Stochastic processes, Probability, Storage, Theoretical analysis, Analytical techniques, Hydrology, Reservoir theory.

The purpose was to derive the outflow distribution from a linear reservoir fed by a discrete-time gamma-distributed Markovian inflow. A satisfactory continuous time solution was available for the linear reservoir when the inflow distribution has independent increments. For the case of nonindependent increments discussed in the paper the treatment is in terms of a gamma-distributed Markov chain inflow process in discrete time, for which the Laplace transform of the outflow rate distribution was derived. This was inverted, numerically, for a set of typical parameter values. (Sims-ISWS)

A NOTE ON ERROR ANALYSIS FOR A PHOSPHORUS RETENTION MODEL,
Michigan State Univ., East Lansing. Dept. of Resource Development.
K. H. Reckhow, and S. C. Chapra.
Water Resources Research, Vol 15, No 6, p 1643-1646, December 1979. 2 Fig, 4 Tab, 20 Ref.

Descriptors: *Lakes, *Phosphorus, *Limnology, *Michigan, Water quality, Model studies, Analytical techniques, Statistical methods, Mathematical models, Correlation analysis, Variability, Risks, *Lake Charlevoix(MI), Error analysis.

A statistical technique proposed for the estimation of the uncertainty in the prediction of phosphorus concentration in lakes using the Dillon-Rigler-Kirchner model can increase the practical value of this and similar models. The usefulness of this technique can be seen in its application to Lake Charlevoix, Michigan. But there are limitations on the use of this procedure, such as those that relate to model and data uncertainty. The technique described yields only an approximation of prediction uncertainty. This technique does have limitations, and they are as follows: (1) The phosphorus model is based on the assumption of a completely mixed lake. Thus the predicted phosphorus concentration is a spatial and temporal average value. This means that the prediction uncertainty refers to the uncertainty in the prediction as an estimate of the average value; it does not reflect any spatial and temporal variability in an application lake. (2) An empirical model like that proposed by Kirchner and Dillon should not be applied outside the range of conditions represented by the model development data set without prior verification. This constraint on the application of the model is important because the Kirchner-Dillon data set is fairly homogeneous and therefore not representative of the population of north temperate lakes. As a result of this homogeneity, the prediction uncertainty derived from the data probably is an underestimation of total uncertainty when applied to lakes outside the bounds of the data set. RELATIONSHIPS BETWEEN BACTERIAL POPULATIONS AND OXYGEN LEVELS IN THE CENTRAL BASIN OF LAKE ERIE,
Canada Centre for Inland Waters, Burlington (Ontario); and National Water Research Inst., Burlington (Ontario).
S. S. Rao, and A. A. Jurkovic.
Journal of Great Lakes Research, Vol 5, No 2, p 225-228, 1979. 3 Fig, 1 Tab, 15 Ref.

Descriptors: *Bacteria, *Dissolved oxygen, *Lake Erie, Hypolimnion, Epilimnion, Lakes, Microbiology, Carbon, Oxygen, Nitrogen, Water temperature, Sampling, Data processing, Limnology, Heterotrophic bacteria.

Studies were made to ascertain the relationships between bacteria and particulate organic carbon, particulate nitrogen, and the depletion of oxygen from the hypolimnetic waters of the central basin of Lake Erie. Heterotrophic bacterial populations, dissolved oxygen, particulate organic carbon, and total particulate nitrogen were determined during May, August, and September. Data indicated (1) a relationship between heterotroph populations and dissolved oxygen; (2) epilimnion oxygen concentrations of 9 mg/l were associated with bacterial levels of approximately 4000 colonies per ml; (3) bacterial densities started to increase from the thermocline downward; (4) hypolimnion oxygen levels of approximately 1 mg/l were associated with bacterial densities of approximately three times the epilimnion values; (5) bacterial oxygen uptake rate in the hypolimnion varied from 1.5 to 7.4 x 10 to the minus 10th power mg/l/hr; (6) particulate organic carbon and bacteria showed similar distribution patterns in the water column; (7) particulate nitrogen remained unchanged at 0.1 mg/l in the water column showing no relationship to the other parameters measured. CHEMICAL AND BIOLOGICAL QUALITY OF SELECTED LAKES IN OHIO - 1976 AND 1977,
Geological Survey, Columbus, OH. Water Resources Div.
R. L. Tobin, and J. D. Youger.
Geological Survey Water-Resources Investigations 78-109 (open-file report), September 1979. 291 p, 77 Fig, 144 Tab, 49 Ref.

Descriptors: *Ohio, *Lakes, *Limnology, *Water quality, *Lake morphology, Data collections, Thermal stratification, Water chemistry, Nutrients, Phytoplankton, Algae, Bacteria, Pesticides, Anaerobic conditions, Dissolved solids, Dissolved oxygen, Cations, Anions, Light penetration, Secchi disks, Inflow.

Twenty-eight Ohio lakes (14 per year) were evaluated in 1976 and 1977 for water-quality status. Spring and late summer data included physical and profile measurements for a broad spectrum of chemical and biological constituents. Secchi disk transparency ranged from 0.2 to 6.4 meters. Seasonal thermal gradients occurred in all lakes deeper than 5.2 meters and not controlled by subsurface release values. Anaerobic conditions, and high concentrations of ammonia, carbon dioxide, and hydrogen sulfide, developed in all lakes having stable thermal gradients. Maximum dissolved oxygen was measured at 17.8 milligrams per liter (220 percent saturation) in Summit Lake. Calcium, bicarbonate, and sulfate were the principal constituents. Specific conductance varied from 130 to 1250 micromhos. Pesticides residues were not detected and concentrations of trace metals were within State limits. Fecal coliform bacteria counts were generally low and within State standards. Blue-green algae dominated the phytoplankton communities in 18 lakes in spring and 26 lakes in summer. The maximum algal count was 3,400,000 cells per millimeter in Kiser Lake, and algal counts were above 100,000 cells per milliliter in 19 lakes. (Kosco-USGS)

Descriptors: *Water level fluctuations, *Lakes, *Dams, *Hydrogeology, *Groundwater movement, Model studies, Groundwater recharge, Inflow, Evaluation, Wisconsin, *Bass Lake(Wisc), *Mounds Pond(Wisc), St. Croix County(Wisc).

Bass Lake is one of several lakes in northern Wisconsin where high water levels in the early 1970's caused flooding of roads and homes. Because Bass Lake is a ground-water dominant lake with no inlet or outlet, it was speculated that high water levels were caused by increased ground-water discharge to the lake brought about by an impoundment, Mounds Pond, on the Willow River. The impoundment is located 1.5 miles to the south and is 12 feet higher than the normal elevation of Bass Lake. In order to determine the probable cause of the high lake levels, an investigation into the hydrogeology of the area was initiated in the field and utilizing the Trescott-Pinder-Larson (1976) computer model to simulate the effects on the lake elevation of changing various parameters. Bass Lake appears to be influenced by a regional flow-through system and a local recharge system in the southern part of the lake and a regional flow-through system in the northern part of the lake. Results of the field study indicate that there is no ground-water flow between Mounds Pond and Bass Lake. Furthermore, computer model simulations indicated that lowering Mounds Pond 10 feet, as had been suggested as a means of alleviating the flooding at Bass Lake, would have no effect on Bass Lake levels. Computer model simulations using an increase in recharge rate and climatological data indicate that an increase in precipitation caused the abnormally high lake levels observed during the early 1970's.

PRODUCTION OF VITAMIN B12, THIAMINE, AND BIOTIN BY FRESHWATER PHYTOPLANKTON,
Kochi Univ. (Japan). Faculty of Agriculture.
J. Nishijima, R. Shiozaki, and Y. Hata.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 2, p 199-204, January 1979. 2 Fig, 3 Tab, 27 Ref.

Descriptors: *Phytoplankton, *Cultures, *Vitamin B, *Primary productivity, *Lake Kojima(Japan), Laboratory tests, Vitamins, Biochemistry, Metabolism, Nutrients, Eutrophication, Chlorophyta, Scenedesmus, Chlorella, Chlamydomonas, Growth stage, Speciation, Growth rates, Age, Japan.

Results of anexic cultures of several freshwater phytoplankton species from Lake Kojima, a eutrophic lake in Japan, suggest that some phytoplankton may significantly contribute to the production of dissolved B-group vitamins found abundantly in the lake. Phytoplankton were isolated from Lake Kojima on 24 April 1972; species include Scenedesmus, Chlorella, Chlamydomonas, Carteria and Chroococcus. Phytoplankton require no vitamins for growth; however, Carteria growth is partially depressed in vitamin-free medium. Thiamine stimulates Carteria growth in early incubation periods. Phytoplankton synthesize and secrete considerable amounts of the B-group vitamins increasingly with culture age. In general, all species except Chroococcus produce biotin, thiamine and B12 in order of concentration in the culture media: biotin 750-4,000 pg/ml medium, thiamine 0-3,400 pg/ml medium and vitamin B12 0.3-20 pg/ml medium after incubation for 17 days. B-group vitamins are generally produced increasingly with culture age over the whole experiment period; however, thiamine production by Carteria begins at the start of the stationary growth phase and increases a little with culture age. Values are mostly as follows: vitamin B12, 100-10 micro pg/cell/d; thiamine 1.0-0.1 micro pg/cell/d (except for Chlamydomonas and Carteria during early log phase); and biotin, 100-10 milli pg/cell/d (except for Chroococcus with 1.0-0.1 nano pg/cell/d). Vitamin production abilities vary with phytoplankton species, growth stage and other growth conditions. (Danovich-Wisconsin)

SKELETONEMA POTAMOS (WEBER) HASLE AND CYCLOTELLA ATOMUS HUSTEDT (BACILLARIOPHYCEAE) IN THE PLANKTON OF RIVERS IN ENGLAND AND FRANCE,
Institute of Terrestrial Ecology, Cambridge (England); and Culture Centre of Algae and Protozoa, Cambridge (England).
J. H. Belcher, and E. M. F. Swale.
British Phycological Journal, Vol 13, No 2, p 177-182, June 1978. 7 Fig, 16 Ref.

Descriptors: *Diatoms, *Rivers, *Speciation, *England, *France, Plankton, Salinity, Distribution, Analytical techniques, Cytological studies, Microscopy, Size.

This paper is the first report on the occurrence of Skeletonema potamos and Cyclotella atomus in several localities in England and one in France. S. potamos occurred in May 1977 as a minor plankton component from Don River, Yorkshire, and in August 1977 from a tributary of River Colne, Gosfield, Essex. This species was also present in water from River Seine, Paris, France, August 1977. S. potamos forms short filaments of 2-4 cells, each 3-4 micro m wide and 6-10 micro m long sometimes with valves of adjacent cells in contact. Valve centers are flat but have a bevelled edge, so that V-shaped grooves are seen around cell contact areas. Cyclotella atomus was collected from the same river samples as S. potomas, from Trent River near Newark, Nottinghamshire in May 1977 and also from the Thames River at London Bridge in November 1977 in brackish water with 1 ppt salinity. Cells are cylindrical, 3.5-7.0 micro m in diameter. Valve faces are almost flat, but undulate slightly while edges are steeply angled. Frustules have marginal striae surrounding a plainer central area with a single off-center punctum, visible by light microscopy and appearing as a strutted process in electron microscopes. Both species live primarily in freshwater, though have halophilic tendencies. Both are small and could easily be overlooked if present in low numbers. S. potamos has a delicate wall, apt to disintegrate with normal cleaning and mounting procedures and is best recognized alive. (Danovich-Wisconsin)

Epiphytes growing ion Potamogeton richardsonii and similar plastic plants in Lake Memphremagog, Quebec-Vermont, during 1976-1977 growing seasons, were similar in biomass and primary production, giving little support to hypothesized symbiosis or competition between plant and epiphytes. P. richardsonii is probably a neutral substrate for epiphytes, whose primary function is to provide epiphytes with suitable support sufficiently high in the water column. However, some interaction between host plants and epiphytes do take place, although they are not reflected by growth and biomass rates. Lower alkaline phosphatase activity of epiphytes growing on natural plants suggests that these algae are less P-limited than those growing on plastic plants and which obtain P from lining macrophytes. Epiphytes growing on plastic leaves offset loss of the macrophytic P source through increased alkaline phosphatase activity. Algae do not experience significant benefit or detriment in terms of growth or biomass by growing on a common macrophyte. Significant interactions between epiphytes and macrophytes should not be automatically assumed. (Harris-Wisconsin)

At Roscoff, France, Zostera marina (eelgrass) grows to a depth of 4 m below MLWS in sandy bottoms, since all abiotic key parameters except light are consistent throughout this depth, light is the factor most likely responsible for eelgrass lower depth limits. Upper Z. marina limits are influenced by the time of water coverage and dessication. Aboveground biomass, leaf length, number of shoots/sq m correlates with time of water coverage. Biomass and production were measured February 1976-1977. Production was measured by a leaf marking technique together with determination of plastochrone interval, the time interval between the initiation of two successive leaves. Annual production is 1608 g dwt/sq m, maximum leaf biomass 257 g dwt/sq m and maximum total biomass 470 g dwt/sq m. The ratio of net annual production to maximum leaf biomass is 6.3 and that to maximum total biomass 3.4. Total biomass increases from February (190 g dwt/sq m), reaches maximum in August and declines in autumn and winter. Average turnover time for leaves is 68 days and for rhizomes 193 days, indicating that turnover rate of aboveground parts (1.5%/d) is higher than of underground parts (0.5%/d). Average plastochrone interval from April-October is 15.6 days; the mean for the whole year is 19.3 days. A survey on changes in the eelgrass beds since 1909 is also given. (Danovich-Wisconsin)

P. L. McCall, M. J. S. Tevesz, and S. F. Schwelgien.
Journal of Great Lakes Research, Vol 5, No 2, p 105-111, 1979. 4 Fig, 39 Ref. EPA R805716010.

Descriptors: *Sediments, *Mixing, *Benthic fauna, *Mollusks, *Lake Erie, Laboratory tests, On-site investigations, Suspended solids, Moisture content, Oxygen, Lakes, Biology, Limnology, Bivalves, Unionids, Sediment mixing, Mollusks burrowing.

The sediment reworking activities of an abundant Lake Erie unionid bivalve, Lampsilis radiata siliquoidea, were studied by field observations and laboratory experiments. Unionid burrowing in laboratory microcosms increased sediment water content 10-20%, decreased water content variability, homogenized sedimentary structures, and increased tenfold the volume of oxidized sediment over that in microcosms with no unionids. Incomplete mixing of sediment took place to a depth of 10 cm during burrowing by L.r. siliquoidea. Burrowing by other unionids may extend the depth of maximum reworking to 20 cm. Unionid burrowing, feeding, and respiratory activities may alter the profiles of various elements and radionuclides associated with sediment particles and alter the location and intensity of microbial activity in sediments. Sedimentology, Vol 26, No 6, p 795-812, December 1979. 10 Fig, 1 Tab, 40 Ref.

Descriptors: *Sediment transport, *Laboratory tests, *Sedimentology, *Testing procedures, Cohesionless soils, Methodology, Sediments, Movement, Sands, Currents(Water), Velocity, Streambeds, Waves(Water), Beds, Flow, Open channels, Incipient motion, Oscillatory flow, Flat beds, Critical velocity.

While the transport of sediment by unidirectional currents or by oscillatory (wave-induced) currents has been investigated, very little attention has been paid to the problem of the threshold of transport under the two mechanisms combined. Studies were carried out using cohesionless sand-sized (mean diameters: 142, 363, 771, and 1134 micrometer) quartz grains in a unidirectional flume, within which an oscillatory carriage had been installed. The experiments were carried out under unidirectional velocities ranging between 0 and 27 cm/s, combined with simulated wave-induced currents (at periods of 5 and 15 s) ranging from 0 to 35 cm/s. The threshold of transport was assessed, by visual observation, using the Yalin Criterion for unidirectional flow. This criterion permitted critical conditions to be estimated subjectively by observation of incipient transport from the flat beds. The results indicated the dependence of the critical threshold velocity combination on grain size and wave period. Thresholds tend to increase with increasing grain size or decreasing period. The grain-size dependence is predictable from existing empirical relationships for the separate mechanisms; statistical fluctuations in near-bed stress (bursting), however, are invoked to explain the wave period dependence. The latter effect acts in a reverse manner for wave and current combinations than for waves alone. Graphs are presented, relating grain size to critical threshold velocity combinations, to aid in the sedimentological interpretation of field data. (Humphreys-ISWS)

IMPACT OF NONPOINT POLLUTION CONTROL ON WESTERN LAKE SUPERIOR, RED CLAY PROJECT, FINAL REPORT: SUMMARY,
Environmental Protection Agency, Chicago. IL. Great Lakes National Program Office.
S. C. Andrews, D. S. Houtman, and W. J. Lontz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 200, Price codes: A03 in paper copy, A01 in microfiche. Report EPA 905/9-79-002. January 1979. 32 p, 5 Fig, 4 Tab.

Descriptors: *Nonpoint pollution, *Erosion control, *Lake Superior, *Sedimentation, *Water pollution, *Water pollution sources, *Erosion, Water quality, Water quality control, Water management(Applied), Nutrient loading, Turbidity, Slope stability, Land management, Soil loss, Vegetation effects, Monitoring.

This is the final document of the Red Clay Project, established in May 1974 under an EPA grant to demonstrate new methods for improving water quality in the Great Lakes. The focus of this project was the identification of nonpoint sources of pollution in the Western Lake Superior region. The area's predominant soils are red clays interspersed with sands and silts and are easily erodable. Major nonpoint sources of pollution are lakeshores, streambanks, and other slopes. The Red Clay project was a cooperative Federal-local research and demonstration project established to seek practical solutions to the red clay erosion and resulting water quality problems. The study area was divided into five geographical subdivisions representative of conditions in the entire water-

shed. Studies were undertaken of the condition and behavior of soils within the red clay area in order to utilize available sampling and testing techniques and opportunities to determine areas in which massive slope failure normally occurs. Researchers found that the use of vegetation was significant in erosion control. Red clay turbidity and sedimentation does not add to nutrient loads or oxygen levels in Lake Superior. Possible land management practices are presented. Monitoring of water quality and erosion were conducted at 13 stations, as well as monitoring of rainfall and temperature. Recommendations included keeping a common focus in multiple agency programs, providing cost sharing in nonpoint source pollution management efforts, identification of critical areas through preparation of conservation plans, using a voluntary compliance approach wherever possible, minimizing stream channel deepening, and using streambank vegetative cover wherever possible. A framework is presented for local management agency implementation of project recommendations. (Arnold-NC)

Center for Environmental Research, Cornell University Research Project Technical Completion Report, March 1980. 26 p, 4 Fig, 5 Tab, 10 Ref. OWRT-A-083-NY(1), 14-34-0001-8034 and 9034.

Descriptors: *Surface waters, Acid neutralization, Acid precipitation, *Acidity, *Neutralization, *Limestones, New York, *Adirondack region(NY), Evaluation, Geochemistry, Water chemistry.

This research project evaluated the use of limestone in packed bed reactors to neutralize acidified Adirondack surface waters (particularly streams). The project was composed of two phases: investigation of sediment-water interactions and evaluation of the kinetics of limestone packed bed reactor neutralization. Experimental results demonstrated that there is little sediment water interaction with regard to hydrogen ion in the Adirondack lakes and streams studied. The results also demonstrated that neutralization of acidified Adirondack surface water by limestone packed bed reactors is feasible. A preliminary design procedure is presented to show this feasibility.

Soft-sediment deformation features occur commonly on parts of intertidal sand bodies in Cobequid Bay, Bay of Fundy. These features are small- to intermediate-sized, slump-like bodies, 1-3 sq m in area, and located on the crest and upper stoss side of ebb megaripples. External modification of these slumps indicates that they formed before complete emergence. The deformed cross-bedding within these bodies extends to a depth of 0.15-0.35 m and shows that deformation occurred during slumping and flowage of liquefied sand down the megaripple stoss side. Field evidence and calculations strongly indicate that this liquefaction results from the impact of 0.1-0.3 m high waves breaking against the megaripple lee faces. Neither rapid drawdown of the water level nor earthquake shocks are reasonable alternative explanatios. Indigenous wave activity provides an attractive substitute to tectonism as an explanation of soft-sediment deformation in ancient shallow-water sediments. Slow wave-induced compaction may also account for the relative scarcity of deformation structures in shallow marine sand-stones. (Humphreys-ISWS)

ORIGINS OF OCEANIC PLANKTON IN THE MIDDLE ATLANTIC BLIGHT,
California Univ., Santa Barbara. Marine Science Inst.
J. Cox, and P. H. Wiebe.
Estuarine and Coastal Marine Science, Vol 9, No 5, p 509-527, November 1979. 6 Fig, 5 Tab, 58 Ref. ONR N00014-74-C0262, NR083-004.

Descriptors: *Eddies, *Zooplankton, *Species composition, *Middle Atlantic Bight, *Atlantic Coastal Plain, *Currents(Water), Gulf Stream, Continental shelf, Continental slope, Speciation, Meanders, Water circulation, Movement, Atlantic Ocean, Northeast U.S., Oceans, Physical properties, Flow, Sargasso Sea, Ocean circulation.

Introduction of expatriated zooplankton species into the mid-Atlantic Bight is largely associated with advective water movements onto the continental shelf. Arctic-Boreal species are brought in from the northeast largely by over-shelf transport. Transition zone species are brought in by slope water penetration, at the surface when horizontal density gradients are minimal and at mid-depth in response to physical processes such as estuarine-type circulation, wind-driven upwelling, cold-shelf water 'bubble' formation and movement out into slope waters, or shelf-slope water interactions associated with warm core eddies or rings. Tropical-subtropical species that commonly reside in the Gulf Stream and Sargasso Sea also occur in the mid-Atlantic Bight due to injections of warm core ring surface waters over the shelf. The Bight area is divided into three regions with regard to oceanic influences: (1) low salinity waters along the coast south of the Hudson River extending to Chesapeake Bay; (2) the continental shelf edge extending outward from Long Island Sound to past Delaware Bay; (3) the southern sector, including the shelf edge south of 37 degrees N and extending landward south of Chesapeake Bay. Cluster analysis of seasonal transect data off New Jersey verifies the faunal distinctness of regions 1 and 2. Region 1 shows little oceanic influence in terms of expatriate species due to 31 ppt salinities. Region 2 is occupied by slope water species and roughly defines the limits of the cold water species. The southern sector is characterized by warm water species. (Danovich-Wisconsin)

PHYSIOLOGICAL ASPECTS OF PRIMARY PRODUCTION IN SEAGRASSES,
Gatty Marine Lab., St. Andrews (England).
E. A. Drew.
Aquatic Botany, Vol 7, No 2, p 139-150, October 1979. 10 Fig, 4 Tab, 12 Ref.

Descriptors: *Marsh plants, *Primary productivity, *Photosynthesis, *Temperature, *Plant physiology, *Estuarine environments, Irradiation, Laboratory tests, Speciation, Respiration, Leaves, Chlorophyll, Light, Light intensity, Thermal stress, Water temperature, Aging(Biological), Photoperiodism, Estuaries, Grassed waterways, Seasonal.

Laboratory experiments on six seagrass species show that all have similar, classic photosynthesis versus irradiance curves which are usually light-saturated at 2-3 mW/sq cm PAR, and have correspondingly low compensation irradiances since their dark-respiration rates are relatively low. Light-saturated photosynthetic rates vary 26.0-8.1 micro C/sq cm h, depending on species. Maximum photosynthetic rate does not correlate with potential depth distribution; an intertidal species, Phyllospadix torreyi, has the highest rate and one from 33 m, Posidonia oceanica, has the lowest. Light-saturated photosynthetic rates increase in direct proportion to temperature increases up to 30-35C.

above which thermal damage causes rapid reduction. Respiration rates are not so dramatically affected by increasing temperatures. Photosynthetic rates closely correlate with chlorophyll content up to 50-60 micro chl/sq cm. P. oceanica shows marked seasonal photosynthetic rate variations high in spring and low in summer. Low summer rates result from reduced chlorophyll content due to general leaf senescence in this species in early summer. Chloroplast movement in Halophila stipulacea is complex and reduces photoinhibition. Species used in experiments include Cymodocea nodosa, H. stipulacea, P. torreyi, P. oceanica, Zostera angustifolia and Z. marina. (Danovich-Wisconsin)

A DIATOM ASSEMBLAGE LIVING BELOW THE SURFACE OF INTERTIDAL SAND FLATS,
Bristol Univ. (England). Dept. of Botany.
F. E. Round.
Marine Biology, Vol 54, No 3, p 219-223, 1979. 2 Fig, 1 Tab, 14 Ref.

Descriptors: *Diatoms, *Barnstable Harbor(MA), *Sediments, *Intertidal areas, *Spatial distribution, *Vertical migration, Ecology, Sands, Speciation, Distribution, Tides, Habitats, Tidal effects, Light, Light intensity, Color, Depth, Drying, Systematics, Amphora cymbifera, Diurnal.

A non-migratory endopsammic diatom association was discovered living below the sand surface of intertidal flats at Barnstable Harbor, Massachusetts. Top sand layers (1 mm) are brown due to dense Hantzschia virgata populations; this species migrates to the surface during tidal exposure. H. virgata moves freely in the spaces between and over sand grains. The colorless middle layer (3 mm) is a mixed zone. H. virgata migrates downwards from the surface layer into this layer prior to dusk. The lowermost layer (3 mm thick) lies above the black anaerobic zone. Large motile pennate species, which presumably do not migrate (Navicula cancellata, Nitzschia spathulata), inhabit this area. Small epipsammic species are also abundant; however, Amphora cymbifera, which attaches to sand grains, characterizes this zone. While this A. cymbifera assemblage is strictly part of the epipsammic community, it differes from the more widespread epipsammic flora in its spatial distribution. Visual observation reveals a much greater cell concentration below 3-4 mm depth. Light intensity is less at greater depths; however, desiccation is a limiting factor in surface layers. Movement of surface sand during tidal covering and uncovering also leads to species loss from sand grains. (Danovich-Wisconsin)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

TECHNICAL AND ECONOMIC EVALUATION OF AN MSF SOLAR ENERGY POWERED DESALINATION PLANT,
S. Arazzini, G. Tomei, E. Ciccone, and G. Fiorito.
Desalination, Vol 31, No 1-3, p 443-455, October 1979. 5 Fig, 1 Tab.

Descriptors: *Solar energy, *Economic feasibility, *Desalination plants, *Technology, *Systems analysis, *Cost analysis, Solar distillation, Water treatment, Desalination processes, Desalination apparatus, Water purification, Economics, Costs, Design, Design criteria, Economic justification, Electric power, Reliability, Evaluation.

The most feasible desalination plant powered by solar energy, considering technical and economic aspects, is one using a single field of double axis tracking collectors. Besides its low cost, it presents the easiest plant arrangement and process parameters control. The type of desalting unit chosen is the multistage flash (MSF) with brine recirculation, since it allows the greatest guarantee of reliability over long time periods. High solar energy costs necessitate the highest performance ratio values that can be obtained; the plant is designed as a 500 cu m/d, 46 stage, cross-tube type with 121C top brine temperature and 38.5 Kcal/kg distillate specific heat consumption. Different systems to trap solar energy are considered, taking into account process parameters such as: outlet fluid temperatures from solar receivers, performances, power production system, power consumptions, energy storage, back-up and energy integration systems, and desalting and solar equipment reliability. Three different solutions are examined: (1) double axis collectors with a main storage tank volume; (2) double and single axis collectors with oil and pressurized water tank volumes; and (3) double and single axis collectors with electrical storage (batteries). A solar powered desalting plant is not only feasible, but also attractive economically at least in some countries. (Danovich-Wisconsin)

Descriptors: *Water quality control, *Waste water disposal, *Diversion, *Lake renewal, *Spray irrigation, Lakes, Trophic level, Nutrients, Michigan, Muskegon Lake(MI), Mona Lake(MI), White Lake(MI), Phosphorus, Chlorophyll, Secchi disks, Waste water treatment, Sampling, Water utilization, Eutrophication.

In 1973, Muskegon County, Michigan began diversion of industrial and municipal wastewater discharges from Muskegon, Mona, and White lakes in an effort to reverse environmental and economic degradation in the region and to meet stringent U.S. Environmental Protection Agency effluent standards. The wastewater was pretreated in aerated lagoons, disinfected, and sprayed on agricultural land. Drainage from the spray irrigation site was collected and discharged to the tributaries of three lakes. The extensive limnological investigation conducted in conjunction with the project focused on eutrophication-related parameters. Tributary and lake sampling began prior to wastewater diversion in 1972 and continued through 1975. Sampling was conducted approximately biweekly during the ice-free season, and monthly during the ice season. Fourteen sampling locations were selected to assess the spatial variation of water quality in each lake and to evaluate the importance of various point sources of contamination. The wastewater treatment has resulted in a significant decrease of phosphorus concentrations in Mona and Muskegon lakes, and in a decrease of chlorophyll-a in Muskegon and White lakes. None of the lakes experienced significant improvements in Secchi disc transparency. The diversion project has altered the overall condition of the lakes in such way that the lakes should be responsive to additional reductions in nutrient loadings. (Harris-Wisconsin)

Water and Sewage Works, Vol 126, No 8, p 28-30, August 1979. 3 Fig, 7 Tab.

Descriptors: *Water conservation, *Water rates, *Economics, *Elasticity of demand, Costs, Water costs, Rates, Economic impact, Social aspects, Water utilization, Consumptive use, Income, Water demand, Utilities, Pricing, Economic efficiency, Public health, Safety, Potable water.

This second half of a two-part article concerning various economic incentives for water conservation, deals specifically with the influence of elasticity and rate structure on use patterns. The foremost principal of conservation is to minimize total water use costs to the community and not necessarily the rate per unit water. Knowledge of demand elasticities for different water uses is important in estimating effects of pricing policies or rate structure relative to conservation objectives. Water demands are generally inelastic (-0.1 to -0.5) but some water uses such as lawn-watering are elastic (-0.5 to -1.2). Efficient and equitable rate structures create awareness of water resource problems. Uniform rates reward water conservation if the total bill is reduced when less water is used. Where average costs are rising, the average or uniform rate is not necessarily equitable; those who conserve water have to pay more per unit because of large water use by others. Decreasing block rates encourage water use. Increasing block rates are the most effective rates to achieve water conservation, flow-reduction objectives. Fairness problems with increasing block rates raise basic questions: (1) the major objective of utilities is to provide safe, potable water; (2) there is a payment burden of prior residents to pay higher costs caused by demands of newer residents. The increasing block rate is efficient in that it places utilities in competition for disposable income at high water-consumption levels but allows them to meet their public service, health and safety functions at minimum cost to consumers. MULTIOBJECTIVE DYNAMIC PROGRAMMING WITH APPLICATION TO A RESERVOIR,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
G. W. Tauxe, R. R. Inman, and D. M. Mades.
Water Resources Research, Vol 15, No 6, p 1403-1408, December 1979. 3 Fig, 13 Ref. OWRT B-105-ILL(3).

Descriptors: *Water resources, *Reservoirs, *Dynamic programming, *Model studies, Mathematical models, Computer models, Mathematics, Equations, Management, Water

management(Applied), Reservoir operation, Storage, Powerplants, Hydroelectric power, Evaporation, Analytical techniques.

The analysis of water resource problems often involves noncommensurable objectives. Where this is the case, no clear-cut optimum solution exists, but rather a whole set of technologically efficient 'noninferior' solutions exists. A water resources decision maker, who reflects society's preferences, chooses the single noninferior solution preferred to all the others. Multiobjective dynamic programming was introduced as an extension of dynamic programming which can provide the decision maker with the entire noninferior set of solutions as well as the explicit trade-offs between noncommensurable objectives at all objective levels to aid him in the decision-making process. The technique made possible the quantitative analysis of multiple-objective problems which would provide great difficulties for the existing methods. An example of such a problem was presented and solved by multiobjective dynamic programming. The problem involved the generation of the noninferior set and trade-off curves for the operation of a reservoir considering three objectives. (Sims-ISWS)

MULTIOBJECTIVE DYNAMIC PROGRAMMING: A CLASSIC PROBLEM REDRESSED,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
G. W. Tauxe, R. R. Inman, and D. M. Mades.
Water Resources Research, Vol 15, No 6, p 1398-1402, December 1979. 1 Fig, 16 Ref. OWRT B-105-ILL(2).

Descriptors: *Water resources, *Reservoirs, *Planning, *Model studies, Mathematical models, Dynamic programming, Computer programs, Mathematics, Equations, Management, Reservoir operation, Storage, Irrigation, Water management(Applied), Analytical techniques.

The problem of noncommensurable multiple-objective functions in water resources and potential methods for solving such multiobjective problems were discussed. A new method, namely, multiobjective dynamic programming (MODP), that borrows from conventional dynamic programming, was developed. It generates the entire noninferior solution set of the multiobjective problem, and it can be used to generate the trade-off ratios between objectives. The trade-off ratios are actually a by-product of the MODP method and are available explicitly between all objectives. The noninferior solution set is obtained solely in terms of the objectives rather than in terms of the individual decisions that influence each objective, thus facilitating the decision maker's task in choosing the preferred solution. The Reid-Vemuri multiobjective problem in water resources was chosen as an example and was successfully solved using MODP. (Sims-ISWS)

EFFECTS OF CLEARCUTTING ON SOIL WATER DEPLETION IN AN ENGELMANN SPRUCE STAND,
Utah State Univ., Logan. Watershed Science Unit.
G. E. Hart, and D. A. Lomas.
Water Resources Research, Vol 15, No 6, p 1598-1602, December 1979. 2 Fig, 4 Tab, 16 Ref. UTA 777.

Descriptors: *Clear-cutting, *Soil water, *Water yield, *Utah, Lodgepole pine trees, Soil moisture, On-site tests, Watersheds(Basins), Evapotranspiration, Demonstration watersheds, Water equivalent, Water yield improvement, Watershed management, Engelmann spruce trees, Soil water depletion.

Soil water depletion was monitored for five growing seasons on 0.4-hectare plots in a mature stand of Engelmann spruce in northern Utah. Three plots were then clear-cut, and in the first season soil water depletion was 20 to 25 cm less than on an uncut plot. This change, which represents a savings of water previously lost to evapotranspiration, is considerably greater than reported for comparable studies in aspen and lodgepole pine. The effects of clear-cutting on soil water depletion are expected to persist for as many as 50 years. In the first winter after cutting, peak snow water equivalent in the clear-cut plots averaged 91 cm, or 31 cm greater than for the uncut control plots. (Humphreys-ISWS)

POST-WAR LAND DRAINAGE, FERTILIZER USE AND ENVIRONMENTAL IMPACT IN NORTHERN IRELAND,
New Univ. of Ulster, Coleraine (Northern Ireland). School of Biological and Environmental Studies.
D. N. Wilcock.
Journal of Environmental Management, Vol 8, No 2, p 137-149, 1979. 4 Fig, 3 Tab, 23 Ref.

Descriptors: *Drainage programs, *Fertilization, *Environmental effects, *Northern Ireland, Drainage districts, Streamflow, Water quality, Fish management, Legislation, Drainage area, Watersheds(Basins), Tributaries, Sediment transport, Rivers.

Coordinated efforts to implement land drainage schemes in Ireland date to 1842, when 113 drainage districts were established throughout the country. However, most of the drainage schemes predating 1940 were piecemeal and ineffective. In 1947, the Drainage Act introduced a comprehensive strategy of land drainage into which local field drainage schemes were later integrated. In order to implement the Act, a Drainage Council was established. Between 1947 and 1977, the Council has designated 212 rivers (1,878 km) as the main arteries. Projects on these rivers varied in size and type of work performed. Some projects involved removal of local obstructions to flow, major channel realignments and substantial widening of the rivers. Since 1948, the total benefit area was 38,366 ha. In addition, efforts were made to improve outflow conditions in the tributaries of the main rivers. Between 1947 and 1976, 3,250 km of tributary channels have been improved. Under the auspices of the same program, financial assistance was made available for urban and rural drainage projects and fertilizer use. The improvements affected streamflow, water quality and fish production. However, research on the relationship between the drainage schemes and the resultant environmental impacts in Ireland has just begun. It is not known how drainage projects affected streamflow. Also, more research is needed to evaluate the effect of increased fertilizer use and sediment transportation on water quality and fish production. (Harris-Wisconsin)

EFFECT OF INFILTRATION RATE ON BIOLOGICAL CLOGGING AND WATER QUALITY CHANGES DURING ARTIFICIAL RECHARGE,
Tohoku Univ., Sendai (Japan). Dept. of Civil Engineering.
T. Okubo, and J. Matsumoto.
Water Resources Research, Vol 15, No 6, p 1536-1542, December 1979. 12 Fig, 4 Tab, 8 Ref.

Descriptors: *Artificial recharge, *Clogging, *Infiltration rates, Laboratory tests, Mathematical models, Infiltration, Water reuse, Biology, Dissolved oxygen, Ammonia, Chemical oxygen demand, Recharge, Waste water disposal, Hydraulic conductivity, Groundwater movement, Groundwater, Biological clogging.

The effect of infiltration rate on biological clogging and water quality changes was investigated experimentally using a sand column. The concentration of soluble COD in the effluent was stable during 3 months of infiltration, and the lower the initial infiltration rate was, the higher the average percentage of the reduction of soluble COD became. The soluble COD was primarily removed in the surface layer. The hydraulic conductivity in the bottom layer decreased at the highest infiltration rate. The variation of infiltration rate was divided into four stages. In addition, the biological-clogging model was proposed, and the mechanism of biological clogging was discussed. (Sims-ISWS)

THE BALANCE OF GROUNDWATER RESOURCES OF THE EUROPEAN COMMUNITY: A METHODOLOGY FOR A MULTINATIONAL PROBLEM,
Strasbourg-1 Univ. (France).
J. J. Fried, and M. Zampetti.
Water Supply and Management, Vol 3, No 3, p 201-204, 1979.

Descriptors: *Groundwater, *Groundwater resources, *European community, *Water supply, *Groundwater management, *Model studies, *Environmental protection, Resources, Water resources, Groundwater availability, Groundwater utilization, Groundwater potential, Protection, Groundwater recharge, Exploration.

A major part of the freshwater resources available in the European Community is made up of groundwater. The Commission of European Communities is thus emphasizing actions of protection and management of water resources and particularly of groundwater resources. It has undertaken a series of studies on the availability of water resources, management methods, medium and long-term supply problems, integrated management, and classification of community territory on the basis of environmental characteristics. Based on these studies a new study is underway which should produce a quantitative assessment of groundwater resources. The aim is to estimate the available resources in present conditions of recharge and exploitation as well as potential development areas and complementary resources. Only existing data will be used. The hydrogeological results will be made available in 1979. The study is led by consultants and a coordinator who will present the final synthetical analysis. In addition, to cope with any difficulties and to harmonize the scientific approaches there is a panel to debate fundamental questions and common technical problems. In addition to the synthetical report, national reports and four community maps (aquifer inventory, hydrogeological situations, exploration, available resources) will be published. (Iervolino-NC)

SOURCES OF SEDIMENT INDUCED REDUCTIONS IN WATER QUALITY APPRAISED FROM CATCHMENT ATTRIBUTES AND LAND USE,
H. W. Anderson.
In: Proceedings of Third World Congress on Water Resources, Mexico City, Mexico, April, 1979. Vol 8. p 3603-3613, 1979. International Water Resources Association, Mexico City.

Descriptors: *Sedimentation, *Water quality, Erosion, *Suspended sediment, Geology, Faults, Landslides, Topography, Slope, Channels, Forest fires, Logging, Lumbering, Watershed management, Streamflow, Snow, Geomorphology, Elevation, Grasslands, *Sediment transport, *Land use, Watesheds(Basins), Regression analysis, Principal components, Rain-snow frequency, Catchments, Channel slope, Grazing, Vegetation, Sediment sources, Turbidity.

Suspended sediment measurements from 61 northern California watersheds were utilized in relating normalized suspended discharge to 10 watershed attributes. Suspended sediment was normalized by using long-term streamflow of each watershed. Factor analysis showed no confounding among the 10 variables; regression on principal components gave an explained variance of 0.73. Landslide potential contributed 42 percent of the explained variance; land-use variables 30 percent; streamflow and rain-snow frequency, 14 percent; geology including faults, 11 percent; and channel slope the other 3 percent. The regression coefficients indicated that watershed shape was the least important variable, with palm-shaped watershed having only 13 percent more sediment discharge than dendritic-shaped watersheds. Different landslide classes produced the greatest differences in sediment discharge: sediment discharge from landslide class 6 was 12 times as great as that from class 1. Use of the results were illustrated in separating normal from accelerated sediment production in the Redwood Creek basin. A separate analysis related landslide class to 6 watershed attributes and broad geologic rock types.

DEPOSITIONAL CHARACTERISTICS OF SEDIMENTS AT A LOW ENERGY OCEAN DISPOSAL SITE, SAVANNAH, GEORGIA,
Skidaway Inst. of Oceanography, Savannah, GA.
G F. Oertel.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 97-107, 1979. 3 Fig, 10 Ref. Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Waste disposal, *Water pollution effects, *Sediments, Sedimentation, Environmental effects, Georgia, *Outer Continental Shelf, *Dredged material, Ocean dumping, Savannah Harbor.

Since the early 1900's, the bar-channel system of the Savannah navigation channel has been dredged for maintenance and improvement. Between 1967 and 1977, approximately 10.8 x 1,000,000 cu yds (8.3 x 1,000,000 cu meters) of this dredge material was deposited at a predetermined ocean disposal site. The prominent sources of material dredged from the navigation channel are fine-grained river deposits, littoral sands, Pleistocene river gravels, and submarine Miocene outcrops. Material that is released from hopper dredges is hydraulically sorted as it settles through the water column. Coarse material is deposited in relatively thick mounds corresponding to the disposal path of the dredge; thin layers of fine material accumulate in deeper areas adjacent to mounds. After deposition, the fine and coarser material is relatively stable during non-storm conditions. During storm conditions, coarse material in the upper parts of the mounds are reworked by waves and storm currents. (Sinha-OEIS)

CHEMISTRY OF WATER MILFOIL TISSUE: SEASONAL VARIATION IN SUBMERSED APICES,
New Hampshire Univ., Durham. Dept. of Botany and Plant Pathology.
K. D. Kimball, and A. L. Baker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-159726, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Center, University of New Hampshire Research Report 25, 1980. 47 p, 46 Fig, 3 Tab, 35 Ref. OWRT A-043-NH(3), A-052-NH(1).

Descriptors: *Minerals, *Chemical properties, *Plant tissues, *Submerged plants, Phosphorus, Sodium, Potassium, Calcium, Magnesium, Iron, Manganese, Zinc, Copper, *Water pollution effects, *Seasonal variations, *Myriophyllum heterophyllum, *Mineral levels, *Water milfoil, Lake Winnipesaukee(NH), Nutrient availability.

The mineral composition of submersed apices in Myriophyllum heterophyllum from Lake Winnipesaukee were analyzed from 1976 through 1978. Seasonal changes in ash, phosphorus, sodium, potassium, calcium, magnesium, iron, manganese, zinc and copper were quantified. The magnitude of the seasonal and spatial variations in mineral tissue levels is large. Ash, phosphorus, sodium, potassium, calcium and magnesium vary by a factor (max/min) of 3-5 during an annual cycle. Variations for iron, manganese and zinc are much greater, with max/min ratios of 13-64. Our results question the practicality and validity of reported techniques which use mineral concentrations as an index of nutrient availability and as monitors of aquatic pollutants. We also conclude that inter- and intraspecific comparisons in the chemical composition of aquatic plants should include seasonal analysis on the different plant tissues, if nutrient dynamics and interrelationships of rooted aquatic plants with water and sediment chemistry are to be understood.
W80-03910

HUMAN VIRUSES IN THE AQUATIC ENVIRONMENT: A STATUS REPORT WITH EMPHASIS ON THE EPA RESEARCH PROGRAM.
Environmental Research Center, Cincinnati, OH.
Report to Congress No EPA-570-9-78/006, December 1978. 44 p, 1 Fig, 2 Tab, 88 Ref, 2 Append.

Descriptors: *Viruses, *Disease, *Public health, *Potable water, *Human diseases, Epidemiology, Water pollution sources, Sewage treatment, Environmental sanitation, Water sampling, Sanitary engineering, Water purification, Disinfection, Indicators, Analytical techniques.

Knowledge on the transmission of waterborne enteric human viruses is reviewed. Approximately 100 such viruses are excreted in large numbers in the feces of infected individuals. While the viruses do not multiply in aquatic environments they may survive for long periods of time and may be present in drinking waters. While outbreaks of viral diseases caused by drinking sewage-contaminated water are well documented, the role of 'acceptable' drinking water in this transmission is not clear. The Environmental Protection Agency (EPA) has been active in the development of methods for the recovery of low numbers of viruses from large water samples. Viral detection methods have improved in the past 15 years but are still not adequate to assess the possibility of extremely low levels of viruses existing in 'acceptable' drinking water. Also due to the common person-to-person spreading of these diseases it is difficult to access the role of drinking water in the transmission. EPA has collected and tested 250 drinking water samples from 56 systems in the past 6 years with no viral isolations having been made. Other laboratories have made some confirmed isolations from treated drinking water samples but better detection techniques are needed. Despite much research and study the possibility of 'focal infections', those caused by ingestion of water containing very low levels of virus, has been neither proved nor disproved. It currently appears that full conventional water treatment is needed to provide a reasonable assurance of virologically safe drinking water. Recommendations are made for the improvement of recovery methods and for the development of more effective sewage treatment. (Seigler-IPA)

CHARACTERIZATION OF THE WATER QUALITY IN THE SAINT LAWRENCE RIVER: DETERMINATION OF HOMOGENEOUS ZONES BY CORRESPONDENCE ANALYSIS,
Institut National de la Recherche Scientifique, Rimouski (Quebec).
M. Lachance, B. Bobee, and D. Gouin.
Water Resources Research, Vol 15, No 6, p 1451-1462, December 1979. 6 Fig, 4 Tab, 12 Ref.

Descriptors: *Water quality, *St. Lawrence River, *Correlation analysis, Nitrogen, Phosphorus, Turbidity, Nutrients, Sampling, Data processing, Analytical techniques, Rivers, Pollutants, Water pollution, Spatial distribution.

The application of correspondence analysis to data for turbidity, inorganic nitrogen, and inorganic phosphorus gathered at 112 stations located in the Cornwall-Quebec reach of the Saint Lawrence River allows the behavior of these three parameters to be detailed. A cluster analysis applied to the results of correspondence analysis leads to the definition of homogeneous zones which are characterized by values of the three parameters considered. The results obtained enter into the design processes of quality network for the Saint Lawrence River by allowing for the elimination of a certain number of stations. (Sims-ISWS)

ANALYSIS OF NEVADA SURFACE WATERS FOR PATHOGENIC AMOEBAE AS INDICATORS OF THERMAL POLLUTION,
Nevada Univ., Reno. Desert Research Inst.
J. Thomford, and R. Mead.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158041, Price codes: A02 in paper copy, A01 in microfiche. Publication 50015, February 1980, 23 p, 9 Tab, 24 Ref. OWRT A-092-NEV(1), 14-34-0001-9030.

Descriptors: *Water quality, *Pathogenic amoebae, *Thermal pollution, Water analysis, Indicators, Bioindicators, Nevada, Truckee River(Nev), Carson River(Nev).

Two major rivers in northwestern Nevada, the Truckee and Carson, were examined for the occurrence of the potentially pathogenic, free-living amoebae, Naegleria fowleri, Acanthamoeba culbertsoni and A. rhysodes, for a period of one year. Water quality was also monitored. A. rhysodes and a strain believed to be intermediate to N. gruberi and N. fowleri were isolated and identified. Presence of the recovered N. fowleri strain and A. rhysodes was compared to water temperature in an attempt to determine whether the presence of either of these species might be utilized as an indication of thermal pollution.

ANALYTICAL METHOD FOR NONIONIC SURFACTANTS IN LABORATORY BIODEGRADATION AND ENVIRONMENTAL STUDIES,
Soap and Detergent Association, New York.
S. L. Boyer, K. F. Guin, R. M. Kelley, M. L. Mausner, and H. F. Robinson.
Environmental Science & Technology, Vol 11, No 13, p 1167-1171, December 1977. 2 Fig, 5 Tab, 12 Ref.

Descriptors: *Water chemistry, *Analytical techniques, *Biodegradation, *Surfactants, *Foaming, Detergents, Water quality, Laboratory tests, Ion exchange, Colorimetry, Methodology, Foam fractionation, Foam separation, Chemicals, Chemical degradation, Measurement, Evaluation, Testing procedures, Water analysis, Quality control.

For biodegradation studies, the measurement of cobalt thiocyanate active substances (CTAS) is recommended along with sublation; for environmental studies, an improved sublation procedure, ion exchange and CTAS measurement are recommended. Of the colometric techniques, cobalt thiocyanate measurements are successfully applied to biodegradation and environmental studies. Nonionic surfactants are determined by complexation with cobalt thiocyanate and subsequent colorimetry. Simplicity and fast operation make it an attractive alternative to bismuth potentiometric measurements. The 1972 Wickbold methods (DAS) for trace nonionic surfactant levels involves nonionic isolation by foaming. The Wickbold sublation procedure is an effective and relatively simple concentration step for surface active agents; however, in environmental samples, ion-exchange separation must take place after sublation. CTAS and Wickbold's procedure, or bismuth potentiometric measurements, yield comparable analytical data, allowing mutual acceptance of data collected by either method and providing a proven alternative method. CTAS and DAS comparability for environmental monitoring was established consensually among six laboratories. Light and heavy solids from sewage influent were investigated. Interlaboratory relative standard deviations were 11% for the light solids solution and 16% for the heavy solids solution. Nonionic recovery was 90% with four sublations. (Danovich-Wisconsin)

FUNDAMENTAL STUDIES ON THE INFLUENCE OF OIL POLLUTION UPON MARINE ORGANISMS--V THE TOXICITY OF THE GELLING COMPOUNDS FOR PETROLEUM TO MARINE ORGANISMS (IN JAPANESE),
Tokyo Univ. (Japan). Dept. of Fisheries.
H. Tokuda.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 11, p 1385-1387, 1979. 3 Tab, 7 Ref, (English Summary).

Descriptors: *Toxicity, *Organic compounds, *Oil pollution, Diatoms, Marine fish, Mortality, Lethal limit, Bioassay, Oil, Growth rates, *Gelling compounds.

The toxicity of two products (abbrev. A and B) of the gelling compounds used to solidify petroleum was assayed for a marine diatom, Skeletonema costatum, and a rice fish, Oryzias Patipes, which had been previously acclimated to sea water. The following results were obtained: the lethal amounts of A and B to the diatom are more than 1,000 mg/l and 560 mg/l respectively, when A and B are separately added to the culture medium; the 24-h LA50 (which means the lethal amount of the gelling compound to 50% of the test organisms in 24 hours) of A and B to the fish are 7,400 mg/l and 4,700 mg/l respectively, when A and B are separately added to the test sea water; the filtrate of the culture medium or the sea water containing A or B is far less toxic to these test organisms. (Deal-EIS)

HEAVY METAL TOLERANCE OF MARINE PHYTOPLANKTON. IV. COMBINED EFFECT OF ZINC AND CADMIUM ON GROWTH AND UPTAKE IN SOME MARINE DIATOMS,
Trondheim Univ. (Norway). Inst. of Marine Biochemistry.
G. S. Braek, D. Malnes, and A. Jensen.
Journal of Experimental Marine Biology and Ecology, Vol 42, p 39-54, 1980. 11 Fig, 5 Tab, 17 Ref.

Descriptors: *Zinc, *Cadmium, *Diatoms, *Absorption, Toxicity, Heavy metals, Growth rates, Sorption, Phytoplankton, Path of pollutants, Metabolism, Magnesium.

Combinations of zinc and cadmium ions acted synergistically on the growth of the marine diatoms Thalassiosira pseudonana and Skeletonema costatum. Mixtures of the metals behaved less than additively on Phaeodactylum tricornutum and antagonistically on Skeletonema costatum. Sorption studies supported the hypothesis that the two latter algae gained their relative resistance to heavy metal ions from competition for uptake sites by the zinc and cadmium species involved. In the more resistant alga, Phacodactylum tricornutum, the sorption of cadmium and zinc was also dependent on the magnesium concentration of the medium, in a way which indicated a common uptake route for several divalent cations in this species. Cadmium was found to be more toxic than zinc to Skeletonema costatum and to Thalassiosira pseudonana, while zinc was slightly more toxic than cadmium to Phacodactylum tricornutum and Skeletonema costatum. HAEMATOLOGICAL ASSESSMENT OF THE EFFECTS OF THE ANAESTHETIC MS222 IN NATURAL AND NEUTRALIZED FORM IN THREE FRESHWATER FISH SPECIES: HAEMOGLOBIN ELECTROPHORESIS, ATP LEVELS AND CORPUSCULAR FRAGILITY CURVES,
Randse Afrikaanse Univ., Johannesburg (South Africa). Dept. of Zoology.
G. L. Smit, J. Hattingh, and A. P. Burger.
Journal of Fish Biology, Vol 15, p 655-663, 1979. 2 Fig, 3 Tab, 12 Ref.

Descriptors: *Toxicity, *Fish physiology, *Organic compounds, Aquiculture, Carp, Rainbow trout, Mode of action, Electrophonesis, Chemical analysis, Freshwater Fish, Fish management, Chemical properties, *MS222, *Fish anaesthetics, *Anaesthetics, *Blood chemistry, *Tissue analysis, *Sarotherodon.

The effects of MS222 and neutralized MS222 anaesthesia on haemoglobin electrophoresis, erythrocyte adenosine triphosphate (ATP) levels and corpuscular fragility curves were studied in Cyprinus carpio, Sarotherodon mossambicus and Salmo gairdneri. Haemoglobin electrophoresis showed no significant intra-species differences in the percentage composition of the various fractions for any concentration of MS222 and neutralized MS222 used. Significant interspecies differences were, however, still observed. ATP levels showed intra- and interspecies differences ascribed to the response of the fish species to MS222-induced stress and not to actual changes in erythrocyte ATP concentrations. Differences were also observed in corpuscular fragility curves for all three species when using MS222 or neutralized MS222 compared to curves obtained without the use of the anaesthetic, but the mechanisms involved are not clear. (Deal-EIS)
W80-03988

THE EFFECT OF DISSOLVED COPPER ON THE INCREASE IN LENGTH OF FOUR SPECIES OF INTERTIDAL FUCOID ALGAE,
Trondheim Univ. (Norway). Museum.
T. Stromgren.
Marine Environmental Research, Vol 3, p 5-13, 1980. 7 Fig, 14 Ref.

Descriptors: *Copper, *Toxicity, *Growth rates, *Phaeophyta, Algae, Inhibition, Heavy metals, Statistical analysis, Resistance, Length, Bioassay, Water chemistry, Aquatic plants, *Fucus, Pelvetia.

The growth of Pelvetia canaliculata, Fucus spiralis, Fucus vesiculosus and Fucus serratus is measured in various concentrations of copper (12-970 microg/litre) during a period of ten days. Significant reductions in growth were observed at 12 microg/litre of copper added for P. canaliculata and F. spiralis, at 25 microg/litre for F. serratus and at 50 microg/litre for F. vesiculosus. There is a linear relationship between the percentage reduction (z) in growth rate and the product of time (x) and concentration (y), giving the equation $z = k X x X y$. The constant k is specific and may be used as a measure of resistance capacity to copper exposure. When previous data on Ascophyllum nodosum are included the five large Fucoids in the intertidal area may be ranked as follows according to their resistance capacity: A. nodosum > F. vesiculosus > P. canaliculata APPROX. F. spiralis > F. serratus. (Deal-EIS)

MECHANISMS OF REGULATION OF THE ACID-BASE BALANCE IN FISH AS THEY ADAPT TO CARBON DIOXIDE LEVELS IN AN AQUEOUS ENVIRONMENT,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
V. D. Romanenko, V. A. Krisal'nyy, and N. I. Kotsar.
Hydrobiological Journal, Vol 14, No 5, p 41-47, 1978. 3 Fig, 19 Ref.

Descriptors: *Acid-base equilibrium, *Fish physiology, *Carp, *Carbon dioxide, Water chemistry, Electrolytes, Ions, Potassium, Sodium, Chlorine, Bicarbonates, Hydrogen ion concentration, Animal metabolism, Biochemistry, *Buffers, *Tissue analysis.

In a series of experiments on carp subjected to high C02 levels, changes were determined in inorganic ion exchange (HC03-, C1-, K+, Na+, Ca2(+) and Mg2(+)) as the acid-base balance shifted in the presence of excess C02. A study was made of the dynamics of these ions, their distribution in tissues, and their elimination. It was established that while the concentration of a given ion (HC03-, C1-) changes, there is a decline in the concentration of bases as a result of their removal from tissues and bone, and perhaps an increase in the reabsorption of some elements by the kidneys. (Deal-EIS)

CHANGES IN THE PHYSIOLOGICAL PROCESSES OF AQUATIC ORGANISMS UNDER THE INFLUENCE OF A CONSTANT MAGNETIC FIELD,
Institute of Biology of Southern Seas, Sevastopol (USSR).
A. I. Taneyeva.
Hydrobiological Journal, Vol 14, No 5, p 48-54, 1978. 1 Fig, 5 Tab, 24 Ref.

Descriptors: *Growth rates, *Brine shrimp, *Magnetic studies, Animal physiology, Larval growth stage, Crustaceans, Oxygen requirements, Copepods, Animal metabolism, Respiration, Length, Weight, *Magnetic fields.

A uniform magnetic field speeds the hatching and growth of larvae of A. salina, but depresses oxygen absorption in growing crustaceans. There is less dry weight per unit of length in larvae emerging in a magnetic field that in those growing outside a magnetic field. At different intensities of the magnetic field, the 'magnetic sensitivity' of the animals is stronger in a uniform field than in a non-uniform one. An increase in the water content in the bodies of the crustacea changes their 'magnetic sensitivity'. (Deal-EIS)

KINETICS OF ACCUMULATION OF SOME RADIONUCLIDES BY MARINE BACTERIA,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
G. G. Polikarpov, A. Y. Zesenko, and A. V. Parkhomenko.
Hydrobiological Journal, Vol 14, No 5, p 67-72, 1978. 5 Fig, 13 Ref.

Descriptors: *Radioisotopes, *Sorption, *Aquatic bacteria, Cesium radioisotopes, Strontium radioisotopes, Potassium radioisotopes, Zinc radioisotopes, Bacteria, Filters, Chemical properties, Radiochemical analysis, Tracers, *Bioaccumulation, *Calcium radioisotopes.

Sorption of 137Cs, 90Sr, 32P and 45Ca on membrane filters and kinetics of their accumulation in Bacterium halophilum and B. album were studied. Sorption of the first three elements proved to depend on the dry mass of the filters. No such a dependence was observed for 45Ca. The radionuclides accumulated in B. halophilum at concentration factors (per unit dry mass of bacteria) of the order of tens (137Cs), hundreds (65Zn) and tens of thousands (32P) units. Kinetics of 137Cs, 90Sr, 45Ca, 65Zn and 32P accumulation by B. halophilum culture were traced in the course of its development in a closed volume, as were the kinetics of accumulation and excretion of 137Cs by cells of a resting B. album culture. Equilibrium accumulation of 137Cs by cells of a resting culture of B. album is achieved in 90 minutes after the start of the experiment, and half of this nuclide is excreted in 40 minutes. (Deal-EIS)

BASELINE STUDY OF THE LEVEL OF CONCENTRATION OF MERCURY IN THE FOOD FISHES OF BAY OF BENGAL, ARABIAN SEA AND INDIAN OCEAN,
Marine Products Export Development Authority, Cochin (India). Inspection Lab.
V. D. Ramamurthy.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 11, p 1405-1407, 1979. 2 Fig, 2 Tab, 6 Ref.

Descriptors: *Mercury, *Baseline studies, *Indian Ocean, Heavy metals, Marine fish, Mollusks, Crustaceans, Sampling, Water quality, Standards, Mediterranean Sea, Atlantic Ocean, Pacific Ocean, Path of pollutants, Fish physiology, *Bay of Bengal, Arabian Sea.

Mercury levels in 18 groups of fishes including Mollusca and Crustacea were analysed. The mercury content in all the 18 groups was very low. Differential variation among different groups was also noticed where the mean average value ranges from 5 microg/kg to 65 microg/kg. The levels of concentration of mercury in some of the known food fishes of the Indian Ocean, Bay of Bengal and Arabian Sea have been compared with similar species found in the Mediterranean, Atlantic and Pacific Oceans. It was observed that the mercury content in Mediterranean and Atlantic Ocean species is 2-4 times that of the Indian Ocean species. The present values were also compared with permissible levels of mercury content of different countries. (Deal-EIS)

ROLES OF FOOD AND SEA WATER IN THE ACCUMULATION OF RADIONUCLIDES BY MARINE FISH,
National Inst. of Radiological Sciences, Nakaminato (Japan). Div. of Marine Radioecology.
Y. Suzuki, M. Nakahara, R. Nakamura, and T. Ueda.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 11, p 1409-1416, 1979. 3 Fig, 8 Tab, 16 Ref.

Descriptors: *Radioisotopes, *Absorption, *Marine fish, Cesium radioisotopes, Zinc radioisotopes, Cobalt radioisotopes, Strontium radioisotopes, Radiochemical analysis, Tracers, Path of pollutants, Fish physiology, Animal metabolism, Water chemistry, Fish food organisms, *Bioaccumulation, *Tissue analysis, *Yellowtail, *Seriola, *Manganese radioisotopes, *Praseodymium radioisotopes, *Rhodium radioisotopes, *Ruthenium radioisotopes.

In the present work yellowtail were labelled by multiple radioisotopes (144Ce-144Pr, 106Ru-106Rh, 85Sr, 137Cs, 54Mn, 65An and 60Co) through water and food, and the radioactivity of each tracer in the tissues or organs of the fish was determined by simultaneous measurement with a Ge (Li) spectrometer. Somewhat different distribution patterns of radionuclides were found in the whole bodies of the fish at the maximum accumulation with the difference in pathways. The results showed that (1) food rather than water supplied most of the 65Zn and 54Mn accumulated by fish, (2) 85Sr and 106Ru-106Rh were mainly accumulated via water and (3) the two pathways played almost the same role in the accumulation of 137Cs, 60Co and 144Ce-144Pr. Therefore, it is necessary to take into account these results for estimation of the extent of radioactive contamination in fish under natural marine ecosystem. (Deal-EIS)

ACCUMULATION AND EXCRETION OF COBALT-60 TAKEN UP FROM SEAWATER BY MARINE FISHES,
National Institute of Radiological Sciences, Nakaminato (Japan). Div. of Marine Radioecology.
M. Nakahara, S. Hirano, T. Ishii, and T. Koyanagi.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 11, p 1423-1428, 1979. 2 Fig, 4 Tab, 12 Ref.

Descriptors: *Cobalt radioisotopes, *Absorption, *Marine fish, Animal metabolism, Fish physiology, Radiochemical analysis, Path of pollutants, Tracers, Sea water, Nuclear powerplants, *Bioaccumulation, *Tissue analysis.

The accumulation and excretion of 60Co taken up from seawater were observed using marine fishes to examine the radioactive pollution of marine organisms. Blood was a good reserving pool of the nuclide in the fishes. It accumulated more than 15% of the radioactivity in the whole body of the fishes reared for about 90 days in the uptake experiment. Only liver and kidney showed higher radioactivity per unit weight than blood, in the tissues and organs, and muscle showed the lowest concentration of the nuclide. The biological half-lives in muscle of sea bream, yellowtail and flounder at 15C were calculated as 38.5, 53.3 and 63.0 days, respectively. The steady state concentration factors of muscle by direct uptake of 60Co from seawater were estimated in the range from 0.3 to 1.5 among the fishes in the experiments. (Deal-EIS)

DEGRADATION OF THE CRUDE OIL BY ARTHROBACTER SP. (IN JAPANESE),
Kobe Univ. of Mercantile Marine (Japan). Research Inst. of Marine Cargo Transportation.
M. Hirayama, and S. Nagata.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 11, p 1443-1447, 1979. 7 Fig, 15 Ref, (English Summary).

Descriptors: *Microbial degradation, *Oil, Biodegradation, Metabolism, Bacteria, Aquatic bacteria, Aromatic compounds, Chemical reactions, Chemical properties, Biochemistry, Gas chromatography, *Arthrobacter, *Crude oil.

The degradation experiment of Kuwait crude oil was carried out by using an Arthrobacter sp. strain isolated from the marine environment. From the total weight changes of oil the largest degradation period was found out to be during the first three days. From 6 to 9 days' incubation, the amount of aliphatic hydrocarbon components in crude oil decreased satisfactorily, but for polycyclic aromatic polar compounds the reverse trend was observed, i.e., increment. Such an experimental result might be considered to be the extracellular production of polar compounds produced from the metabolism of aliphatic hydrocarbon substrates. For the aromatic hydrocarbons, the ring cleavage was suggested for monocyclic ones. The bicyclic ones didn't appear to proceed such a reaction path, i.e., only occurrence of degradation for the branched alkyl chains attached to the aromatic ring. The biodegradation percentage of n-alkanes was estimated to be about 87% from the GLC analysis, but only 45% degradation was totally observed through the analysis of weight changes. These results indicate that the aliphatic hydrocarbons other than n-alkanes might be resistant to degradation by this strain. (Deal-EIS)

LONG-TERM EFFECTS OF WATER-SOLUBLE FRACTIONS OF KUWAIT CRUDE OIL ON THE LARVAL AND JUVENILE DEVELOPMENT OF THE MUD CRAB EURYPANOPEUS DEPRESSUS,
Delaware Univ., Lewes. Marine Studies Complex.
T. L. Cucci, and C. E. Epifanio.
Marine Biology, Vol 55, p 215-220, 1979. 5 Tab, 20 Ref.

Descriptors: *Toxicity, *Oil, *Crabs, *Growth stages, Larval growth stage, Growth rates, Crustaceans, Bioassay, Mortality, Mode of Action, Animal physiology, Animal metabolism, *Crude oil, Kuwait crude.

Larvae of the mud crab were reared in various concentrations of the water-soluble fraction of Kuwait crude oil. The 48-h TLm (median tolerance limit) for Zoea Stage I was approximately 10 ppm total dissolved hydrocarbons and that for Zoea Stage II approximately 17 ppm. Chronic toxicity of more dilute solutions (4.3 and 8.7 ppm) was assessed independently for each larval stage and for subsequent developmental stages through Crab Stage 5. In the group continuously exposed to oil from hatching, there was differential mortality relative to controls in every larval stage and increased duration of intermolt periods was observed at every stage through Crab Stage 5. Mortality in groups not exposed until larvae had reached Zoea Stages III or IV was not greater than controls, suggesting that toxicity to advanced larval stages may be related to accumulation of toxic compounds by the larvae. Neither concentration (4.3 or 8.7 ppm) of crude oil caused increased mortality among juvenile crab stages regardless of the time of initial exposure. Increased occurrence of an extra and morphologically abnormal megalopa stage was associated with exposure to the crude oil. This has not been reported before. (Deal-EIS)

MERCURY CONTENTS OF ZOOPLANKTON COLLECTED IN THE TROPICAL PACIFIC OCEAN,
Kumamato Univ., (Japan). Aitsu Marine Biological Station.
R. Hirota, M. Fujiki, and S. Tajima.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 11, p 1449-1451, 1979. 1 Fig, 1 Tab, 9 Ref.

Descriptors: *Mercury, *Zooplankton, *Pacific Ocean, Baseline studies, Heavy metals, Water quality standards, Monitoring, Sampling, Spectrophotometry, Chemical analysis, Japan, *Tissue analysis, *Bioaccumulation, *Methylmercury.

The mercury contents of zooplankton collected at eight stations in the Tropical Pacific Ocean were measured to obtain data as a standard for an unpolluted sea. Mercury values ranged from 0.0188 to 0.1248 ppm with a mean of 0.0575 ppm. The mercury contents measured in this survey were lower

than those of zooplankton collected in the inland sea regions of Japanese, American and European estuaries, and in the oceanic area between Hawaii and California, USA. Such results seem to suggest that the Tropical Pacific Ocean is relatively uncontaminated with mercury. (Deal-EIS)

SURVIVAL OF JUVENILE SPOT (LEIOSTOMUS XANTHURUS) EXPOSED TO BROMOCHLORINATED AND CHLORINATED SEWAGE IN ESTUARINE WATERS,
Virginia Inst. of Marine Sciences, Gloucester Point.
M. H. Roberts, Jr.
Marine Environmental Research, Vol 3, p 63-80, 1980. 4 Fig, 3 Tab, 30 Ref.

Descriptors: *Sewage effluents, *Toxicity, *Marine fish, Sewage treatment, Chlorination, Halogens, Bromine, Bioassay, Disinfection, Fish physiology, Juvenile growth stage, Virginia, James River(Virginia), *Spot, *Leiostomus, Newport News.

The acute toxicity of chlorinated and bromochlorinated treated sewage waste was determined with spot, Leiostomus xanthurus. The halogenated sewage waste was generated in a pilot plant located at the James River Sewage Treatment Plant, Newport News, Va. The 96h and 144h LC50's were 0.23 mg/l (measured residual) for chlorine and 0.25 mg/l (measured residual) for bromine chloride. These concentrations are considerably higher than those which would be produced by optimal halogenation rates for disinfection or maximum superhalogenation rates permitted by pilot plant equipment and normal effluent dilution rates. TRIAZINE RESIDUES IN SUSPENDED SOLIDS (1974-1976) AND WATER (1977) FROM THE MOUTHS OF CANADIAN STREAMS FLOWING INTO THE GREAT LAKES,
Ontario Ministry of Agriculture and Food, Guelph (Ontario). Pesticide Residue Lab.
R. Frank, G. J. Sirons, R. L. Thomas, and K. McMillan.
Journal of Great Lakes Research, Vol 5, No 2, p 131-138, 1979. 1 Fig, 5 Tab, 20 Ref.

Descriptors: *Triazine pesticides, *Suspended solids, *Runoff, *Water chemistry, *Great Lakes region, *Canada, Sampling, Chemical analysis, Pollutants, Pollutant identification, Water pollution, Water quality, Rivers, Streams, Pesticides, Organic pesticides, Organic compounds, Atrazine, Desethylatrazine, Simazine.

Forty-five suspended solids collected during 1974 and 1976 from 12 streams on the Canadian side of the Great Lakes contained no detectable residues of triazines to a limit of 0.05 microgram/gram. Of 92 stream waters sampled in July 1977, 77% contained atrazine, 52% desethylatrazine, and 28% simazine above a detectable level of 0.03 microgram/liter. Mean concentrations of these three triazines in the 92 streams were 1.6, 0.3, and 0.2 microgram/liter, respectively. The highest mean triazine residue occurred in those stream waters entering Lake Erie (4.0 microgram/liter); there was little difference in the mean concentrations of waters entering Lakes Ontario (1.1 microgram/liter), St. Clair (1.3 microgram/liter), and Huron (1.4 microgram/liter). While triazine herbicides were found entering the Great Lakes, there was no threat to water quality as defined by the objectives of the International Joint Commission. (Sims-ISWS)

VOLATILE CHLORO- AND CHLOROFLUOROCARBONS IN LAKE ERIE--1977 AND 1978,
National Water Research Inst., Burlington (Ontario).
K. L. E. Kaiser, and I. Valdmanis.
Journal of Great Lakes Research, Vol 5, No 2, p 160-169, 1979. 5 Fig, 3 Tab, 26 Ref.

Descriptors: *Pollutants, *Water chemistry, *Sampling, *Chemical analysis, *Lake Erie, On-site data collections, Pollutant identification, Chemicals, Analytical techniques, Data processing, Correlation analysis, Chlorofluorocarbons, Chlorocarbons, Freon, Chloroform, Carbon tetrachloride, Trichloroethylene.

Water samples from the central and eastern basins of Lake Erie were analyzed for volatile chloro- and chlorofluorocarbons for a one-week period in each of 1977 and 1978. The following contaminants were observed with mean concentrations and standard deviations in 1978 with the corresponding values for 1977 in parentheses: dichlorodifluoromethane (Freon 12) 76 + or - 38 (73 + or - 36) nanograms/liter; trichlorofluoromethane (Freon 11) 34 + or - 26 (46 + or - 40) nanograms/liter; chloroform 15 + or - 4 nanograms/liter; carbon tetrachloride 19 + or - 11 (37 + or - 20) nanograms/liter; trichloroethylene 20 + or - 13 (11 + or - 9) nanograms/liter. Except for carbon tetrachloride and trichloroethylene, the distribution patterns appear to show little correlation with each other. Chloroform concentrations were relatively uniform, however, the carbon tetrachloride and trichloroethylene concentrations appear to be point-source related with discharges along the south shore of Lake Erie. Freon 12 concentrations were generally higher in the eastern basin than in the central basin, while Freon 11 levels were high and relatively uniform throughout the study area. (Sims-ISWS)

WATER-QUALITY ASSESSMENT OF RATTLESNAKE CREEK WATERSHED, OHIO,
Geological Survey, Columbus, OH. Water Resources Div.
K. F. Evans, and R. L. Tobin.
Geological Survey Water-Resources Investigations 79-17 (open-file report), April 1979. 28 p, 4 Fig, 11 Tab, 19 Ref.

Descriptors: *Water quality, *Surface waters, *Watersheds(Basins), *Ohio, *Water analysis, Sampling, Sites, Chemical analysis, Nutrients, Bacteria, Dissolved oxygen, Pesticides, Evaluation, *Rattlesnake Creek watershed(Ohio).

Chemical and biological water quality in Rattlesnake Creek basin, Ohio, are evaluated. The data include field and laboratory data for eight sites during August 1976-August 1977 and summaries of earlier (1972-76) data. Streamflow was below normal during the study period. Basin waters types were calcium bicarbonate or calcium magnesium bicarbonate. Specific conductance ranged from 405 to 1,300 micromhos per centimeter. High concentrations of sodium (110-140 mg/l), nitrogen (24 mg/l as N), and phosphorus (7.8 mg/l as P) were observed during low flows downstream from domestic sewage facilities. Nonpoint sources contributed high concentrations of nitrate-nitrogen to all streams during the high flows of winter and spring. Dissolved-oxygen concentrations in the upper basin ranged from 3.2 to 18.4 mg/l. Mean saturation values of dissolved oxygen were at or near 100 percent in the lower basin. Stream pH exceeded 8.4 when dissolved-oxygen saturation was above 120 percent. Bacteria and invertebrate data suggest that moderate pollution from cultural sources may exist in the upper basin. Water quality was poorest in the sluggish flows of the upper basin but improved downstream. Increases in flow velocity and stream aeration rates, dilution, and biological activity contributed to the downstream recovery. Except for high nitrogen concentrations, water quality was best in the lower basin. (Kosco-USGS)

PHOSPHORUS CYCLING IN THE CREEPING SWAMP FLOODPLAIN ECOSYSTEM AND EXPORTS FROM THE CREEPING SWAMP WATERSHED,
North Carolina Univ. at Chapel Hill.
L. A. Yarbro.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-156227, Price codes: A11 in paper copy, A01 in microfiche. PhD dissertation, (Curriculum in Ecology), December 1979. 231 p, 25 Fig, 31 Tab, 241 Ref. OWRT B-084-NC(6) and B-110-NC(2), 14-31-0001-5100, 14-34-0001-8105.

Descriptors: *Phosphorus cycling, Nutrient budget, Floodplains, Fluxes, Phosphorus retention, *Wetlands, Swamps, Ecosystems, Inflow, Discharge(Water), Phosphorus, Watersheds(Basins), *North Carolina, *Creeping Swamp(NC), Coastal plains.

Measurement of fluxes to and from a freshwater floodplain swamp ecosystem, Creeping Swamp, N.C. and from the surrounding watershed in a North Carolina coastal plain, demonstrated that the swamp floodplain and watershed budget indicated that imports and exports from fertilization and crop harvesting overwhelmed natural imports in precipitation, and exports in surface waters. The lowland location of the swamp floodplain ecosystem regulated the amount and form of phosphorus leaving the watershed in surface waters. Annual rates of exchange of filterable forms of phosphorus are extremely large compared to inputs and available stocks. This suggests that estimations are gross rather than net rates of exchange which was confirmed by comparisons of radiophosphorus-32 dynamics with changes in stable forms of phosphorus.

THE ENVIRONMENTAL TRANSPORT OF LEAD AND CADMIUM,
Delaware Univ., Newark. Dept. of Civil Engineering.
T. L. Willis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158033. Price codes: A08 in paper copy, A01 in microfiche. Master's Thesis, June 1978. 165 p, 24 Fig, 12 Tab, 101 Ref, 1 Append. OWRT B-018-DEL(1), 14-34-0001-8070.

Descriptors: *Cadmium, *Lead, *Delaware, *Air pollution, *Fallout, Water pollution, Rainfall, Surface runoff, Aerosols, Sampling, Spectrophotometry, Water pollution sources, Christina River.

Rainwater samples from five sites in or around the Christina River Basin near Newark, Delaware.

were collected and analyzed to study the transport of lead and cadmium in the area. Two possible sources of the pollutants in streamwater were tested to determine whether the lead and cadmium came from urban runoff of street pollutants from Newark or whether they came from atmospheric cleansing of aerosol pollutants by dry fallout and rainout. Metals analyses of all samples were carried out by flameless atomic absorption using a Jarrel-Ash Model 810 Atomic Absorption Unit. Lead analyses were performed at 2170A and cadmium analyses at 2288A. Most samples were analyzed for total metals while some were also analyzed for soluble metals and rainwater pH. Data on stream sediments and soil samples were also collected. Results indicated that the lead and cadmium found in streamwater came from atmospheric emissions. Two mechanisms were active in removing these elements from the atmosphere. During dry months dry fallout of lead and cadmium particles accumulated and were then washed off by the next rainstorm. During wet months the lead and cadmium were removed from the atmosphere by direct rainout and were then directly transported into the stream with runoff. Atmospheric lead concentrations were linked to traffic flow levels while atmospheric cadmium was found to have an industrial source. The stability of the metals in the soil system of the area was also examined. (Seigler-IPA)

ORGANIC CARBON EXPORT FROM UPLAND AND FORESTED WETLAND WATERSHEDS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
P. J. Mulholland, and E. J. Kuenzler.
Limnology and Oceanography, Vol 24, No 5, p 960-966, 1979. OWRT-B-084-NC(4), 14-31-0001-5100.

Descriptors: Carbon export, Watersheds(Basins), *Swamps, Swamp drainage, Forest drainage, Runoff, Evapotranspiration, *Forest watersheds, *Drainage, *Carbon, *Wetlands, Organic compounds, North Carolina, Canada, Massachusetts, New Hampshire, British Columbia.

Export of organic carbon per unit runoff from five small eastern North Carolina watersheds with considerable swamp drainage was severalfold higher than the export rates from upland watersheds. This reflects the higher concentrations of organic carbon, especially dissolved forms, in swamp waters and is probably attributable to increased contact time between water and organic debris as well as to concentration effects of high evapotranspiration in swamps.

STORM TRAVEL DISTANCE CALCULATIONS FOR TOTAL PHOSPHORUS AND SUSPENDED MATERIALS IN RIVERS,
West Virginia Univ., Morgantown. Dept. of Chemical Engineering.
F. H. Verhoff, D. A. Melfi, and S. M. Yaksich.
Water Resources Research, Vol 15, No 6, p 1354-1360, December 1979. 8 Fig, 13 Ref.

Descriptors: *Phosphorus, *Suspended solids, *Storm runoff, *Model studies, Mathematical models, On-site investigations, Sampling, Rivers, Water pollution, Path of pollutants, Nutrients, Hydrographs, Runoff, Storms, Pollutants, Chemicals.

From previous work it appeared that total phosphorus is transported through rivers by a series of storm events. This paper presents a method for calculating the average distance of travel during any given storm event. The method uses the hydrograph, chemograph, and flow characteristics at a point in the river. Comparisons were made between storm events at the same station in a river, between different stations in the same river basin, and between stations in different rivers. Results showed the distance of travel is dependent upon the magnitude and duration of the storm event but not on the magnitude of the total phosphorus concentration. (Sims-ISWS)

The physical, chemical, and biological water quality characteristics of Ross Bay, monitored during the period July 1974-May 1975, were described. The benthic macroinvertebrate standing crop of the littoral zone was sampled quantitatively during July 1974. The results were described in terms of biomass distribution and the distribution of taxa. The sampling stations were placed in an ordinal series based on their respective pollutional status. Changes in community structure and taxonomic composition along the series were described in terms of species diversity and the distribution of 'indicator' organisms. Based on this distribution, a scheme of biotic indices was devised in order to reduce complex community composition to simple numerical terms. For this purpose, individual organisms were given a water quality rating which is dependent on their relative tolerance or intolerance to pollution. Significant correlation was shown between the ordinal series, water quality, Diversity Index values, Community Similarity values, and Biotic Quality values. The biological evaluation of water quality in lakes was discussed, and it was suggested that the littoral benthos may serve in any future assessment of organic pollution and enrichment in Lough Leane. HYDRAULIC EVALUATION OF A MOUND SYSTEM IN MAINE,
Maine Univ. at Orono.
K. R. Marston.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158199, Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, May 1979. 70 p, 22 Fig, 2 Tab, 29 Ref. OWRT A-040-ME(3).

Descriptors: *Septic tanks, *Sewage effluents, *Waste disposal, Path of pollutants, Monitoring, Subsurface flow, Mound systems, Evaluation, Alternative sewage disposal systems, On-site waste disposal systems.

Since 1974 mound systems have been an acceptable alternative for private sewage disposal in Maine. To data, there has been little information on the success or failure or on the relative performance of mounds as they are used in Maine. The objective of this research was to obtain data concerning the movement of septic tank effluent into and through the mound to help in evaluating the performance of mound systems in Maine. Well points were used to evaluate the distribution of applied effluent to the absorption trench and a neutron moisture probe was used to determine its movement through the sand fill. The test mound was monitored for a seven month period from June, 1977 to January, 1978. The 4-inch diameter pipe used in the mound did not provide uniform distribution of septic tank effluent along the length of the absorption trench. A clogged layer had formed on the bottom of the trench toward the inlet end of the distribution pipe causing effluent to pond. Below the clogged layer (that portion of the trench with ponded effluent) infiltrating effluent flowed vertically through a zone of unsaturated sand fill and then laterally through a saturated zone at the original soil surface until it was absorbed into the more slowly permeable subsoil. At no time was effluent observed seeping out of the toe of the mound on the ground surface.

OPTIMIZED ECONOMIC USE OF SLUDGE TREATMENT FACILITIES IN DURBAN,
Durban City Engineer's Dept. (South Africa).
I. E. Everitt.
Journal of the Water Pollution Control Federation, Vol 51, No 3, p 494-498, March 1979. 1 Tab, 2 Ref.

Descriptors: *Optimization, *Waste water treatment, *Sludge treatment, *Costs, *Durban(South Africa), Operations research, Sludge disposal, Operating costs, Operation and maintenance, Facilities, Equipment, Capital costs, Construction costs, Filtration, Heat treatment, Economics, Cost comparisons, Economic efficiency, Africa, South Africa.

Four wastewater treatment plants in Durban, South Africa utilize several types of specialized sludge treatment units for conditioning, dewatering and disposal. Detailed descriptions are given of the technical operations of various kinds of equipment in use, including thickeners and best treatment for

sludge conditioning, centrifuging and filter plate presses for sludge dewatering, and incinerating and subsequent disposal of digested and heat-treated sludge. Thickening and centrifuging are newer treatment alternatives developed through experiences gained in modifying and evaluating plant operation. Cost comparisons of the various processes used in Durban indicates that operating costs vary widely when full use is not made of a unit (for example, if an ancillary boiler is manned 24 hr/day but is operated only a portion of that time). Capital costs of the 21 tons/day thickeners in 1976 were R240,000 (1 R = $1.147). The 1 ton/hr centrifuge unit cost in the same year was R110,000. The 1971 costs for the 950 kg/hr multiple-hearth furnace was R250,000. (Harris-Wisconsin)

MERCURY INTERACTION IN CRAYFISH ANTENNAL GLAND AND HEPATOPANCREAS,
Boise State Univ., ID.
R. W. Ellis, and E. G. Fuller.
Journal of Invertebrate Pathology, Vol 34, p 308-309, 1979. 4 Fig.

Descriptors: *Mercury, *Toxicity, *Crayfish, Proteins, Biochemistry, Heavy metals, Animal metabolism, Spectrophotometry, Animal physiology, Cytological studies, Invertebrates, *Tissue analysis, *Bioaccumulation, *Metallothionein.

Mercury and other heavy metals have been shown to accumulate in several aquatic invertebrates. In this study four crayfish (Pasifastacus leniusculus) were exposed for 2 days to 2.5 ppm of Hg2+. The supernatants from homogenates of antennal gland and hepatopancreas were fractionated on Sephadex G-100 columns and analyzed for Hg with an atomic absorption spectrophotometer. Mercury was present in the soluble protein fraction of the antennal gland, but not in the hepatopancreas. Two fractions from the antennal gland contained Hg2+. One, representing proteins of 100,000 to 80,000 molecular weight, contained (0.18 + or - 0.02 microg (Hg)/ml fraction) and (0.28 + or - 0.02 mg (Protein)/ml fraction) and the other, representing proteins of 15,000 to 9,000 molecular weight, contained (0.30 + or - 0.05 microg (Hg)/ml fraction) and (0.02 + or - 0.005 mg (protein)/ml fraction.) This suggests that the second fraction contains a heavy metal binding protein such as metallothionein, since all reports of this protein show it to fall within this molecular weight range. Histological changes in the structures studied are also discussed. (Deal-EIS)

STUDIES ON CHEMOTHERAPY OF FISH DISEASES WITH PIROMIDIC ACID--I. ABSORPTION, DISTRIBUTION, EXCRETION AND TOXICITY OF PIROMIDIC ACID IN SOME SPECIES OF FISHES,
Dainippon Pharmaceutical Co. Ltd. (Japan) Research Lab.
H. Katae, K. Kouno, S. Morikawa, F. Tashiro, and S. Takahashi.
Fish Pathology, Vol 14, No 2, p 79-92, 1979. 1 Fig, 13 Tab, 5 Ref.

Descriptors: *Chemical properties, *Pesticides, *Fish diseases, Aquiculture, Chemical analysis, Pesticide kinetics, Pesticide residues, Absorption, Toxicity, Bioassay, Salmonids, Eels, Fish physiology, Animal metabolism, *Tissue analysis, *Ayu, *Plecoglossus, Piromidic acid, Anguilla, Pacific salmon, Oncorhynchus.

The pharmacokinetic and toxicological effects of piromidic acid (PA, 8-ethyl-5, 8-dihydro-5-oxo-2-pyrrolidinopyrido(2,3-d)pyrimidine-6-carboxylic acid) were studied in ayu Plecoglossus altivelis, amago salmon Oncorhynchus rhodurus and eels Anguilla japonica and A. anguilla. The absorption, distribution and excretion data obtained from the bioassay revealed that orally administered PA was easily absorbed and quickly became distributed in blood and major organs. Peak levels were reached in 3h (in ayu) or 6-24h (in amago salmon) after the administration of PA, followed by a gradual decrease. The levels of PA in liver and kidney were higher than in blood and plasma. In the acute toxicity study, the LD50 value for ayu was more than 2,000 mg/kg. The subacute toxicity of PA was studied in ayu (80 mg/kg), amago salmon (800 mg/kg) and eels (400 mg/kg) administered PA once daily for 5-10 days. Except for accidental death of two eels, all fishes receiving PA survived without any clinical and histopathological changes. Dissapearance of PA from the tissues in amago salmon was studied after the administration of 40 mg/kg PA for 7 consecutive days. Peak levels of PA in the tissues tested were attained within 6-12 h following administration. A level below the assay limits (0.25-0.56 ug/ml or g) was reached 96h post-dosing. No evidence of long term residue was found in any of the tissues tested. (Deal-EIS)

Water Resources Research, Vol 15, No 6, p 1313-1322, December 1979. 2 Fig, 5 Tab, 34 Ref. OWRT C-7047(No 6221)(8), 14-34-0001-6221.

Descriptors: *Water quality, *Water pollution sources, *Management, *Optimization, *Ohio, Model studies, Watersheds(Basins), Erosion, Soil erosion, Phosphorus, Nutrients, Biochemical oxygen demand, Dissolved oxygen, Land use, Planning, Water pollution, Pollutants, Path of pollutants, Water pollution treatment, Land resources.

A multiobjective planning framework for a river basin that considers both point and nonpoint source pollutants was presented. The need for an integrated approach to pollution abatement originating from these two sources was discussed in the light of Public Law 92-500. The need for including multiple objective functions in their noncommensurable formats and units was also discussed. Two broad-based planning objectives considered were economic development and environmental quality. The environmental quality model included the following multiple objectives: (1) soil erosion, (2) phosphorus, (3) biological oxygen demanding load in the stream. Noninferior solutions and trade-offs among the objectives were examined for several alternative planning scenarios using the surrogate worth trade-off (SWT) method. The decision-maker's role in obtaining the basin-wide plan was discussed. Finally, the planning framework was applied to the Maumee River Basin study. (Sims-ISWS)

ANALYTICAL SOLUTION OF A VELOCITY DEPENDENT DISPERSION PROBLEM,
Princeton Univ., NJ. Dept. of Civil Engineering.
D. H. Tang, and D. K. Babu.
Water Resources Research, Vol 15, No 6, p 1471-1478, December 1979. 7 Fig, 8 Ref, 3 Append. NSF-ENG-76-18957, NSF-ENG-78-24413.

Descriptors: *Dispersion, *Wells, *Injection wells, Steady flow, Porous media, Groundwater, Hydrology, Equations, Velocity, Path of pollutants, *Well hydraulics, Dispersion coefficient.

A complete description of the convective-dispersive transport of a contaminant from an injection well requires consideration of a velocity dependent dispersion coefficient. An analytical solution of this equation for steady fluid flow conditions can be obtained. The solution is significantly different from existing approximate analytical solutions. A numerical solution to this problem converges to the new analytical solution upon refinement of the finite difference net. (Lee-ISWS)

A NOTE ON DIFFUSION FROM A CONTINUOUS LINE SOURCE IN A TIME VARYING FLOW,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
R. E. Wilson.
Water Resources Research, Vol 15, No 6, p 1636-1638, December 1979. 1 Fig, 2 Ref.

Descriptors: *Diffusion, *Unsteady flow, *Model studies, Mathematical models, Currents(Water), Tidal waters, Dispersion, Solutes, Pollutants, Path of pollutants, Water pollution, Estuaries, Oscillating flow.

This note described approximate techniques for calculating the transient concentration field resulting from horizontal diffusion from a continuous source in a time varying flow. Using these techniques, calculations could be performed either by hand or very economically by machine. The analyses were based on a model for two-dimensional horizontal diffusion in which the field for a continuous source is represented as the superposition of the fields for instantaneous patches; the spread of an instantaneous patch is characterized by a diffusion velocity. The specific case considered was an oscillating flow characteristic of a tidal estuary, but the techniques should be of practical value in the description of concentration fields of passive quantities introduced into a variety of time varying flows. NON-POINT SOURCE POLLUTION FROM ABANDONED AGRICULTURAL LAND IN THE GREAT LAKES BASIN,
Michigan State Univ. East Lansing. Dept. of Crop and Soil Sciences.
T. M. Burton, and J. E. Hook.
Journal of Great Lakes Research, Vol 5, No 2, p 99-104, 1979. 3 Tab, 21 Ref. EPA R005143-01.

Descriptors: *Water pollution sources, *Agricultural watersheds, *Great Lakes region, Sampling, Nutrients, Nitrogen, Nitrogen compounds, Phosphorus, Phosphorus compounds, Calcium, Sodium, Chlorine, Suspended solids, Runoff, Agricultural runoff, Pollutants, Water pollution, Path of pollutants, *Abandoned agricultural land, Non-pointed water pollution sources.

The contribution of abandoned farm fields to non-point source pollution in the Great Lakes Basin was studied on a 7.73 ha old field watershed near East Lansing, Michigan, that had been abandoned 18 years prior to the study. Exports of nitrogen were low and approached values expected for undisturbed forests in the Great Lakes Basin. Exports of phosphorus were slightly elevated compared to undisturbed forests. Exports and concentrations of both N and P were similar to values listed for cleared, unproductive land for the Great Lakes region by the recent nationwide survey of EPA. Annual exports of total P, P04-P, N03-N, N02-N, NH4-N, Organic-N, Cl, Na, Ca, and suspended solids were given. Most exports of all constituents occurred during rainfall or snow-melt generated runoff events during the spring runoff period. Soil and soil-water nutrient concentrations were low, reflecting the low fertility of the study watershed. Nutrient concentrations in runoff reflect this low fertility and would be higher from recently abandoned farm land. The contribution of abandoned fields to nutrient loading of the Great Lakes would decrease from levels typical of agricultural runoff at time of abandonment to levels typical of undisturbed forests within 15 to 20 years following abandonment. (Sims-ISWS)

PHOSPHATE CHARACTERISTICS AND BIOAVAILABILITY OF SUSPENDED SEDIMENTS FROM STREAMS DRAINING INTO LAKE ERIE,
Ohio State Univ., Columbus.
T. J. Logan, T. O. Oloya, and S. M. Yaksich.
Journal of Great Lakes Research, Vol 5, No 2, p 112-123, 1979. 2 Fig, 3 Tab, 28 Ref.

Descriptors: *Suspended solids, *Phosphorus, *Nutrients, *Lake Erie, Streams, Rivers, Sampling, Chemical analysis, Analytical techniques, Watersheds(Basins), Water chemistry, Pollutants, Water pollution, Biology, Sediments, Path of pollutants, Bioavailable phosphorus.

Suspended sediments from major U.S. tributaries draining into Lake Erie were analyzed for phosphorus. Analyses included: sediment concentration, reactive and total filtered P, and total P on water samples. Recovered sediment total P was determined by perchloric and persulfate extraction. Sediment was fractionated for NaOH-P citrate-dithionite-bicarbonate (CDB)-P, HCl-P, and organic P. New York streams had the highest suspended solids and the lowest content of most sediment fractions except HCl-P. NaOH-P and CDB-P were highest in sediments from Ohio tributaries; these fractions are considered to be bioavailable with NaOH-P more available than CDB-P. Digestion with perchloric acid consistently removed more P than the persulfate method. The difference in the two methods was negatively correlated with HCl-P. (Sims-ISWS)

PHOSPHORUS LOADING ASSOCIATED WITH HOUSING IN A RURAL WATERSHED,
Department of Agriculture, Harrow (Ontario). Research Station.
J. D. Gaynor.
Journal of Great Lakes Research, Vol 5, No 2, p 124-130, 1979. 2 Fig, 5 Tab, 19 Ref.

Descriptors: *Phosphorus, *Bioindicators, *Domestic wastes, *Agricultural watersheds, Rural areas, Drainage, Runoff, Watersheds(Basins), Pollutants, Water pollution, Bacteria, Coliforms, Sampling, Instrumentation, Chemical analysis, Water chemistry, Water pollution sources, Housing effects.

Phosphorus and biological indicator organisms were measured in a rural watershed to quantify housing and agricultural inputs to the drainage system. Total-P and orthophosphate-P (P04-P) were significantly higher downstream from intensive housing areas than at areas with lower housing density. Housing areas discharged 40% particulate-P and 53% P04-P, while rural areas discharged 62 and 29%, respectively. On the average, rural housing contributed 2 g P/house/day which comprised 27% of the P04-P discharged from the study area. For the rural subwatersheds, phosphorus from agriculture was not differentiated from biogeochemical and precipitation inputs. Assuming all phosphorus arose from fertilizer application, total-P losses represented 3.5% of that applied, while P04-P losses represented less than 1%. It was concluded that housing in rural areas contributes P04-P to nutrient enrichment of drainage systems and that measures to control rural erosion may reduce total-P load but increase the proportion of P04-P. (Sims-ISWS)

APPLICATION OF SHORT-TIME SCALE RECORDING METER DATA TO NUMERICAL MODELLING OF TORONTO HARBOUR,
Ontario Ministry of the Environment, Toronto.
D. J. Poulton.
Journal of Great Lakes Research, Vol 5, No 2, p 144-152, 1979. 10 Fig, 1 Tab, 15 Ref.

Descriptors: *Harbors, *Water circulation, *Water quality, *Canada, *Model studies, Currents(Water), Water chemistry, Temperature, Water temperature, Conductivity, Hydrogen ion concentration, Dissolved oxygen, Dissolved solids, Winds, Sampling, Analytical techniques, *Toronto Harbour.

One of the major difficulties in time-dependent numerical modeling of Great Lakes harbors is providing adequate data to describe the variation of waste discharges and open boundaries at short-time intervals (order of minutes). Short-time scale data for currents, winds, and total dissolved solids (as measured by conductivity) have been obtained at 10-minute intervals by digital recording automated equipment located at fixed points representing major discharges and connecting channels to Lake Ontario. These data have been entered directly into a two-dimensional hydrodynamic and water quality model of Toronto Harbour. The model outputs for time periods of up to 96 h were presented in the form of vector plots of currents and contour maps of water quality. The output was validated by comparison with independent short-time scale currents and water quality data measured at an interior point within the harbor, using methods of direct plotting and least-squares analysis. It is expected that refinement of physical variables in the model and measurement of verification data at closer intervals (1 or 2 min) will improve the extent of model verification. Such a model is expected to be a powerful tool in predicting the response of water bodies to management policies such as loading changes and alteration of harbor geometry. (Sims-ISWS)

EASTERN GULF OF MEXICO MARINE HABITAT STUDY. VOLUME I.
Woodward-Clyde Consultants, Orange, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 152, Price codes: A06 in paper copy, A01 in microfiche. Final Report to Bureau of Land Management, January 1979. 111 p, 3 Fig, 2 Tab, 2 Append. AA551-CT8-22.

Descriptors: *Baseline studies, *Gulf of Mexico, *Florida, *Habitats, *Resources development, Environmental effects, Ecology, Water pollution sources, On-site investigations, Oil pollution, Leases, Oil fields, *Outer Continental Shelf, Environmental impact.

The primary objective of the Eastern Gulf of Mexico Marine Habitat Study was to identify and delineate marine habitat areas in 49 of the proposed lease blocks included in OCS Sale No. 65. The

lease blocks are located offshore Florida in the Gulf of Mexico. The 49 blocks were divided into 10 non-contiguous map areas for the purposes of discussion and data presentation. The ground truth and geophysical data were reviewed to identify potentially critical marine habitat areas where further studies may be desired prior to initiation of any offshore operations that could affect the marine habitat. The majority of the areas studied have a 'soft bottom'. Most of the biotic activity is associated with the soft bottom which varies considerably in character and biotic productivity. The soft bottom areas represent a prime resource and must be considered in proper perspective before any judgements about the ecological and economic impacts of the lease sale can be made. (See also W80-04077) (Sinha-OEIS)

EFFECTS OF LANDFILL LEACHING ON WATER QUALITY AND BIOLOGY OF A NEARBY STREAM, SOUTH CAIRO, GREENE COUNTY, NEW YORK,
Geological Survey, Albany, NY. Water Resources Div.
T. A. Ehlke.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-300 776, Price codes: A02 in paper copy, A01 in microfiche. Geological Survey, Water-Resources Investigations 79-13, 1979. 18 p, 2 Fig, 3 Tab, 11 Ref.

Descriptors: *Landfills, *Leachate, *Infiltration, *Water quality, *Waste disposal, *Biology, Streamflow, New York, Reach(Streams), Analytical techniques, Chemical analysis, Documentation, Observation wells, Sampling, Data collections, Groundwater, Surface waters, Benthic fauna, Invertebrates, Aquatic populations, Microorganisms, Inflow, Heavy metals, Algae, Bacteria, Path of pollutants, *Greene County(NY), Bell Brook.

A 1-kilometer stream reach receiving leachate-enriched water from a small municipal landfill in Greene County, N.Y., was studied from 1971-75 to document streamflow rates and chemical quality of the stream and ground water. The distribution of benthic invertebrates and microorganisms in the stream above the landfill was markedly different from that below it; the difference is attributed to the inflow of leachate. The Trichoptera, Ephemeroptera, and Nematomorpha have been eliminated from the reach adjacent to and below the landfill and have been replaced by large numbers of Tendipedidae and Niadidae. Certain chemical constituents, especially iron and manganese, were extremely concentrated in the ground water immediately beneath the streambed. The elevated concentrations of these and other metals may be the direct cause of the abrupt faunal shift. Algae were replaced by large masses of the iron bacterium Leptothrix in the stream reach below the landfill. (Kosco-USGS)

STATISTICAL ANALYSIS OF NITRATE CONCENTRATIONS FROM THE RIVER FROME (DORSET) FOR THE PERIOD 1965-76,
Freshwater Biological Association, Wareham (England). River Lab.
H. Casey, and R. T. Clarke.
Freshwater Biology, Vol 9, No 2, p 91-97, April 1979. 6 Fig, 7 Tab, 15 Ref.

Descriptors: *Nitrates, *River Frome(UK), United Kingdom, *Statistics, Statistical methods, Regression analysis, Discharge(Water), Correlation analysis, Seasonal, Annual, Cycling nutrients, River flow.

Model predictions for 1976 nitrate concentrations (mean 3.37 mg) in the River Frome, England, based on 11 years (1965-1975) weekly data of nitrate concentrations and discharge values, were very close to the 3.44 mg observed mean nitrate concentrations. 1976 results showed 1.5 mg nitrate minimum concentration in August, followed by 7.24 mg concentration only seven weeks later. The model poorly fit seasonal 1976 variation due to a dry preceding winter, summer drought until September, and heavy rainfall in early winter. Data from 1965-1975 showed weekly mean peaks in early February, low values in summer and high values in winter, following a cosine wave. 84% of yearly mean variation is explained by a linear regression on time. A 0.107 regression coefficient estimates average annual increase in nitrate concentration between 1965-1975. No overall trend occurred in flow rates over the years, although mean annual 1966-1968 flows were significantly higher than other years. Although discharge closely relates to seasonal nitrate variation when based on weekly data averaged over several years, individual discharges and nitrate concentrations relate less closely because both vary considerably and independently over one week. Nitrate was determined by the phenol disulphonic acid method. (Danovich-Wisconsin)
W80-04101

CCE-M VALUES OF NATURAL AND RECHARGED GROUNDWATERS,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
K. L. Knickerbocker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-160856, Price codes: A05 in paper copy, A01 in microfiche. M.S. Report, 1976. 68 p, 6 Fig, 8 Tab, 31 Ref. OWRT A-067-ARIZ(2), 14-34-0001-6003.

Descriptors: *Water quality, *Groundwater, *Waste water(Pollution), *Reclaimed water, *Groundwater recharge, Organic compounds, Trace elements, Dissolved solids, Public health, Water wells, Potable water, Standards, CCE-m, Groundwater organics, Wastewater recharge, Groundwater quality.

The total organic content or recharged secondary effluents as measured by the miniaturized carbon chloroform extract method (CCE-m) was investigated by analyzing waters from wells located at various distances from recharge areas. It was found that the CCE-m organic concentration decreased with increasing percolation distance. Secondary activated sludge effluent was found to contain 3.80 mg/l CCE-m. Percolation through 100 feet of porous media reduced the CCE-m value to less than 0.50 mg/l. This is less than the E.P.A. proposed 1974 Drinking Water Standard of 0.70 mg/l. Fourteen wells located a minimum of 1,000 feet from an ephemeral stream receiving secondary effluent had CCE-m values less than 0.20 mg/l. A general survey of deep wells known not to receive any wastewater recharge found CCE-m values varying from 0.04 to 0.30 mg/l. It is probable that the oil lubrication methods employed in deep wells resulted in these CCE-m values.
W80-04110

SEASONAL VARIATION IN THE POPULATIONS OF MOINA MACROCOPA STRAUSS AND MOINA MICRURA KURZ (CRUSTACEA: CLADOCERA) IN ZOAFARANIYAH POOLS,
Biological Research Centre, Baghdad (Iraq).
A. N. Khalaf, and A. F. Shihab.
Hydrobiologia, Vol 62, No 1, p 75-77, January 1979. 2 Tab, 9 Ref.

Descriptors: *Crustaceans, *Seasonal, *Population dynamics, *Reproduction, *Zoafaraniyah pools, Iraq, Invertebrates, Population, Water temperature, Temperature, Physiochemical properties, Speciation, Animal behavior, Animal physiology, Animal metabolism, Life history studies, Life cycles, On-site investigations.

A clear difference exists between two cladoceran species in Zoafaraniyah pools, Iraq, as measured in July 1976-June 1977; Moina macrocopa has one developmental cycle, whereas Moina micrura has a cicyclic development. Both species reach a maximum in October when temperatures are 22-28.5C. M. macrocopa density reaches 11,815/l. During winter months population density gradually declines to 73/l in December. M. micrura population peaks in October and April, amounting to 13,125/l and 11,000/l, respectively. Both species completely disappear in January when temperatures are 4-9C. However, M. micrura occurs in the field five to six months earlier than M. macrocopa does. Reproduction does not occur for either species in July, indicating a response to high temperatures. M. macrocopa reproduction takes place September-December while M. micrura reproduction occurs March-July and August-December. (Danovich-Wisconsin)

CONSUMER REGULATION OF NUTRIENT CYCLING,
Wisconsin Univ., Madison, Lab. of Limnology.
J. F. Kitchell, R. V. O'Neill, D. Webb, G. W. Gallepp, and S. M. Bartell.
BioScience, Vol 29, No 1, p 28-34, January 1979. 5 Fig, 2 Tab, 82 Ref. NSF AG-199, ERDA BMS 76-00761.

Descriptors: *Cycling nutrients, *Secondary productivity, *Translocation, *Animal behavior, *Food habits, Nutrients, Ecosystems, Distribution, Vertical migration, Fish, Biomass, Insects, Biological communities, Sediment-water interfaces, Mixing, Energy budget, Food chains, Cycles, Aquatic productivity, Predation, Zooplankton.

Nutrient-cycling rates in ecosystems are altered by translocation and transformation which result from consumer organism behavior and consumption processes. Consumers have been simply represented as components in energy-flow patterns; however, they substantially influence nutrient cycling through physical/chemical processes, mainly by translocation and transformation. Consumer translocation is an important ecosystem-level process because animal mobility and behavior affect nutrient redistribution across subsystem boundaries. Diel vertical migration by zooplankton causes rapid nutrient translocation. In aquatic systems, fish represent the most mobile form of phosphorus and concentrate the mineral four-fold over other biomass pools. Nutrient cycling due to biological distrubance at sediment-water interfaces is great because massive phosphorus pools are stored in sediments. Over time, consumers transform the surface/volume relationship of their prey community or food substrate in ways that alter nutrient cycling processes. In aquatic ecosystems, selective predation alters the size spectrum of particles. The keystone role of soil arthropods in litter transformation involves comminution, or reduction in particle size. In decomposing tree boles, channelization by termites, ants and beetles, significantly transforms physical/chemical processes. Small units are also aggregated such as in macroarthropod feces or fish biomass, resulting in nutrient conservation. (Danovich-Wisconsin)

flow, Lake Huron, Great Lakes, Gulfs, Inlets, Eutrophication, Sounds, Vollenweider models, Mixing, Advection, Nutrient loading, Nutrients, Nutrient transport, Mathematical models, Turbulence, Nutrient budgets.

Most phosphorus loading models have been applied to lakes where advection through river outlets is the predominant form of mass transport out of the system. This paper develops a simple loading model for bays which can be considered as completely mixed systems when a turbulent mass transport term is added to a nutrient budget equation. The model is demonstrated for use with Saginaw Bay, Lake Huron. A method is devised to incorporate turbulent diffusion into loading plots by adjusting loading terms to include phosphorus flux from Lake Huron into the bay and including turbulent flow effects in residence time. Physical and chemical data for the system (Saginaw Bay, its tributaries and Lake Huron) as measured during 1974-76 are utilized in an equation to yield a bulk diffusion coefficient. Calculation of total phosphorus concentration requires an estimate of apparent settling velocity, estimated here at 12.4 m/yr as derived from phosphorus budget data from a number of other lakes. On the basis of calculations employing the suggested model, a total phosphorus budget is given: of an estimated 1,443 t/yr coming into the bay from direct loadings and tributaries, 38% is incorporated into the sediments, 16% leaves by advection, and 46% leaves by turbulent mixing; thus, inclusion of the turbulent mixing process in the loading model accounts for nearly half the phosphorus outflow from Saginaw Bay. DISTRIBUTION OF POLLUTANTS FROM A NEW PAPER PLANT IN SOUTHERN LAKE CHAMPLAIN, VERMONT AND NEW YORK,
Michigan Univ., Ann Arbor. Dept. of Natural Resources.
D. L. Mason, D. W. Folger, R. S. Haupt, R. R. McGirr, and W. H. Hoyt.
Environmental Geology, Vol 1, No 6, p 341-347, May 1977. 3 Fig, 2 Tab, 23 Ref.

Descriptors: *Lake Champlain, *Pulp and paper industry, *Pollutant identification, *Pulp wastes, *Sediments, Pollutants, Suspended load, Suspended solids, Sediment discharge, Water pollution sources, Water pollution treatment, Lake beds, Phosphorus, Wood wastes, Organic wastes, Carbon, Kaolinite, Organic loading, Water pollution effects.

Water column and bottom sediments collected November 1973-May 1974 near the outfall of a new paper plant located on Lake Champlain's western shore and opened in June 1971 contained measurable quantities of components derived from the pulp and paper mill despite extensive treatment to reduce such pollutants. Recovered detritus and near-bottom sediments were analyzed for materials used in paper manufacturing, such as kaolinite (paper filler), anatase (paper whitener), organic carbon (derived from wood fibers) and phosphorus (added in treatment processes). As much as 2.3 cm of sediment accumulated during the six-month monitoring period near the new mill outfall whereas less than 1 cm accumulated in all other areas sampled. Kaolinite/chlorite values in trap sediments were highest (1.4%) at the plant outfall as well as anatase concentrations (0.8%). Organic carbon concentrations were highest in both traps (8.7%) and bottom sediments (4.2%) near the mill outfall. Similarly, extractable phosphorus concentrations in trap sediments (254 micro g/g) and bottom sediments (127 micro g/g) were highest near the outfall. All values for these components remained high 1.5-6 km to the north. Values were significantly lower in most other areas sampled in southern Lake Champlain. Extensive primary and secondary waste treatment facilities including tanks, lagoons and clarifers were constructed to process the 62,000 cu m daily wastewater discharge; however, additional effluent treatment is still necessary. (Danovich-Wisconsin)

PLANNING FOR NONPOINT POLLUTION CONTROL IN NORTH CAROLINA,
Soil Conservation Service, Raleigh, NC.
L. A. Brown.
Journal of Soil and Water Conservation, Vol 34, No 1, p 8-10, January-February 1979. 2 Tab, 5 Ref.

Descriptors: *North Carolina, *Nonpoint pollution, *Planning, *Agricultural runoff, *Erosion control, *Federal Water Pollution Control Act Amendments of 1972, Erosion, Water quality, Soil erosion, Water pollution, Water pollution sources, Water pollution control, Soil conservation, Costs, Erosion rates, Farms, Agriculture, Soil management, Federal Water Pollution Control Act.

Responsibility for nonpoint pollution control program planning on agricultural land in North Carolina was delegated to the Soil and Water Conservation Commission, which coordinates the Agricultural 208 Planning Group. The 208 Planning Group developed a three-phase study plan. As part of Phase I, a statewide inventory of erosion was conducted for different land uses. During Phase II, sub-basins with high pollution potential were investigated to determine which nonpoint pollutants were present, their source and the best management practices (BMPs) needed to control them. Phase III involved continued study and monitoring of two priority sub-basins. Highest erosion rates occur on surface mines, sanitary landfills, construction sites and shorelines; however, almost two-thirds of the state soil loss occurs from cropland. The highest sediment delivery rates occur in the Piedmont and mountain state areas. Almost half of the erosion occurs on 2.3 million acres of high water erosion hazard cropland. This means that over 36 million tons of the state's annual soil loss of 79 million tons comes from 7.4% of the land. The proposed multi-year program includes BMPs to reduce erosion on cropland to 5 tons/acre/yr. Installing and maintaining these BMPs will cost an estimated $281 million as of October 1978. On-site costs of installing these practices average $75/acre. North Carolina landowners now spend $9 million/yr to install erosion and sediment control practices. Even with active cost-sharing government programs, less than half the needed $28 million/yr is being provided. (Danovich-Wisconsin)

ORGANIC CARBON CYCLING IN A SWAMP-STREAM ECOSYSTEM AND EXPORT BY STREAMS IN EASTERN NORTH CAROLINA,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
P. J. Mulholland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-160658, Price codes: A08 in paper copy, A01 in microfiche. Ph.D Dissertation, 1979. 152 p, 31 Fig, 37 Tab. OWRT B-084-NC(5) and B-110-NC(1), 14-31-0001-5100, 14-34-0001-8105.

Descriptors: Organic carbon concentration, Organic carbon flux, Carbon export, Organic carbon budget, Swamp ecosystem, Biological inputs, Biological outputs, Streams, Hydrologic inputs, Hydrologic outputs, Channelized streams, *Swamps, *Carbon, *Organic compounds, *Ecosystems, *North Carolina, Creeping Swamp(NC), Creeping Swamp watershed(NC), Organic carbon concentrations.

Organic carbon concentrations were monitored in 7 small N.C. streams, 4 of which had been channelized. Seasonal patterns of organic carbon concentrations were different between channelized streams and natural swamp-streams; however, there was overlap in weighted mean annual organic carbon concentrations. Major inputs, outputs and internal ecosystem flows of organic carbon cycling processes in Creeping Swamp were measured, and the annual organic carbon budget was made for 1977. Export of primarily dissolved organic carbon from Creeping Swamp varied seasonally. Annual exports from this and the other streams were linearly related to annual runoff. These exports were larger than upland watersheds probably as a result of increased contact time between ground litter and surface water and evapotranspiration in swamp ecosystems. It is hypothesized that organic carbon export is important to downstream secondary productivity, especially in estuaries. (DiNardi-NC)

MAXIMUM UTILIZATION OF WATER RESOURCES IN A PLANNED COMMUNITY: CHLORINE AND OZONE TOXICITY EVALUATION,
Rice Univ., Houston, TX. Dept. of Biology.
B. Hammond, and J. Bishop.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-131121, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-050e, August 1979. 47 p, 19 Fig, 3 Tab, 17 Ref. 802433.

Descriptors: *Chlorination, *Ozone, *Channel catfish, *Waste water treatment, Toxicity, Bioassay, Lethal limit, Fish physiology, Environmental effects, Fish toxins, Disinfection, Analytical techniques, Water pollution sources, Gills, Kidneys, The Woodlands.

Fingerling channel catfish, Ictalurus punctatus, were used in bioassays to study the effects on aquatic organisms of waste water disinfection by chlorine and/or ozone as part of an evaluation of the water resources plan for The Woodlands, a planned urban development. The Woodlands, located near Houston, Texas, is designed so that impoundments in the community that will be used for recreational fishing will receive reclaimed waste water. Both flow through and standard static bioassays were conducted and compared to determine an accurate LC50 for chlorine while a flow through bioassay alone was used for the ozone. Fish used in the study underwent cannulation and catheterization to facilitate monitoring of gill and kidney functions. Results show that the flow through bioassay for chlorine produced a lower 96 hour LC50 than did the static bioassay, with an LC50 of 0.07 mg/l chlorine for the flow through versus an LC50 of 0.45 mg/l chlorine for the static bioassay. From these values and considerations of the techniques used it is concluded that the final concentration of chlorine in receiving waters should not exceed 0.007 mg/l. Ozone was more toxic to fingerlings than chlorine with a 96 hour LC50 of 0.03 mg/l. From this value and the highly reactive nature of ozone it is concluded that if ozone can be detected either by analytical techniques or by its odor it exceeds safe environmental limits. Both disinfectants had little effect on kidney functions but both drastically reduced the ability of gills to absorb sodium from water. Long term exposure to ozone had little effect on blood pressure and heart rate while long-term chlorine exposure greatly reduced both. (Seigler-IPA)

POLYCHLORINATED BIPHENYLS: PHYTOTOXICITY, ABSORPTION AND TRANSLOCA-

TION BY PLANTS, AND INACTIVATION BY ACTIVATED CARBON,
North Carolina State Univ. at Raleigh. Dept. of Crop Science.
J. B. Weber, and E. Mrozek, Jr.
Bulletin of Environmental Contamination and Toxicology, Vol 23, p 412-417, 1979. 4 Tab, 15 Ref. OWRT-B-122-NC(1), 14-34-0001.

Descriptors: *Polychlorinated biphenyls, *Activated carbon, *Plant growth, Plant uptake, Hazardous waste, Chlorinated hydrocarbon, Toxic substance, Waste treatment, Soil absorption, Toxicity, *PBC spills, North Carolina.

A large spillage of polychlorinated biphenyls (PCBs) in North Carolina stimulated this investigation which (1) examined the effects of soil-applied PCB on soybean and fescue growth, (2) determined the amount of PCB absorbed and translocated by the 2 plant species, and (3) determined if activated carbon would inactivate PCB and prevent its uptake by plants. Results indicate that PCB applied to soil significantly inhibited height and fresh top weight of soybean plants at high application rates. Leaf malformation was also observed. Activated carbon added to the soil removed the inhibitory effects of PCB at all rates of application.

FEATURES OF THE STRUCTURE AND TROPHIC LINKS OF PLANKTONIC ASSOCIATIONS IN TWO LAKES WITH DIFFERNET DEGRESS OF SALINITY,
Akademiya Nauk SSSR, Moscow. Inst. of Limnology.
V. G. Drabkova, G. I. Letanskaya, and E. S. Makartseva.
The Soviet Journal of Ecology, Vol 9, No 1, p 68-73, January-February 1978. 4 Tab, 21 Ref.

Descriptors: *Plankton, *Lakes, *Salinity, *Trophic level, *Biomass, Phytoplankton, Bacterioplankton, Zooplankton, *USSR, Lake B. Shentropai(USSR), Decomposing organic matter, Lake Atkul(USSR), Ural Mountains(USSR), Saline water, Saline lakes, Ions, Sampling, Ecology, Ecosystems, Biodegradation, Degradation(Decomposition), Food webs.

Ecological production characteristics of phytoplankton, bacterioplankton and zooplankton were studied for two forest-steppe lakes in the southern Ural Mountains region of the USSR in Chelyabinsk Province, May-October, 1974. Plankton sampling comparative analysis shows that with increasing water salinity, impoverishment of species composition occurs for phytoplankton and zooplankton, zooplankton biomass rises sharply as compared with phytoplankton and bacterioplankton, and feeding interrelationships between these associations become more strained. Algae bacteria cannot satisfy zooplankton food requirements. Low phytoplankton and bacterioplankton biomass in a mineralized lake is caused by domination of small algae and bacteria forms. With increased salinity, zooplankton plays a greater role in organic matter decomposition. Lake Atkul' and Lake B. Shantropai, located 9 km apart, are characterized by shallow depths and high exposure; the lakes differ sharply in hydrochemical indices and above all in the total of basic ions. Zooplankton is much more important in the Lake B. Shentropai ecosystem (total ions up to 16 g/l) compared to Lake Atkul' (2.5 g/l). Moreover, its importance is almost doubled in the presence of decomposing organic matter; pressures of feeding interrelationships simultaneously increases zooplankton importance. Zooplankton biomass in Lake B. Shantropae exceeds phytoplankton biomass by more than 10 times and bacterioplankton biomass by more than four times. (Harris-Wisconsin)

STUDIES ON THE PLANT COMMUNITY OF A NORTH FLORIDA SALT MARSH PART II. NUTRITIVE VALUE AND DECOMPOSITION,
Florida Agricultural and Mechanical Univ., Tallahassee.
W. L. Kruczynski, C. B. Subrahmanyam, and S. H. Drake.
Bulletin of Marine Science, Vol 28, No 4, p 707-715, October 1978. 2 Fig, 4 Tab, 22 Ref. DOAg 416-15-15.

Descriptors: *Salt marshes, *St. Marks(FL), *Halophytes, *Spatial distribution, *Decomposing organic matter, Spartina alterniflora, Leaves, Plant physiology, Plant morphology, Biochemistry, Rhizomes, Biodegradation, Speciation, Carbohydrates, Proteins, Juncus roemerianus, Distichlis spicata, Chemical analysis, Distribution patterns, Florida.

This study summarizes zonal variations in nutritive values of live, dead and decomposing plants in tidal marshes near St. Marks, Florida September 1974-August 1975. Juncus roemerianus and Spartina alterniflora shoots and Juncus rhizomes were sampled bimonthly in each of three marsh zones: low (LM), upper (UM) and high (HM) zones. Distichlis spicata was sampled only in HM. Ash content of Juncus leaves and rhizomes decreases from LM toward HM, reflecting adaptations to soil gradients. Caloric value, lipid and protein content of live Juncus leaves are smallest in UM, indicating that nitrogen may be limiting in UM zones. Juncus rhizomes have a higher percentage of ash and carbohydrate than leaves. Spartina nutrient zonal variations are significant; leaf protein content is lowest in UM, ash content is greatest in HM. Spartina has higher ash contents than Juncus in all areas. Distichlis protein and lipid content is lower than that of either live Juncus or Spartina, while Distichlis carbohydrate is higher than both. Concentrations of Fe and B in live Juncus leaves increase from LM to HM, while concentrations of Na, Al and Mo are highest in LM leaves. Spartina concentrations of K, Al, Mo and Fe increase toward LM, while Mg increases toward HM. Concentrations of most amino acids are greatest in LM and lowest in UM plants. Juncus annual decomposition is 70% in LM and UM and 30% in HM; Spartina litterbags loose 80-89% of weight at all marsh sites. (Danovich-Wisconsin)

ENVIRONMENTAL ASPECTS OF OCEAN DUMPING IN THE WESTERN GULF OF MEXICO,
Texas A and M Univ., College Station.
E. Atlas, J. Brooks, J. Trefry, T. Sauer, and C. Schwab.
Journal of the Water Pollution Control Federation, Vol 52, p 329-350, 1980. 13 Fig, 10 Tab, 33 Ref.

Descriptors: *Sewage sludge, *Sewage disposal, *Gulf of Mexico, Chemical properties, Biodegradation, Microbial degradation, Bacteria, Industrial wastes, Chemical wastes, Heavy metals, Organic compounds, Productivity, Toxicity, Phytoplankton, Turbidity, Water chemistry, Waste disposal, Oceans.

Field and laboratory studies were conducted of an ocean-dumped waste containing biological sludge from a chemical biotreatment plant. During July 1977, a test dump was monitored to study the chemical behavior and dispersal of waste at a deep-water dumpsite in the western Gulf of Mexico. Nearly 100 organic compounds were detected in the waste, and some heavy metals were measured in significant amounts. At the diluted levels usually encountered in the ocean, adverse effects of such a waste on phytoplankton productivity would not be measurable with the techniques used. Increased turbidity and chemical residues could not be measured in the field past 24 hours. (Deal-EIS)

HEAT RESISTANCE OF CELLS OF UPPER SUBLITTORAL BIVALVE MOLLUSKS OF SANDY INFAUNA IN PETER THE GREAT BAY (SEA OF JAPAN),
Akademiya Nauk SSSR, Vladivostok. Inst. Morskogo Biologii.
V. S. Vasil'eva.
The Soviet Journal of Marine Biology, Vol 4, No 1, p 523-526, 1978. 1 Fig, 1 Tab, 8 Ref.

Descriptors: *Mollusks, *Heat resistance, *Water temperature, *Bills, *Sea of Japan, Peter the Great Bay(USSR), Animal physiology, Benthic fauna, Spatial distribution, Thermal stratification, Adaptation, Toxicity, Cytological studies.

The author determines the heat resistance of eight species of bivalve mollusks of sandy infauna of the upper sublittoral of Peter the Great Bay (USSR). Specifically, the heat resistance of cells of ciliated epithelium of mollusk gills was examined. As is the case in bottom invertebrates of epifauna, the differences in heat resistance of species of infauna mollusks are in conformance with their vertical and geographical distribution and their environmental temperatures. THE BACTERIAL FLORA OF CERTAIN MARINE FISHES AND PRAWNS IN COCHIN WATERS IN RELATION TO THEIR ENVIRONS,
Central Inst. of Fisheries Technology, Cochin (India).
T. C. Karthiayani, and K. M. Iyer.
Journal of the Marine Biological Association of India, Vol 17, No 1, p 96-100, 1975. 2 Tab, 10 Ref.

Descriptors: *Marine bacteria, *Spatial distribution, *Tissue analysis, *Achromobacter, *Vibrio, *Prawns, *Sardines, *India, Pseudomonas, Bacteria, Cultures, Chemical analysis, Cytological studies, Bottom sediments, Lobsters, Seasonal, Depth, Biological communities.

Commercially important fishes like sardines, prawns, lobster and seer fish caught off Cochin, sea water samples gathered from different depths (surface, middle and bottom) and bottom mud were subjected to bacteriological analysis. Qualitatively the predominant organisms found associated with these marine animals were the gram negative, asporogenous, rod-like bacilli of the genera Pseudomonas, Achromobacter and Vibrio. Sea water and bottom mud samples also showed a predominance of gram negative rods, though with considerable variation in generic composition with depth. Quantitatively the 'bacterial density' of the sea water increased with depth, the highest aerobic count being shown by bottom mud and the least by surface water up to 14 meters depth. Compared to bottom mud, a 10 to 100 fold increase in the bacterial count was observed on the body of the fishes in general and a higher increase (10 to the third power to 10 to the fourth power fold) at the gills and the highest (10 to the fourth power to 10 to the fifth power fold in the guts of sardines have been constantly recorded. The significance of the observation has been discussed in relation to the keeping quality of the fish. (Deal-EIS)

EFFECT OF HEXACHLORAN ON OXYGEN CONSUMPTION OF NEOGOBIUS MELANOSTOMUS AND NEOGOBIUS FLUVIATILIS,
Odessa State Univ. (USSR). Dept. of Hydrobiology.
F. C. Zambriborshch, and B. I. Ai
The Soviet Journal of Marine Biology, Vol 4, No 1, p 526-529, 1978. 4 Fig, 4 Tab, 8 Ref.

Descriptors: *Oxygen requirements, *Fish physiology, *Pesticide toxicity, *Hexachloran, *Neogobius, Respiration, Animal metabolism, Chemical analysis, Oxygen, Chlorinated hydrocarbon pesticides, Fish populations, Water pollution effects

The effect of hexachloran on oxygen consumption of Neogobius melanostomus and N. fluviatilis is investigated. The investigation shows that this pesticide in concentrations lower than the maximum permitted (0.006-0.012 mg/liter) affects respiration and intensifies the 'group effect' in oxygen consumption. The ability to restore respiration disrupted by the pesticide was the same in these fishes. Those poisoned by hexachloran in concentrations of 0.006 and 0.012 mg/liter were unable to restore oxygen consumption to normal for a period of up to no less than three days. (Deal-EIS)

DDE-CONTAMINATED FISH OFF LOS ANGELES ARE SUSPECTED CAUSE IN DEATHS OF CAPTIVE MARINE BIRDS,
Southern California Coastal Water Research Project, El Segundo, CA.
D. R. Young, T. C. Heesen, G. N. Esra, and E. B. Howard.
Bulletin of Environmental Contamination and Toxicology, Vol 21, p 584-590, 1979. 3 Tab, 12 Ref.

Descriptors: *Pesticide toxicity, *DDT, *Mortality, *Cormorants, *Tissue analysis, Gulls, Pesticide residues, Chlorinated hydrocarbon pesticides, Path of pollutants, Food chains, *DDE, Polychlorinated biphenyls, Gas chromatography, California, Los Angeles Zoo.

During the spring of 1976, nearly the entire collections of Brandt's cormorants (Phalacrocorax penicillatus), guanay cormorants (P. bougainvillii), and California gulls (Larus californicus) in the Los Angeles Zoo died after exhibiting signs of pesticide poisoning. In view of the extensive DDT pollution which has occurred in the coastal waters off southern California, we conducted a limited investigation to determine if this pollutant could have been the cause of death for these specimens of marine birds. The study revealed that concentrations of DDT residues in the specimens were within the range that had been found to be lethal to American kestrels in laboratory feeding studies. The zoo birds apparently were exposed to high levels of these residues when they were fed marine fish collected near Los Angeles. (Deal-EIS)

HAEMATOLOGICAL ASSESSMENT OF THE EFFECTS OF THE ANAESTHETIC MS222 IN NATURAL AND NEUTRALIZED FORM IN THREE FRESHWATER FISH SPECIES: INTRASPECIES DIFFERENCES,
Randse Afrikaanse Univ., Johannesburg (South Africa). Dept. of Zoology.
G. L. Smit, J. Hattingh, and A. P. Burger.
Journal of Fish Biology, Vol 15, p 645-653, 1979. 4 Tab, 11 Ref.

Descriptors: *Toxicity, *Fish physiology, *Organic compounds, Carp, Rainbow trout, Freshwater fish, Acids, Hydrogen ion concentration, Animal metabolism, Acid-base equilibrium, Mode of action, Chemical properties, *MS222, *Anaesthetics, *Fish anaesthetics, *Sarotherodon, *Blood chemistry, *Tissue analysis

The effects of different concentrations of natural MS222 and neutralized MS222 were studied on the haematology of Cyprinus carpio, Sarotherodon mossambicus and Salmo gairdneri. As judged from the results, MS222, which is acidic in nature, produced haemoconcentration effects in all species studied, being least in the trout followed by carp and Sarotherodon mossambicus. These differences are ascribed to acid-base regulatory functions and metabolic activities of the fish species investigated. The use of neutralized MS222 improved the haematological profiles markedly and resulted in stabilization of acid-base parameters and red blood cells sizes and numbers. Haemoconcentration effects, however, still persisted. Trout were found to be more susceptible to the stress of MS222 anaesthesia than carp and Sarotherodon mossambicus. (Deal-EIS)
W80-03989

HAEMATOLOGICAL ASSESSMENT OF THE EFFECTS OF THE ANAESTHETIC MS222 IN NATURAL AND NEUTRALIZED FORM IN THREE FRESHWATER FISH SPECIES: INTERSPECIES DIFFERENCES,
Randse Afrikaanse Univ., Johannesburg (South Africa). Dept. of Zoology.
G. L. Smit, J. Hattingh, and A. P. Burger.
Journal of Fish Biology, Vol 15, p 633-643, 1979. 6 Tab, 18 Ref.

Descriptors: *Toxicity, *Fish physiology, *Organic compounds, Carp, Rainbow trout, Freshwater fish, Chemical properties, Mode of action, Animal metabolism, Fish management, *Sarotherodon, *MS222, *Anaesthetics, *Fish anaesthetics, *Tissue analysis, *Blood chemistry.

Interspecies haematological differences to MS222 and neutralized MS222 anaesthesia were investigated in Sarotherodon mossambicus. Cyprinus carpio and Salmo gairdneri acclimated under identical laboratory conditions. Anaesthesia with MS222 resulted in a 'chemical stress' in all fish, as was evident from changes in the haematological profiles of the animals. Such species specific variations in the haematology persisted throughout the whole experiment protocol which employed different concentrations of the anaesthetic. The use of neutralized MS222, whereby aquarium water quality remained unchanged, improved the haematological profile. Possible reasons for the interspecies differences observed are discussed. EFFECTS OF NONSETTLEABLE BIOSOLIDS ON STREAM ORGANISMS,
Academy of Natural Sciences, Philadelphia, PA.
S. L. Friant, R. Patrick, and L. A. Lyons.
Journal of the Water Pollution Control Federation, Vol 52, p 351-363, 1980. 5 Fig, 10 Tab, 11 Ref.

Descriptors: *Secondary treatment, *Sewage effluents, *Toxicity, *Aquatic life, *Streams, Suspended solids, Waste treatment, Domestic wastes, Industrial wastes, Bacteria, Chlorophyta, Protozoa, Scenedesmus, Susquehanna River, Pulp wastes, Pulp and paper industry.

Experiments were conducted to determine whether organic, nonsettleable solids that result from secondary treatment of domestic and industrial wastes are deleterious to aquatic life in a stream. These solids are very slowly settleable; in laboratory experiments at 10 mg/l they did not alter by 10% the light penetration at wavelengths of 600 and 700 nm. They did not seem to increase the bacterial count in a stream that has the characteristics of the Susquehanna River water. There was no definite stimulatory effect on the green alga, Scenedesmus abundans. Bacteria and particulates composing the nonsettleable solids were a satisfactory food source for Paramecium aurelia. DDT-INDUCED CHANGES IN THE ACTIVITY OF THE PHOTOSYNTHETIC SYSTEM OF AQUATIC PLANTS,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
T. I. Shokod'ko, A. I. Merezhko, and M. V. Malinovskaya.
Hydrobiological Journal, Vol 14, No 5, p 75-78, 1978. 1 Fig, 2 Tab, 11 Ref.

Descriptors: *DDT, *Toxicity, *Photosynthesis, *Aquatic plants, Pesticide toxicity, Mode of action, Chlorinated hydrocarbon pesticides, Inhibition, Chlorophyll, Metabolism, Plant physiology, *Pondweed, *Potamogeton, *Hornwort, *Ceratophyllum.

A study of the effects of DDT on aquatic plants (e.g., the pondweed Potamogeton perfoliatus L. and the hornwort Ceratophyllum demersum L.) showed that even the smallest concentrations of this pesticide inhibited photosynthesis. With increasing DDT concentration, the contents of chlorophylls and carotenoids decreased (though to a lesser extent than the rate of light-induced ferricyanide reduction), as did oxygen evolution. The processes associated with C02 assimilation were inhibited. In plants with a high chlorophyll content (pondweed), the photochemical activity (PCA) per unit weight of this pigment is lower than in species with low chlorophyll content (hornwort). (Deal-EIS)
W80-03998

ACUTE TOXICITY OF SOME EXPERIMENTAL ROAD SURFACING COMPOUNDS TO DAPHNIA PULEX,
Washington State Univ., Pullman. Dept. of Civil and Environmental Engineering.
G. C. Bailey.
Bulletin of Environmental Contamination and Toxicology, Vol 21, p 618-623, 1979. 4 Tab, 4 Ref.

Descriptors: *Toxicity, *Daphnia, *Highway icing, *Deicers, Paving, Road construction, Melting, Snow removal, Bioassay, Asphalt, Salts, Chemical analysis, Mortality, Leachate, Chemical properties.

The many damages caused by the use of salt for road deicing have prompted the development of several experimental chemical compounds. These compounds are potential contaminants of surface waters through runoff from prepared road surfaces. To assess the potential environmental hazard of these compounds bioassays were performed using Daphnia pulex. The 06-H LC50 was determined for eight experimental compounds. (Deal-EIS)

SOME BIOCHEMICAL CONSTITUENTS OF STAGE I AND II NAUPLII OF BALANUS BALANOIDES (L.) AND THE EFFECT OF ANOXIA ON STAGE I,
Dunstaffnage Marine Research Lab., Oban (Scotland).
Y. Achituv, J. Blackstock, M. Barnes, and H. Barnes.
Journal of Experimental Marine Biology, and Ecology, Vol 42, p 1-12, 1980. 5 Tab, 34 Ref.

Descriptors: *Enzymes, *Metabolism, *Mollusks, *Anaerobic conditions, Dissolved oxygen, Oxygen requirements, Proteins, Lipids, Biochemistry, Aerobic conditions, Growth stages, Animal physiology, Energy conversion, *Barnacles, *Tissue analysis.

Some aspects of the energy-yielding metabolism of early larval stages of Balanus balanoides have been investigated by comparison of the concentrations of some biochemical constituents and certain enzyme activities in newly hatched stage I nauplii, stage I nauplii maintained for 4 h under anaerobic conditions, and stage II nauplii obtained after allowing stage I to remain in sea water in aerobic conditions for 24 h. The mean dry weight per nauplius was 1.02 microg for stage I and 0.78 microg for stage II under aerobic conditions and it is thought that the main contribution to this weight loss is from protein (and some lipid) metabolized in order to maintain the vigorous swimming of the non-feeding stage I nauplius. Carbohydrate and free amino-acid concentrations and the activity of malate dehydrogenase, lactate dehydrogenase, and fructose-1,6-diphosphate aldolase were similar in stage I and stage II. Protein, and to a lesser extent lipid, remain the major substrates used under anaerobic conditions but the decreases in these could not be accounted for by increases in metabolic intermediate compounds. A small increase in lactate and succinate may possibly account for the small amount of carbohydrate utilized under anaerobic conditions. The results are discussed in terms of current knowledge of the metabolism of invertebrates with particular reference to the effect of anaerobiosis. (Deal-EIS)

ON THE RESISTANCE OF ISOLATED BIVALVE GILL PIECES TO OXYGEN DEFICIENCY AND HYDROGEN SULPHIDE,
Sao Paulo Univ. (Brazil). Dept. de Fisiologia Geral.
K. Hiroki.
Boletim de Fisiologia Animal, Vol 1, p 9-20, 1977. 3 Fig, 4 Tab, 19 Ref.

Descriptors: *Lethal limit, *Oxygen requirements, *Animal physiology, *Mollusks, *Tissue analysis, *Anomalocardia, *Iphigenia, *Perna, *Gills, *Brazil, Hydrogen sulfide, Toxicity, Water chemistry, Animal metabolism, Sea water, Chemical analysis, Habitats, Intertidal areas, Littoral.

The lethal limits (LT50) of isolated gill pieces of three bivalve species commonly found in the Brazilian coastal waters, both in low oxygen concentration and in simultaneous presence of hydrogen sulfide, were determined. Anomalocardia brasiliana and Iphigenia brasiliensis inhabit the intertidal zone and Perna perna the sublittoral fringe. Anomalocardia brasiliana was the most resistant species in both experimental conditions, followed by Perna perna and Iphigenia brasiliensis. The survival times were longer in oxygen deficient sea water than in the presence of hydrogen sulphide. Correlation between the LT50 values and the species habitats was observed. (Deal-EIS)

INDICATION OF ANTHROPOGENIC EUTROFICATION IN LAKE LADOGA,
Akademiya Nauk SSSR, Leningrad. Inst. Ozerovedeniya.
I. I. Nikolayev, and N. A. Petrova.
Hydrobiological Journal, Vol 14, No 5, p 1-6, 1978. 5 Tab, 23 Ref.

Descriptors: *Lakes, *Trophic level, *Phytoplankton, *Zooplankton, Dominant organisms, Seasonal, Mesotrophy, Eutrophication, Productivity, Crustaceans, Rotifers, Protozoa, Biological communities, Aquatic populations, Biomass, USSR, Lake Ladoga.

A comparison of data on the present planktonic community in Lake Ladoga with data from studies done at the beginning of the century and in the 1960s shows that although the species distribution in phyto- and zooplankton communities has in general remained stable, there has been a change in the dominant species and an increase in algal concentrations. During the spring diatom bloom in the southern and eastern parts of the lake, which are the most productive, the abundance and biomass of phytoplankton now exceed by 1.5 to 5 times the maximum deviations from the mean recorded in 1960 to 1962. Zooplankton (crustaceans, rotifers and protozoans) density in the top 5 m layer of water resembles that in mesotrophic lakes. Based on chlorophyll content of plankton, Lake Ladoga is now mesotrophic. (Deal-EIS)

EXTENT AND NATURE OF THERMAL STRESS ON COPEPOD POPULATIONS,
Maryland Univ., Baltimore County, Baltimore. Dept. of Biological Sciences.
B. P. Bradley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-159924, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Center, University of Maryland, College Park, Technical Report No 56, (1979). 20 p, 2 Fig, 5 Tab, 5 Ref. OWRT A-046-MD(1), 14-34-0001-8022.

Descriptors: *Copepods, *Comparative productivity, *Temperature variations, *Temperature, Adaptation, Genetic variance, Acclimation, Egg production, Eurytemora affinis.

Among populations of the copepod Eurytemora affinis grown in three constant (10, 15, 23C) and three variable environments, more genetic adaptation occurred in a temperature regime cycling at 1 degree per day than in a regime cycling at 1 degree per week or in a very gradually increasing regime. Egg production (measured in five regimes) was lowest at 23C, highest at 10 and 15C and intermediate in the two cycling regimes. Potential for further genetic and physiological adaptation remained in all regimes suggesting that lowered reproduction at higher temperatures may retard extreme selection for temperature tolerance.
W80-04014

IMMUNE RESPONSE TO BACTERIAL IMMUNIZATION OF CHANNEL CATFISH MAINTAINED IN A RECIRCULATING WATER-REUSE SYSTEM,
Memphis State Univ., TN.
D. D. Ourth.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-160393, Price codes: A03 in paper copy, A01 in microfiche. Tennessee Water Resources Research Center, University of Tennessee, Knoxville, Research Report No 73, December 1979. 22 p, 5 Fig, 2 Tab, 22 Ref. OWRT A-056-TENN(1), 14-34-0001-9045.

Descriptors: *Channel catfish, *Commercial fish, Fish farming, Agriculture, Recirculated water, Water reuse, *Aquatic bacteria, *Bacterial immunization, Analytical techniques.

Intraperitoneal immunization of channel catfish, Ictalurus punctatus, with the Gram-negative bacterium Salmonella paratyphi in Freund's complete adjuvant produced persistant serum agglutinating antibody titers of hundreds of thousands during an immune response of about one year. Bactericidal activity of two high-titered sera averaged 30% and 20%. Post-immunization bactericidal activity varied little and remained within 10% of pre-immunization activity. The enzyme lysozyme, active against Gram-positive bacteria, was present at 1.8 ug/ml serum or 34 ng lysozyme/mg protein. Channel catfish serum can therefore provide protection against both Gram-positive and Gram-negative bacteria that the catfish may come in contact with in its aquatic environment. Channel catfish (Ictalurus punctatus) skin mucus also demonstrated an immunological function. Agglutinating antibody (titer of 1:80) and a bactericidal response to Salmonella paratyphi were found in the mucus after intraperitoneal injection of bacteria. By immunodiffusion in gel, the catfish skin mucus gave a precipitin line of identity with catfish 14S serum macroglobulin against rabbit anticatfish 14S serum indicating the presence of secretory IgM in the mucus. Parenteral immunization (intraperitoneally) can thus yield specific IgM antibody in the mucus. Lysozyme at a concentration of 183 ng/ml was demonstrated in the mucus. 8% of skin mucus cells from Wrigh-stained smears were lymphocytes which are immunocompetent cells in fish.

NUTRIENTS LIMITING PHYTOPLANKTON PRODUCTION IN ICE-COVERED LAKE ST. CLAIR,
Windsor Univ. (Ontario). Dept. of Biology.
D. G. Wallen.
Journal of Great Lakes Research, Vol 5, No 2, p 91-98, 1979. 4 Fig, 2 Tab, 38 Ref.

Descriptors: *Nutrients, *Phytoplankton, *Limiting factors, *Lakes, Sampling, Laboratory tests, Silica, Phosphates, Phosphorus, Nitrogen, Trace elements, Water pollution, Biomass, Ice cover, Winter, Limnology, Biology, Water pollution effects, *Lake St. Clair.

Nutrient enrichment experiments on ice-bound phytoplankton populations at three stations in Lake St. Clair, of the St. Lawrence Great Lakes system, showed that silica was the primary nutrient limiting phytoplankton growth and photosynthesis in the Thames River plume in mid winter. The addition of silica at concentrations of 150 micrograms/liter or greater relieved this limitation. Phosphate appeared to be a secondary limiting factor. Stations 1 and 2 below river outlets, draining rural and urban areas, showed variable results

Trace metal limitation was observed at station 1 on February 20, trace metal and vitamin limitation at station 2 in March. Possible limitation by phosphate was occasionally evidenced. (Sims-ISWS)

SHELF-SEDIMENT DYNAMICS AND SOLID-WASTE DISPOSAL,
University of Southern California, Los Angeles. Dept. of Geological Sciences.
D. S. Gorsline.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 9-16, 1979. 30 Ref. Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Dredging, *Waste disposal, *Water pollution effects, Continental shelf, Solid wastes, Sediments, Clays, Dispersion, *Outer Continental Shelf, *Ocean dumping, Dredge materials, Dump sites.

Dredged material is commonly natural material that has been deposited under riverine, estuarine or deltaic conditions. It includes natural terrigenous and biogenic detritus, organic matter and debris and adsorbed metal ions and organic compounds of natural or man-generated origins. Its dispersion is identical to dispersion for naturally contributed sedimentary materials and the particles will follow the same paths. Other than the effect of overwhelming mass dumped in a locality, the major problem environmentally is the smaller fraction of dredge spoil that contains pollutants. Since a large proportion of these contaminants is adsorbed on the clay fraction which moves as suspended load, the major environmental impact is the disposal of the fine fraction. Most harbors are located in estuaries or the lower reaches of major rivers, and so the most complex problems of control of spoil disposal are due to the inherent characteristics of estuarine circulation and particularly to the fact that estuaries are sediment traps. They typically draw from both river input and from adjacent shelves and thus the problem of finding suitable dump sites outside a given system may be economically and technically difficult. More information is needed about such problems as the rates of benthic boundary layer processes, the paths of suspended sediment transport over shelves and the net contributions of estuaries to shelves in normal and storm periods. Deep water sites should be avoided until more is known about the biology of those environments. (Sinha-OEIS)

WASTE DISPOSAL AND DREDGING ACTIVITIES: THE GEOLOGICAL PERSPECTIVE,
Johns Hopkins Univ., Baltimore, MD. Chesapeake Bay Inst.
M. G. Gross, and H. D. Palmer.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 1-7, 1979. 36 Ref. Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Dredging, *Waste disposal, *Water pollution effects, Sediments, Benthos, Environmental effects, Resources development, *Outer Continental Shelf, Ocean dumping, Dredged material, Geological effects.

Dredging and disposal of dredged materials are among the most important activities affecting estuaries and the coastal ocean in the United States. Effects of dredged material disposal on continental shelves can be appreciated only when it is realized that, except for a few major rivers, nearly all sediment transported by rivers is trapped and normally deposited in estuaries, bays, and harbors. Consequently, dredging operations are not only supplying a large quantity of waste solids but are moving them to the continental shelf where little other sediment is being deposited to dilute or bury the wastes. In areas where large volumes of materials have been dumped for an extended period, bottom-dwelling communities have been transformed substantially. The abundance of number of different types of marine organisms was substantially reduced in the waste disposal areas of the New York Bight. The presence of human pathogens in the sewage-drived constituents in many dredged materials makes ocean bottoms used for waste disposal unsuitable for production of shellfish for human consumption and less attractive for recreational fishing. Disposal of waste solids in continental shelf areas can alter bottom topography and sediment composition and texture. Therefore it is clear that dredging and disposal operations cannot be ignored and it is essential that the multiple interactions between natural agents and processes and the by-products of 'civilization' be understood. STABILITY OF DREDGED MATERIAL DEPOSITED SEAWARD OF THE COLUMBIA RIVER MOUTH,
Washington Univ., Seattle. Dept. of Oceanography.
R. W. Sternberg, J. S. Creager, J. Johnson, and W. Glassley.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 17-49, 1979. 13 Fig, 8 Tab, 23 Ref. Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Waste disposal, *Solid wastes, *Water pollution effects, *Sediments, Sediment transport, Oregon, Washington, Environmental effects, *Outer Continental Shelf, Columbia River, Dredged material, Ocean dumping.

A two-part study was conducted in a region seaward of the Columbia River where disposal of large quantities of dredged material has occurred over the last several decades. The first part included repeated bathymetric surveys and sampling for distribution and seasonal variations of sediment texture and mineral composition throughout the study area, and especially at designated disposal sites. Near-bottom hydraulic conditions (waves, tides, currents, turbidity) were also measured at several sites and during all seasons. The second part was related to an experiment in which 459,000 cubic meters of material dredged from the Columbia River estuary were discharged at a designated site, which was monitored before, during, and after disposal. Sedimentological aspects of the study were to identify and map all deposits of dredged material and to recognize seasonal and long-term changes. The objectives of the hydraulic aspects were to document ambient near-bottom conditions, and their effect on the deposit at the experimental site. Deposits of dredge material can be identified relative to the surrounding sediments, because they tend to maintain their identity for many years. Sedimentological evidence suggests that the deposits disperse northward at approximately 0.5 km per year. At the experimental disposal site the volume of the bottom deposit was 61% of the total material dumped. Calculations of bedload transport rates, based on seasonal measurements of bottom currents, suggest that 635 cubic meters of material (0.2% of the total deposit) spread northward from the site at about 0.4 km per year. This is similar to the rates determined by analysis of sediment mineralogy. (Sinha-OEIS)
W80-04065

GEOLOGIC EFFECTS OF OCEAN DUMPING ON THE NEW YORK BIGHT INNER SHELF,
Corps of Engineers, Fort Belvoir, VA.
S. J. Williams.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 51-72, 1979. 10 Fig, 2 Tab, 17 Ref. Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Waste disposal, *Water pollution effects, *Solid wastes, Sediment transport, Geology, Sewage disposal, Dispersion, Environmental effects, New York, Sludge, *Outer Continental Shelf, New York Bight, Ocean dumping.

High resolution seismic reflection records, sediment cores and deep borings, and comparison of bathymetric charts from 1845 to 1973 provide evidence that ocean dumping of assorted solid materials has significantly filled parts of the Hudson shelf channel, and is an important geologic process. Ocean disposal of natural and man-made wastes was official initiated seaward of New York Harbor in 1888 to relieve health problems, congestion and accelerated shoaling of navigation channels long associated with uncontrolled disposal within the city and adjacent waterways. Records show that about 850 million cubic meters of liquid and solid wastes have been dumped in the past 85 years. This has resulted in creation of several mounds with relief of about 15 m covering an area of about 9 thousand hectares. The calculated volume of anthropogenic solids filling the Hudson channel is 318 million cubic meters. Much of the material is similar in character to indigenous sediment. The results indicate most materials except sewage sludge are fairly stable and remain in the original dump sites. In spite of large volumes of sludge dumped at the same site since 1924, no evidence of significant accumulation on the seafloor has been found. (Sinha-OEIS)
W80-04066

MUD DEPOSITS NEAR THE NEW YORK BIGHT DUMPSITES: ORIGIN AND BEHAVIOR,
National Oceanic and Atmospheric Administration, Miami, FL. Atlantic Oceanographic and Meteorological Labs.
G. L. Freeland, D. J. P. Swift, and R. A. Young.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 73-95, 1979. 13 Fig, 1 Tab, 40 Ref, Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Waste disposal, *Water pollution effects, *Sediments, *Sediment transport, Sewage disposal, Environmental effects, New York, Mud, *Outer Continental Shelf, New York Bight, Ocean dumping, Dredged material, Dumpsites, Sewage sludge.

A detailed investigation of the floor of the New York Bight apex reveals that muddy sediment occurs in the Christiaensen Basin, in the fringing lagoons and marshes near the mouths of tidal inlets, and in ephemeral patches on the Long Island shoreface, where mud settles into the troughs of sandwave-like bedforms. The appearance and disappearance of these nearshore mud patches has led to an erroneous concept of a sewage-sludge 'front' advancing toward the Long Island beaches from the sewage-sludge dumpsite. While Bight apex mud deposits do contain sewage sludge, this contamination is usually not apparent in gross physical properties or composition; sophisticated chemical techniques are required to detect the contamination. Fine-grained deposits near the New York Bight sewage-sludge dumpsite are primarily of natural origin and should, therefore, be called mud, not sludge. Fine-grained sediment at the dredge-spoil dumpsite is also mostly natural sediment, but it is anthropogenic in that it is dredged harbor and estuary sediment. The impact of sewage-sludge dumping in the New York Bight apex depends to a large extent on the pathways and rates of natural sediment transport system. Such limited information as is available suggests that the rate of sewage-sludge dispersal is high relative to the rate of input. The model leads to the inference that sewage sludge is rapidly diluted in the Bight apex by natural sediment, and the more stable sewage-sludge components are widely dispersed through the natural mud deposits of the New York Bight system. (Sinha-OEIS)
W80-04068

CONTAINMENT OF PARTICULATE WASTES AT OPEN-WATER DISPOSAL SITES,
Yale Univ., New Haven, CT. Dept. of Geology and Geophysics.
H. J. Bokuniewicz, and R. B. Gordon.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal, p 109-129, 1979. 10 Fig, 20 Ref, Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Waste disposal, *Sediments, *Water pollution effects, Sedimentation, Environmental effects, New York, *Outer Continental Shelf, Dredged material, Ocean dumping, New York Bight, Sedimentary regimes, Biological effects.

The degree of retention of particulate silt-clay size waste at open-water disposal sites depends primarily on the sedimentary regime at the site and the height of the waste deposit. In marine localities the tidal stream will disperse waste placed in a deposit rising above natural topographic features of the bottom unless its surface is armored by erosion-resistant material or the natural sedimentation rate exceeds a critical value that depends on pile height. These factors are evaluated for dredged material disposal sites in Long Island Sound. Silt-clay is found to be dispersed at the Cornfield Point site, where the natural sedimentation rate is zero, but retained at the New Haven site, where natural sedimentation is 0.8 kgm/sq m yr). At the latter site 1.2 x 1,000,000 cu m of dredged material was placed in a conical mound 8 m high. Self-consolidation occurred over several weeks and caused an outward advection velocity of interstitial water as great as 0.00005 cm/sec. The top of the waste pile penetrates the wave-affected zone but, because it is armored with sand and clods of cohesive silt, it is not dispersed. The lower part of the waste pile is unarmored. Tidal resuspension of the neighboring muddy bottom and the waste deposit occurs every tidal cycle and is increased by as much as a factor of ten during severe storms. A layer of wastes less than 1 cm thick is intermixed with sediments from the neighboring sea floor within a few weeks after deposition is completed; subsequent entrance of wastes into the water column is due to biological mixing in the top 10 cm of the waste deposit. The results show that permanent waste deposits may be constructed in coastal localities with favorable natural sedimentary regimes provided close control over the deposition process is attained. (Sinha-OEIS)
W80-04069

DREDGING AND DISPOSAL IN CHESAPEAKE BAY, 1975-2025,
Johns Hopkins Univ., Baltimore, MD. Chesapeake Bay Inst.
M. G. Gross, and W. B. Cronin.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 131-145, 1979. 3 Fig, 7 Tab, 26 Ref, Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Waste disposal, *Dredging, *Water pollution effects, Sediment transport, Environmental effects, Resources development, *Outer Continental Shelf, Chesapeake Bay, Ocean dumping, Dredged material, Biological effects.

In Chesapeake Bay frequent dredging is required in three locations: Bay entrance, harbors, and the turbidity maxima at the fresh-/salt-water interfaces. Between 1975 and 2025, 560 x 1,000,000 cu m are scheduled to be dredged to maintain existing channels and to deepen them to accommodate larger vessels. One third of the dredging is associated with new construction projects; two thirds comes from maintenance dredging. Approximately half the maintenance dredging will be done in port areas where much of the dredged material may be mixed with industrial wastes and sewage discharged. Sources of deposits in channels and port facilities in Chesapeake Bay are poorly understood. Although river sediment discharge to Chesapeake Bay is the main source, smaller but unknown amounts of sediment are contributed by sewage treatment plants, urban runoff, industrial processes, and shoreline erosion. Available data suggest mostly localized and transitory biological effects for those disposal operations involving unpolluted materials that do not alter the physical or chemical character of the bottom. Long-term effects of dredged material disposal in the Bay such as altered current regimes or sediment transport can not be predicted with confidence. Because of shortages of wetland disposal sites, opposition to open-water disposal, and high costs of diked disposal areas, new disposal sites and techniques will likely be needed in the next 50 years to handle the disposal of materials from needed dredging in Chesapeake Bay. Dredging and disposal of dredged materials will continue to be major geological processes in Chesapeake Bay. (Sinha-OEIS)
W80-04070

THE PROBLEM OF MISPLACED SEDIMENT,
Virginia Inst. of Marine Sciences, Gloucester Point.
M. M. Nichols.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 147-161, 1979. 9 Fig, 19 Ref, Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Dredging, *Water pollution effects, *Estuaries, Environmental effects, Sediment transport, Resources development, *Outer Continental Shelf, Ocean dumping, Dredged material, Dredge disposal.

Disposal of estuarine dredged material is a major depositional process with important sedimentologic and hydraulic consequences. Large-scale dredging in U.S. East Coast estuaries has cut channels far below natural equilibrium depths and induced rapid sediment accumulation. In turn, the increased frequency of dredging has created a massive disposal problem and a need for ocean dumping. An estuary channel attains maximum stability by adjusting its bed geometry and hydraulic regime. When a channel is deepened, tidal currents are reduced and sediment deposition accelerates. Deepening causes more salty water to penetrate landward and shifts the zone of maximum shoaling upstream. Landward density currents accelerate the potential for return of dredged material from seaward reaches, while higher stratification enhances the potential for entrapment. Therefore, dredging is partly self-perpetuating. Long-continued open water disposal along channel shoulders of the Upper James Estuary, Virginia, has built up mounds close to the surface where they are subject to wave erosion and current scour. Mounds of misplaced sediment with slopes greater than 6 degrees allow return of sediment to the channel and they restrict tidal flow. By reducing the cross sectional area, they surpress the tide range and tidal discharge in landward reaches. Consequently, dispersion of pollutants is reduced and accumulation of fine-grained sediment is promoted. As a consequence of dredging and disposal, many estuaries are loosing their capacity to absorb more misplaced sediment. (Sinha-OEIS)

NO WASTE DISPOSAL SITES ON THE CONTINENTAL SHELF OFF THE MIDDLE ATLANTIC STATES: OBSERVATIONS MADE FROM SUBMERSIBLES,
Geological Survey, Woods Hole, MA.
D. W. Folger, H. D. Palmer, and R. A. Slater.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 163-184, 1979. 8 Fig, 5 Tab, 26 Ref. Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Waste disposal, *Water pollution effects, *Sediments, Sewage sludge, Benthos, Environmental effects, Resources development, *Outer Continental Shelf, Mid-Atlantic Bight, Ocean dumping, Acid wastes.

Nineteen dives were conducted in August 1974 and July 1975 to survey the Philadelphia sewage and DuPont acid dumpsites about 65 km southeast of the mouth of the Delaware Bay. Though 1974 dives in the sewage dumpsite were carried out the day after 2 million gallons of sewage was released, little evidence of sewage remained in the water column or on the bottom within the area of the dumpsite. Oscillatory wave motion, tidal currents, and benthic organisms apparently were the main mechanisms redistributing sediment on the bottom during the period of the dives. In 1974, at the center of the acid waste site, where a 1-million-gallon release of acid had just taken place, visibility in the water column 6-9 m deep was reduced to zero. Below this opaque layer, suspended matter was composed mainly of large reddish-yellow flocks 1-3 cm long. The visibility reduction and the flocks were apparently due to precipitates from the acid waste that were concentrated at the top of the thermocline. During dives conducted in 1974, bottom samples were collected by both the mother ship and the submersible. At five sites, in both dumpsites, gravel (including shell fragments) averaged 6.1%; sand 88%; and silt plus clay, 2.1% of the sediment. Both coarsest and finest materials were accumulating in ripple troughs. Fe, Ti, and Cr in sediments were all higher at the acid site than in surrounding areas. Thus, sewage sludge apparently was being oxidized, eaten, or transported away from the dumpsite and accumulating elsewhere, whereas some acid waste was accumulating on the bottom in the disposal area. MATHEMATICAL MODELING PREDICTIONS OF THE GEOLOGICAL EFFECTS OF SEWAGE SLUDGE DUMPING ON THE CONTINENTAL SHELF,
Raytheon Co., Portsmouth, RI. Environmental Research Lab.
D. O. Cook.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 185-203, 1979. 11 Fig, 16 Ref. Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Sewage sludge, *Water pollution effects, *Mathematical models, Benthos, Environmental effects, Resources development, Waste disposal, *Outer Continental Shelf, Ocean dumping, Geological effects, Mid-Atlantic Bight.

A far-field (beyond the initial mixing zone) water quality math model has been adapted to predict geological implications of ocean dumping. The example simulated is ongoing discharge of digested sewage sludge by the City of Philadelphia at a disposal site located at mid-shelf in the Middle Atlantic Bight. After calibration of the model using hydrographic field data, predictions were made of the horizontal distributions of suspended solids and deposition following an individual dumping incident. The distributions shift south-southwest of the discharge line in response to non-tidal currents and disperse over a larger area with time. The predictions are highly dependent upon assumed settling characteristics of the sludge. The hydrodynamic simulation of the study area appears to be reasonably accurate. The geological predictions, in particular those for deposition, represent a first order estimate because of uncertainties in sludge solid settling behavior and pre/post depositional sludge fate. Regarding this fate, the effects of sludge recycling by zooplankton in the water column and detritus feeders on the sea floor are unknown. Also, the presence of physical structures in bottom photographs suggests that settled sludge solids would be subject to periodic resuspension. Until these uncertainties are resolved and quantified, the primary use of predicted depositional patterns is to indicate those areas of the sea floor where the benthic community may potentially be affected by sludge disposal. DISTRIBUTION OF SUSPENDED PARTICULATE MATTER NEAR SEWAGE OUTFALLS IN SANTA MONICA BAY, CALIFORNIA,
University of Southern California, Los Angeles. Dept. of Geological Sciences.
R. L. Kolpack.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 205-239, 1979. 25 Fig, 37 Ref. Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Waste disposal, *Sewage sludge, *Sediment transport, Suspended solids, Sediment-water interfaces, Outfall sewers, Water pollution effects, Environmental effects, California, Resources development, *Outer Continental Shelf, Ocean dumping, Santa Monica Bay.

Distribution and transport paths of sewage particles within the water column on the Santa Monica

Shelf were studied with more than 500 light-transmission profiles made on 8 cruises between September 1970 and November 1972. Additional measurements of temperature, salinity and bottom currents were used to interpret the distribution of suspended matter in the water column. No significant accumulation of particulate material around the discharge sites has been detected. The sewage plume in Santa Monica Bay rises rapidly from an initial discharge depth of about 60 meters to about 20 meters below the water surface. On occasion the sewage effluent can be detected at the water surface. Wave action in the water column tends to disperse the sewage plume over a large part of the Santa Monica Shelf. The dominant direction of initial transport during most of the year is toward the shoreline southeast of the discharge site. Subsequently, at several reasonably consistent locations within the bay the net transport of the sewage material, as well as material derived from nearshore mixing, is directed toward the west and transported offshore in well-defined zones which are approximately normal to the coastline. The amount of suspended material transported to the offshore area via Santa Monica and Redondo canyons appears to be rather negligible during normal conditions. On the other hand, a significant portion of the suspended material in Santa Monica Bay is transported within the near-surface water column toward the offshore basins. This pattern of particle transport also takes place at the water surface and at the sediment-water interface, although there is somewhat more variation near these surfaces. (Sinha-OEIS)

DREDGED MATERIAL, OCEAN DISPOSAL, AND THE REGULATORY MAZE,
Smith (David D.) and Associates, San Diego, CA.
D. D. Smith.
In: 'Ocean Dumping and Marine Pollution--Geological Aspects of Waste Disposal,' p 241-262, 1979. 2 Fig, 1 Tab, 29 Ref. Palmer, H.D. and Gross, M.G. (Eds), Dowden, Hutchinson and Ross, Inc, Stroudsburg, Pa.

Descriptors: *Waste disposal, *Dredging, *Regulations, Water pollution, Environmental effects, Resources development, *Outer Continental Shelf, *Ocean dumping, Dredged material, Environmental impact statements.

Dredged material disposed of at sea each year totals about 50 to 75 x 1,000,000 cu m, which is roughly 15 to 20% of the total sediment dredged in the U.S. annually. These volumes are discharged at some 125 designated ocean disposal sites, of which about 60% are located within the three mile limit. Disposal of dredged material requires a permit issued by the Corps of Engineers in accordance with Environmental Protection Agency regulations and criteria. Obtaining this permit requires maneuvering through a complex procedural network (i.e. the regulatory maze) comprised in part by the numerous and varied criteria that govern the review and processing of the permit application. The regulations governing ocean disposal also presecribe additional sets of criteria for evaluating (1) the dredged material to be disposed of, (2) the site proposed for disposal use, and (3) the environmental effects of the proposed disposal activity. Thus, literally dozens of criteria must be considered by the Corps in reaching a decision as to whether or not a permit for ocean disposal should be issued. Unfortunately, the governing regulations contain no recommended framework or standard methodology within which these many croteria can be applied--a major omission that requires resolution. Until such a framework or methodology is established, the decisions reached using the criteria must be recognized as highly subjective and potentially vulnerable to litigation. (Sinha-OEIS)

INVESTIGATIONS OF PHYSICAL PROCESS,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
J. A. Galt.
In: 'The AMOCO CADIZ Oil Spill. A Preliminary Scientific Report,' p 7-20, April 1978. 3 Fig, 11 Ref, 11 Photos, NOAA/EPA Special Report.

Descriptors: *Oil spills, *Oil pollution, *Water pollution effects, *Tidal effects, *Winds, Coasts, Environmental effects, Beaches, Intertidal areas, Currents(Water), Shores, *Outer Continental Shelf, Amoco Cadiz, Nearshore processes, Environmental impact, France.

The Amoco Cadiz disaster presented a unique opportunity to study oil spills in the marine environment. The massive amounts of oil discharged, and its position close to a lee shore made this a particularly interesting spill to study. The spilled oil appeared in a variety of forms. These could be described in terms of four classes: mousse, sheen, light foam, and weathered mousse as small globs. Estimates were made of what was thought to be the dominant oceanographic or metorological processes affecting the movement and spreading of the oil. Winds were strong during much of the spill event and contributed to the oil movement both directly and indirectly. Direct wind forcing was through wind/wave/oil interactions, and indirect forcing was hypothesized to take place through a sea surface set-up along the coast and subsequent development of an alongshore current system. Both components of the wind forcing tended to move the oil eastward in a coastal band during the March periods of study. Tidal forcing was investigated and estimated to play an important role through convergences and divergences in the offshore area and through the beaching/tidal pumping sequence that took place along the coast. The orientation of the coastline and alongshore current system were seen to affect the oil distribution. The stranding of heavy oil concentrations appeared to occur only during ebbing tides and seemed condition on the intertidal beach face coming in direct contact with the oil. (Sinha-OEIS)

CHEMICAL COMPOSITION OF SELECTED ENVIRONMENTAL AND PETROLEUM SAMPLES FROM THE AMOCO CADIZ OIL SPILL,
National Oceanic and Atmospheric, Boulder, CO. Outer Continental Shelf Environmental Assessment Program.
J. A. Calder, J. Lake, and J. Laseter.
In: 'The AMOCO CADIZ Oil Spill. A Preliminary Scientific Report,' p 21-83, April 1978. 35 Fig, 10 Tab, 4 Photos, NOAA/EPA Special Report.

Descriptors: *Oil spills, *Water pollution, *Chemical analysis, Sampling, Environmental effects, Weathering, Biota, Resources development, *Outer Continental Shelf, France, Brittany.

The analyses described in this report represent initial chemical investigations by the University of New Orleans' Center for Bio-Organic Studies (UNO-CBS), the U.S. Environmental Protection Agency, Environmental Research Laboratory, Narragansett (EPA-ERLN), and the National Oceanic and Atmospheric Administration's National Analytical Facility NOAA-NAF), on the composition and fate of oil spilled along the Brittany coastline by the Amoco Cadiz. While many of the analyses are qualitative in nature, much quantitative information is presented. The information reported is useful in studying the nature and composition of the initial petroleum entering the environment and the transformation of this material as part of the weathering process. Selected samples were collected at different locations along the Brittany coastline. Samples included weathered oil samples floating on the water surface, samples of the mousse (water-in-oil emulsion) and oily froth, soils, sediments, water column samples, and biota samples such as sea grass, polychaetes, and periwinkles from the tidal zone. Medium Arabian crude oil was analyzed as a standard. (Sinha-OEIS)

INVESTIGATIONS OF BEACH PROCESSES,
South Carolina Univ. Columbia. Dept. of Geology.
E. R. Gundlach, and M. O. Hayes.
In: 'The AMOCO CADIZ Oil Spill. A Preliminary Scientific Report,' p 84-196, April 1978. 65 Fig, 24 Tab, 13 Ref, 21 Photos, NOAA/EPA Special Report.

Descriptors: *Oil spills, *Water pollution effects, *Geomorphology, *Sediments, Environmental effects, Coasts, Beaches, Cleaning, *Outer Continental Shelf, Beach processes, Interstitial water.

According to the best estimate, 64,000 tons of the Amoco Cadiz oil came ashore along 72 km of the shoreline of Brittany during the first few weeks of the spill. At the end of April, the total volume of oil onshore was reduced to 10,000 tons, but, by that time, 320 km of shoreline had been contaminated. Coastal processes and geomorphology played a major role in the dispersal and accumulation of the oil once it came onshore. Although the surfaces of the beaches and tidal flats at many places were free of oil, the interstitial ground water was contaminated. This may have been the cause of the extensive biological kills at certain areas. Unfortunately, the use of large pits and trenches as collection sites for the oil may increase the amount of ground water contamination. The use of bulldozers to plow heavily oiled gravel into the surf zone for cleansing by wave action is a sound practice, from a geological point of view because no sediment is removed from the beach. Removal of sediment from certain areas increased the rate of beach erosion. The unrestricted use of heavy machinery on the beach and low-tide terrace generally turned oil deeper into the sediments. Where possible, traffic should be limited to specified access routes. (Sinha-OEIS)

BIOLOGICAL OBSERVATIONS,
National Marine Fisheries Service, Beaufort, NC. Southeast Fisheries Center.
F. A. Cross, W. P. Davis, D. E. Hoss, and D. A. Wolfe.
In: 'The AMOCO CADIZ Oil Spill. A Preliminary Scientific Report,' p 197-228, April 1978. 3 Fig, 2 Tab, 25 Ref, 24 Photos, NOAA/EPA Special Report.

Descriptors: *Oil spills, *Water pollution effects, *Environmental effects, *Oil pollution, Intertidal areas, Biota, Algae, Aquatic life, Resources development, *Outer Continental Shelf, *Biological effects, Brittany, Sea grasses, Patella vulgata, Patella, Aspera, Crastoderma-Cardium edule, Arenicola marina, Venerupis aurea, Littorina.

The portion of the Brittany coast impacted by the oil spill consists of diverse ecological habitats and biological communities, including exposed sandy beaches, rocky headlands, protectec bays, estuaries, and marshes. Biological communities in all these habitats were subjected to stress by the oil. Impact of the oil on intertidal communities in general was quite severe. Macroalgae on exposed rocks tended to retain the oil long after it had been removed from bare rocks by wave action. In addition to potential adverse effects of the oil on the macroalgae, retention of oil by this material undoubtedly increased contact time between the oil and organisms living beneath the algae. More chronic effects may be occurring, however, as several preliminary bioassays on these plants indicate that the fertilization process filed to occur in exposed algae. Adverse effects from exposure to oil were noted on limpets (Patella vulgata and P. aspera) over most of the impacted coastline. Nearly complete mortality of limpets and periwinkles occurred in the rocky intertidal zone immediately inshore of the wreck. Live cockles (Cerastoderma-Cardium edule), in particular, were ob-

served on the surface in sandy environments all along the affected coast. The valves of many of these animals could be pulled apart easily, which indicated their weakened condition prior to death. The mortality of intertidal organisms, in general, did not occur as soon as mousse entered their environment but was observed over a period of two months following the wreck. (Sinha-OEIS)

OIL SPILL CLEANUP ACTIVITIES,
Texas A and M Univ., College Station.
R. W. Hann, Jr., L. Rice, M-C. Trujillo, and H. N. Young, Jr.
In: 'The AMOCO CADIZ Oil Spill. A Preliminary Scientific Report,' p 229-275, April 1978. 26 Fig, 3 Tab, 16 Photos. NOAA/EPA Special Report.

Descriptors: *Oil spills, *Water pollution effects, *Cleaning, Intertidal areas, Environmental effects, Aquatic life, Equipment, Operations, *Outer Continental Shelf, Brittany, AMOCO CADIZ.

The oil spill from the supertanker AMOCO Cadiz off the Brittany Coast of France overshadows by far any other oil spill into the marine environment. In terms of oil reaching the shore, it was on the order of four times the amount of the Torrey Canyon spill in the same general geographic area or the Metula spill in the Straits of Magellan. As a result, the spill and the subsequent activities to clean up the oil and mitigate damage provided a fascinating laboratory for those interested in institutional structure, planning, resource requirements, technology and training to deal with disasters of this magnitude. The physical properties, behavior, and movement of the oil and its ultimate deposition on the beaches is discussed in detail. The organizational structure established to deal with the spill and the strategy of control that appears to have been followed are presented and evaluated with regard to their utility in other spills. In addition the processes and unit operations used on the beaches are discussed. Estimates of the manpower and equipment used at different times throughout the spill are based on extensive reviews of newspaper reports and daily pollution reports issued by the Department of Equipment. The final section discusses what has been learned from this experience. (Sinha-OEIS)

IMPACT OF AN INTRODUCED FISH SPECIES (MORONE AMERICANA) ON THE FISHERIES RESOURCES OF NEBRASKA,
Nebraska Univ., Lincoln. Dept. of Forestry, Fisheries and Wildlife.
E. J. Peters, and R. Ballinger.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158512, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Center, University of Nebraska Technical Completion Report, March 1980, 13 p, 3 Fig, 2 Tab, 6 Ref. OWRT A-051-NEB (1), 14-34-0001-9029.

Descriptors: *White perch, *Fish establishment, *Saline lakes, *Nebraska, *Environmental effects, Fish populations, Fish physiology, Fish stocking, Number fish per acre, *Morone americana.

During the mid-1960's white perch (Morone americana) were evaluated as a possible species to be stocked in several saline lakes of the Sandhills of Nebraska. This possibility was abandoned after it was found that populations did not reach sizes suitable for fishing. White perch were removed and reservoirs restocked with more desirable species; however, a remnant population was discovered in Salt Creek. The objectives of this study were to: (1) document the extent of the white perch population in the Salt Creek drainage; and (2) study the dynamics of the Buckley 3F Reservoir population and determine its rate of spread downstream. Sections of creek downstream from Buckley 3F reservoir were seined and electrofished during 1978 and 1979. The population of white perch in Buckley Creek 3F Reservoir was sampled irregularly throughout 1978 and 1979 in order to determine population density, growth rate, spanwing time, mortality rate and food habits. To date no evidence of white perch has been found in the Little Blue River drainage outside of Buckley Creek 3F Reservoir. This includes sampling Buckley Creek immediately downstream from the reservoir. The final best estimate of white perch in Buckley Creek 3F Reservoir is 2,638, which is equivalent to 204 fish/hectare. White perch appear to be the most abundant fish species in the reservoir, comprising over 90% of the total number of fish captured.

ZOOPLANKTON IN AN UPWELLING AREA OFF NORTHWEST AFRICA: COMPOSITION, DISTRIBUTION AND ECOLOGY,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
M. Blackburn.
Deep Sea Research, Vol 26A, No 1, Part AA, p 41-56, January 1979. 3 Fig, 8 Tab, 28 Ref. NSF GX-33502 and OCE76-81172.

Descriptors: *Zooplankton, *Upwelling, *Africa, *Continental slope, *Continental shelf, Copepods, Distribution, Biomass, Ecology, Size, Predation, Advection, Distribution patterns, Spatial distribution, Secondary productivity, Dominant organisms, Systematics, Temporal distribution.

Mean zooplankton biomass increases from the inner continental shelf to the slope off northwest Africa, March-May 1974 in an upwelling area. The continental shelf is bounded by the 100-m isobath, beyond which there is a steep slope. Shelf biomass includes predominately small zooplankters between 0.1-0.5 mm, and slope biomass is predominately large animals > 1.0 mm. Organisms 0.5-1.0 mm make a small contribution to both. The inner shelf is a consistently poor area for zooplankton by comparison with the outer shelf and slope. Principal taxa by weight are Copepoda, Euphausiacea, Thaliacea and Coelenterata. Copepoda greatly predominate. Euphausiacea and Thaliacea are important only in the > 1.0mm group. Temporal changes in zooplankton biomass are moderate and mainly affect Copepoda and Thaliacea. Copepoda show more temporal change on the slope where they are mostly large than on the outer shelf where they are mostly small. Thaliacea change with time in the same way in both areas, which are occupied by the same population of large individuals. Estimated gains and losses to zooplankton from local biological conditions are much smaller than those from advection. In a 390 million sq m area across the outer shelf, where flow is almost always southward at all depths, daily change in biomass is estimated as follows: 10-50 billion g entering and leaving by advection, and 0.1-3.0 billion g entering and leaving as a result of local production and local fish predation. (Danovich-Wisconsin)

ADDITION OF NUTRIENTS TO A LAKE LEADS TO GREATLY INCREASED CATCH OF SALMON,
Fisheries and Marine Service, Nanaimo (British Columbia). Pacific Biological Station.
R. J. LeBrasseur, C. D. McAllister, and T. R. Parsons.
Environmental Conservation, Vol 6, No 3, p 187-190, Autumn 1979. 1 Fig, 1 Tab, 5 Ref.

Descriptors: *Fish harvest, *Salmon, *Nutrients, *Productivity, *Lakes, *Great Central Lake(British Columbia), *Fish farming, *Fertilization, Fish management, Fisheries, Sockeye salmon, Vancouver Island(British Columbia), Canada, Fertilizers, Phytoplankton, Fish populations, Fish establishment, Nutrient requirements, Spawning, Fish migration, Juvenile fish, Fish.

During 1969-1970 about 100 tons of fertilizer were applied to Great Central Lake, Vancouver Island in hope that dissolved nutrients would increase production of sockeye salmon (Oncorhynchus nerka). Experiment results were favorable; both animal and plant production in this oligotrophic lake increased. Average weight of young salmon increased by 30%. The number of juveniles surviving from spring emergence to November increased nearly threefold. The number of fish migrating back to Great Central Lake increased seven times over 1969 fish numbers. Experiment costs were $5 million. Gross value of the salmon catch over four years (1973-1976) was $14.1 million. Thus the apparent benefit from fertilizer application to the lake was $9 million. In addition the experiment was responsible for an increased number of spawners, whose progeny would support fishing four to five years later. The added fertilizer is known commercially as 27-14-0 (27% N, 14% P205, 0% K20) and has a nitrogen-to-phosphorus ratio of 10:1. An organic supplement in the form of fish solubles was also added in small amounts in 1969 in order to provide chelation for trace elements contained in the organic fertilizer. Timing of the nutrient additions was adjusted to coincide with warming of surface waters. (Harris-Wisconsin)

SEASONAL CHANGES IN STRUCTURE OF A SUBMERGED BLUEGREEN ALGAL/BACTERIAL COMMUNITY FROM A GEOTHERMAL HOSTSPRING,
Texas Univ. at Arlington. Dept. of Biology.
W. R. Fagerberg, and H. J. Arnott.
Journal of Phycology, Vol 15, No 4, p 445-452, December 1979. 8 Fig, 2 Tab, 23 Ref.

Descriptors: *Cyanophyta, *Aquatic bacteria, *Thermal springs, *Mimbres(NM), *Seasonal, *Temporal distribution, Water temperature, Analytical techniques, Thermal water, Geothermal studies, Light quality, Aquatic plants, Freshwater algae, Biomass, Spatial distribution, Speciation, Bacteria, Algae, Light, Light intensity, Volume, New Mexico.

Seasonal changes in a submerged blue-green algal/bacterial community at geothermal hotsprings in Mimbres, New Mexico correlate with seasonal changes in light intensity and duration. The community receives three h sunlight/d. Light is severely restricted in fall when tree leaves accumulate on the water surface. Total mat volume occupied by living organisms never exceeds 2%; volume remains relatively constant from January to July then drops sharply in November. Most of the living mat volume is occupied by bacteria (99%). Density values show a slight but steady decrease from a January high of 16 individuals/1000 micro sq m to a November low of 10 individuals/1000 micro sq m. Maximal distribution values for both blue-green algae and bacteria occur during spring and summer months. Three dominant blue-green algal cytospecies which represent the greatest amount of biomass, alternate in their abundance on a seasonal basis while the three dominant bacterial cytospecies remain the same. Blue-green algal/bacterial mat communities occur within a gelatinous matrix that also contains gas and water bubble chambers. Water temperature in which the mats are submerged shows little change over the year. Stereological techniques were used to measure biomass, density, distribution and species diversity. THE UPTAKE OF UREA BY CHLORELLA,
University Coll. of Swansea (Wales). Dept. of Botany and Microbiology.
I. A. Bekheet, and P. J. Syrett.
The New Phytologist, Vol 82, No 1, p 179-186, January 1979. 4 Fig, 5 Tab, 6 Ref.

Descriptors: *Chlorella, *Kinetics, *Ureas, *Marking techniques, Algae, Chlorophyta, Nutrients, Cytological studies, Metabolism, Tracers, Radioactivity techniques, Photosynthesis, Light, Darkness, Nutrient requirements, Cycling nutrients, Chromatography, Radioisotopes, Analytical techniques.

Experiments show that light stimulates uptake rates of radioactive urea by Chlorella. C-14 contained in radioactivated urea is taken up rapidly by urea-grown Chlorella cells. Uptake rates are considerably greater than those attained by passive diffusion and are much more rapid in light than in darkness. Uptake rates relate to urea concentration hyperbolically and K-m is 16.5 micro M. However, examination casts doubt on what is being measured when C-14 is taken up from (C-14) urea. After five minutes, only 45% of C-14 taken up is recovered in urea; moreover, although C-14 uptake rates are much lower in darkness than in light, rates at which C-14 disappear from the medium are not very much different. DCMU, an inhibitor of photosynthetic carbon dioxide fixation, inhibits markedly C-14 uptake in light. These findings strongly suggest that Chlorella metabolizes C-14 urea rapidly in either light or in darkness with carbon dioxide production which, in light, is converted to organic compounds by photosynthesis. Nevertheless, light stimulates urea uptake as shown when (C-14) urea in cells is extracted and separated by thin-layer chromatography. Since C-14 uptake is inhibited competitively by thiourea and (C-14) urea metabolism occurs so rapidly, it may be preferable to study Chlorella uptake mechanisms by using thiourea. (Danovich-Wisconsin)

THE POTENTIAL EFFECTS OF ENERGY RELATED ACTIVITIES ON THE SEASONAL TRAJECTORIES OF EPIPHYTIC MARINE DIATOMS,
City Univ. of New York. Dept. of Biology.
G. F. Coccetti, and J. J. Lee.
Hydrobiologia, Vol 67, No 1, p 51-80, November 1979. 9 Fig, 8 Tab, 44 Ref. ERDA E(11-1)3254, (C00)3254-28.

Descriptors: *Biological communities, *Diatoms, *Succession, *Niches, Cultures, Speciation, Ecology, Growth rates, Heavy metals, Oil, Algae, Plant groupings, Statistics, Seasonal, Epiphytes, Water quality, Sippewisset Marsh(MA), Jamaica Bay(NY), Southampton(NY), New York, Massachusetts.

Seasonal successional trajectories measured summer 1973 show that each species of transplanted and experimental diatom communities has a definable niche and if all experimental factors are equal, niches are expressions of competition pressures, synergisms and antagonisms exerted by coexisting community members. Very few generalizations could be made about individual species' behavior in any particular experiment. Diatom assemblages were manipulated at Sippewisset Marsh, Massachusetts, by an in-situ experimental apparatus capable of incubating these organisms without doing violence to the community itself. Epiphytic diatom community assemblages were taken from Jamaica Bay and Southampton, New York and from Sippewisset Marsh. A mixture of the inocula was also made and the effects of Fe, Cu, Cr, Pb, Zn and crude oil was tested. Since random environmental fluctuations were constant for all assemblages, individual species abundance was due to niche packing and interspecific restraints as well as changes in water quality. Twice as many species (40%) had their greatest niche breadth in the mixed community as did species in transplanted (20%) or native controls (17%). Medium enrichment with heavy metals and oil altered community structure and diversity. Cu and Cr assemblages initially followed oil and Pb trajectories but diverged later. Greatest species diversity occurred with Cu incubations. Fe enriched communities generally diverged from all the others. (Danovich-Wisconsin)

NUMERICAL ABUNDANCE AND BIOMASS OF BACTERIA, ALGAE AND MACROBENTHOS OF A LARGE NORTHERN RIVER, THE ATHABASCA,
Waterloo Univ. (Ontario). Dept. of Biology.
D. R. Barton, and M. A. Lock.
Internationale Revue der Gesamten Hydrobiolgie, Vol 64, No 3, p 345-359, 1979. 6 Fig, 1 Tab, 42 Ref.

Descriptors: *Athabasca River(Alberta, Canada), *Bacteria, *Algae, *Benthos, *Sampling, Canada, Speciation, Biomass, Chlorophyll-a, Standing crop, Invertebrates, Diptera, River beds, Rivers, Seasonal, Sediments, Substrates, Sands, Mud, Particle size, Distribution, Spatial distribution.

Autumnal direct sampling of Athabasca River (northern Alberta, Canada) macrobenthos shows that bedrock fauna is similar in composition and numerical density to that reported from smaller streams, while a group of specialized chironomid larvae dominates the fauna of sand and mud. Invertebrate biomass is similar on coarse sand and mud and lower on fine sand. Numerical standing stocks show a decreasing order from coarse sand to mud to muddy sand to medium sand to fine sand. Larvae of an undescribed species of Parakiefferiella dominates coarse sand fauna. On bedrock, invertebrate biomass and sessile bacteria abundance are greatest close to the water's edge and at 3 m depth. Bacterial densities are within ranges for rocks in similar streams. Chlorophyll-a standing crop at 1.5 m is about one-half that found at 0.25 m. ATP levels are closely associated with numbers of small invertebrates (less than 6 mm) but not with bacteria or algae biomass. Benthic primary production probably contributes organic matter to the river, but is probably limited by rapid light attenuation due to extended periods of high turbidity during the open water season. Most of the energy available to benthic communities is probably allocthonous in origin. The average width of the river near Fort MacKay where sampling was done is about 400 m, main channel depth is at least 4.5 m during the open water season, and discharge ranges from 200 cu m/sec in winter to over 1700 cu m/sec in summer. (Harris-Wisconsin)

VOLATILE ORGANIC SULFIDES FROM FRESHWATER ALGAE,
Washington State Univ., Pullman. Dept. of Botany.
M. J. Bechard, and W. R. Rayburn.
Journal of Phycology, Vol 15, No 4, p 379-383, December 1979. 2 Fig, 2 Tab, 19 Ref.

Descriptors: *Cyanophyta, *Freshwater, *Sulfur compounds, *Ecology, *Dimethyl sulfide, *Valley Road Pond(WA), Sulfur, Sulfides, Chlorophyta, Diatoms, Chrysophyta, Xanthophyta, Microenvironment, Gas chromatography, Sulfur bacteria, Speciation, Microbiology, Gases, Cultures, Eutrophication, Laboratory tests, Aquatic algae.

This study suggests that dimethyl sulfide (DMS) is the principle atmospheric sulfur carrier in freshwater ecosystems which support large communities of filamentous green and blue-green algae. DSM concentrations measured April-September 1973, ranged from trace amounts in spring and fall to 70,000 Ng/l in summer in Valley Road Pond, near Pullman, Washington. Highest DMS concentrations occur when Nostoc are abundant and Spirogyra and Oedogonium mats are decaying. Gas chromatography analysis of nonaxenic cultures of Nostoc alone show it produces only small DMS amounts. Analyses of Oedogonium and Spirogyra, young and old cultures indicate that hydrogen sulfide (H2S), DMS and dimethyl disulfide (DMDS) occur only in senescent cultures. Bacterial contamination reduction in these cultures with penicillin G results in no detectable sulfur production. Algal axenic cultures not endemic to the pond were also analyzed. Six Cyanophyta species produce DMS and DMDS. Two produce methyl mercaptan. Chlorophyta, Xanthophyta and Bacillariophyta do not produce detectable sulfur compounds. Therefore, sources of DMS depend on algal community composition. In freshwater ecosystems which support large Chlorophyta, Xanthophyta and Bacillariophyta populations, DMS is probably not algal in origin. Rather, it is bacterial in origin with decaying algae acting as a substrate for bacterial growth. In freshwater ecosystems with Cyanophyta dominating, DMS is not only bacterial in origin but it is also synthesized directly by blue-green algae. (Danovich-Wisconsin)

SOME PHOTOSYNTHETIC CARBON FIXATION PROPERTIES OF SEAGRASSES,
Tel Aviv Univ. (Israel). Dept. of Botany.
S. Beer, and Y. Waisel.
Aquatic Botany, Vol 7, No 2, p 129-138, October 1979. 5 Fig, 1 Tab, 12 Ref.

Descriptors: *Marine algae, *Photosynthesis, *Carbon dioxide, *Plant physiology, *Carbonates, Carbon, Red Sea, Mediterranean Sea, Tracers, Chloropyyll, Speciation, Cymodocea nodosa, Halophila ovalis, Enzymes, Laboratory tests, Ecology, Adaptation, Biochemistry, Sea water, Israel.

The main exogenous carbon form utilized by seagrass species is HC03-; this agrees well with high HC03- concentrations found in seawater compared with C02 concentrations. The former concentration at 2.5 mM is saturating for photosynthesis in these plants. One Mediterranean seagrass species, Cymodocea nodosa, and three Red Sea species, Halophila ovalis, H. uninervis and Syringodium isoetifolium were used in experiments. C. nodosa and H. ovalis net photosynthetic rates at saturating HC03- concentrations are 0.4 and 0.05 micro moles 02/min mg chl, respectively. When additional C02 is added, photosynthetic rates increase. In C. nodosa, photosynthetic rates are three times higher at saturating C02 concentrations than at saturating HC03- concentrations. In H. ovalis, photosynthetic rates are similar at saturating concentrations of both carbon forms. Whether HC03- is fixed directly by phosphoenolpyruvate carboxylase or transformed to C02 and fixed by ribulosebiphosphate carboxylase probably depends on the levels of these and other enzymes as well as which carbon form is available. C14 pulse-chase experiments show that H. uninervis and S. isoetifolium are C3 plants, even though they posses features indicating C4 metabolism. These plants are unlike Thalassia testudinum, shown earlier to be a C4 plant. Variations in photosynthetic pathways reflect an ability of seagrasses to adapt to various ecological conditions. (Danovich-Wisconsin)

EPIPELIC AND EPILITHIC DIATOM ASSEMBLAGES IN MONTEZUMA WELL NATIONAL MONUMENT, ARIZONA,
Minnesota Univ., St. Paul. Dept. of Botany.
D. B. Czarnecki.
Journal of Phycology, Vol 15, No 4, p 346-352, December 1979. 3 Fig, 2 Tab, 26 Ref.

Descriptors: *Diatoms, *Montezuma Well National Monument(AZ), *Biological communities, *Benthic flora, *Correlation analysis, Speciation, Systematics, Seasonal, Light intensity, Biomass, Water chemistry, Epilithic, Epipelic, Sediments, Achnanthes, Cocconeis, Cyclotella, Fragilaria, Rhiocosphenia, Synedra, Statistics.

Epipelic assemblages at Montezuma Well National Monument, Arizona, measured May 1976-April 1977, show a tri-dominant association of Cyclotella pseudostelligera, Cocconeis placentula and Achnanthes linearis. Epilithic assemblages are also tridominant: Rhoicosphenia curvata, C. pseudostelligera and Synedra ulna. Of the 83 diatom taxa observed, 51 are common to both assemblages, 24 are restricted to the epipelon and eight to the epilothon. C. pseudostelligera clearly dominates the epipelon throughout most of the year, ranging 74.6%-12% in relative abundance. The epilithon is clearly dominated by R. curvata, ranging 61%-10% in relative abundance. Based on seasonal abundance patterns, C. pseudostelligera and S. ulna outcompete other taxa during high light intensity and duration periods, while Fragilaris construens responds more favorably under low light intensity and duration. A. linearis, R. curavata and C. placentula are more tolerant of a wide range of light intensities and durations. On a yearly basis, both assemblages exhibit slight similarity. Mean diversity values and similarity indices are unacceptable when comparing assemblages with few highly abundant taxa. The use of dissimilarity indices are recommended. Montezuma Well National Monument, located 80 km south of Flagstaff, is a circular limestone depression 0.76 ha and 6.7 m deep. The system exhibits nearly constant nutrient levels and an unusually high free C02 content (690 mg/l). (Danovich-Wisconsin)

SPATIAL AND TEMPORAL PATTERNS OF TEMPERATURE, ALKALINITY, DISSOLVED OXYGEN AND CONDUCTIVITY IN AN OLIGO-MESOTROPHIC, DEEP-STORAGE RESERVOIR IN CENTRAL TEXAS,
Southwest Texas State Univ., San Marcos. Aquatic Station.
H. H. Hannan, I. R. Fuchs, and D. C. Whitenberg.
Hydrobiologia, Vol 66, No 3, p 209-221, October 1979. 12 Fig, 23 Ref.

Descriptors: *Canyon Lake(TX), *Stratification, *Dissolved oxygen, *Conductivity, *Alkalinity, *Spatial distribution, *Trophic levels, Reservoirs, Epilimnion, Seasonal, Anaerobic conditions, Temporal distribution, Water temperature, Turbidity, Impounded waters, Physicochemical properties, Physical properties, Chemical properties, Hypolimnion, Carbonates, Environmental effects.

Physicochemical analyses of impounded waters in Canyon Lake, Texas, February 1976-January 1977 show that transparency increases and surface bicarbonate alkalinity and conductivity decrease with distance down reservoir. Greater turbidity at riverine stations is caused by greater plankton quantities and heavier silt loads. Transparency fluctuations in the reservoir are due to plankton population fluctuations. Riverine stations exhibit a wider temperature range than reservoir waters. Thermal stratification is sufficiently established by June to develop an anoxic hypolimnion. Epilimnion depth increases and hypolimnion waters continue to warm through September. Increased epilimnion depth is caused by withdrawal of cold water from the hypolimnion. Epilimnion alkalinity decreases during summer as a result of photosynthetic bicarbonate uptake. Hypolimnetic alkalinity increases are due to increases in carbon dioxide from decomposition. Bicarbonate concentrations decrease 16-31% with distance through the reservoir; this is caused by bicarbonate utilization in primary phytoplankton productivity. A downstream pattern of hypolimnetic oxygen depletion was observed. Oxygen concentrations less than 1 mg/l occur in upstream sections in June and near the dam in August; this is due to smaller hypolimnetic volume and greater input of oxidizable sediments in upstream areas. Specific conductance exhibits temporal and spatial variations similar to those of bicarbonate and calcium, the predominant ionic species. (Danovich-Wisconsin)

UPTAKE AND RELEASE OF NUTRIENTS BY AQUATIC MACROPHYTES,
Mankato State Univ., MN. Dept. of Biology.
B. H. Hill.
Aquatic Botany, Vol 7, No 1, p 87-93, September 1979. 2 Fig, 24 Ref.

Descriptors: *Aquatic plants, *Cycling nutrients, *Agricultural runoff, *Macrophytes, *Pondweeds, *Kinetics, Potamogeton nodosus, Potamogeton pectinatus, Potamogeton crispus, Nitrogen, Phosphorus, Carbon, Nutrients, Organic matter, Biodegradation, Degradation(Decomposition), Decomposing organic matter, Biomass, Minnesota, Drainage area, Organic matter, Organic compounds, Nutrient budgets.

Analysis of three aquatic macrophytes species, Potamogeton nodosus, P. pectinatus and P. crispus, from an agricultural drainage ditch in south-central Minnesota during the 1976 growing season shows similar nutrient accumulation and breakdown among species and sites. Nitrogen and phosphorus contents of the aquatic macrophytes are highest at the beginning of the growing season and gradually declined throughout the season. Peak biomass is 336 dwt/sq m for all three species combined. Accumulated nutrients total 5.65 g dwt/sq m for nitrogen and 1.29 g dwt/sq m for phosphorus. Average nutrient values for three species combined are 26.59 mg N/g dwt, 5.89 mg P/g dwt, and 353.7 mg C/g dwt. Species specific breakdown rates and nutrient concentrations are given for P. nodosus only; breakdown rates are 0.0312/d and 0.0408/d at two different sites. Nutrient concentrations remain relatively constant throughout the study. Carbon to nitrogen ratios range from 13.1:1 to 16.2:1. (Harris-Wisconsin)

Simulation results from a mathematical model investigating the effects of both advective and turbulent water movements on the growth of three competing phytoplankton species, show that coexistence of all three species occurs only under turbulent regimes. Plankton diversity is maintained through metabolic responses to a randomly-fluctuating, turbulent environment. Simulataneous coexistence of all three species also occurs only when the primary period of turbulent events is one day, close to turnover rates for phytoplankton populations. In the absence of water motion, no two species are able to coexist, while under hypothetical advection conditions without turbulence (laminar flow) just two species occur contemporaneously. The 'paradox of plankton' states that a diverse array of phytoplankton species invariably coexist. However, the principle of competitive exclusion states that the species with greatest competitive advantage for a given ecological niche utilize environmental resources associated with that niche to such an extent that no other organism simultaneously occupies the same niche. The aquatic medium in which phytoplankton live is continuously being mixed by turbulent eddies. The model investigates possible relationships between phytoplankton diversity and hydrodynamic turbulence in natural waters. Diversity amongst species which compete for the same niche require an environment which fluctuates with a periodicity approaching turnover times for those species; phytoplankton turnover ranges 0.5-5 days. (Danovich-Wisconsin)

BUOYANCY OF NATURAL POPULATIONS OF MARINE PHYTOPLANKTON,
Bergen Univ. (Norway). Inst. of Marine Biology.
C. Lannergren.
Marine Biology, Vol 4, No 1, p 1-10, 1979. 6 Fig, 2 Tab, 18 Ref.

Descriptors: *Buoyancy, *Phytoplankton, *Diatoms, *Floating, *Vertical migration, Population, Fjords, Physical properties, Marine algae, Density, Cytological studies, Nutrients, Aging(Biological), Chlorophyll, Bergen(Norway), On-site data collections, On-site investigations, Growth stages, Population dynamics, Distribution, Norway.

Positive buoyancy was observed only once in a diatom spring bloom, February-April 1977 in a fjord near Bergen, Norway. The investigation was carried out with natural phytoplankton populations under approximate in-situ conditions. Buoyancy was studied in 2.2 m long, transparent Plexiglas tube filled with sea water. The paper concentrates on a diatom spring bloom, but also includes results from a 1976 flagellate-dominated autumn bloom. Positive buoyancy, observed once, is associated with intense growth in the initial bloom phase. Neutral buoyancy occurs on some occasions in the first phase of the bloom, while negative buoyancy occurs in most experiments. Mean sinking rates for the entire chlorophyll content vary 0.3-2.2 m/d. Sinking rates for individual fractions range 0-9 m/d. Results show higher sinking rates in the post-bloom period, indicating that either senescent cells sink faster than actively growing cells or that cells adapt to changing nutrient concentrations. Skeletonema costatum and Chaetoceros dominate the spring bloom. In autumn blooms dominated by coccolithophorids and small, athecate flagellates, positive buoyancy occurs in two out of three cases. As these algae are small and motile, vertical distribution is probably little influenced by sinking. High nutrient concentrations permit growth of large diatoms which, apart from a short period, have comparatively high sinking rates, while low concentrations favor dominance of small flagellates with low or negligible sinking rates. (Danovich-Wisconsin)

IN SITU MEASUREMENTS OF NET PRIMARY PRODUCTION IN A COLORADO MOUNTAIN STREAM,
Colorado Univ., Boulder. Dept. of Environmental, Population, and Organismic Biology.
R. W. Pennak, and J. W. Lavelle.
Hydrobiologia, Vol 66, No 3, p 227-235, October 1979. 3 Fig, 4 Tab, 40 Ref.

Descriptors: *Primary productivity, *Streambeds, *On-site investigations, *Arkansas River(CO), Photosynthesis, Metabolism, Streams, Heterotrophy, Biological communities, Mountains, On-site data collections, Respiration, Seasonal, Water

temperature, Water chemistry, Autotrophy, Benthos, Biomass.

Net primary productivity of the bottom community ranged from -27.38 to 35.59 g C/sq m yr, indicating a range of heterotrophy to autotrophy in the Arkansas River, an unpolluted Colorado white-water stream 1452-2835 m a.s.l., November 1965-1966. Four stations vary between heterotrophy and autotrophy at different times. One station exhibits only heterotrophy; it is unpolluted and located just above the city of Salida in the foothills of the Rocky Mountains. One station exhibits only autotrophy; it is located just upstream from Pueblo in the plains region east of the mountains. Negative primary productivity readings reflect overall dominating heterotrophic conditions; algal respiration and action of bacteria and fungi on organic detritus substrate more than balance algal photosynthesis so there is a net dissolved oxygen loss after 24 hr. There are no seasonal trends and no correlations with water temperature and chemistry. Bottom fauna biomass does not correlate with net community productivity. Five stations have poor biomass with less than 10 g wet wt/sq m, whereas Salida station biomass averages 144 g/sq m. Dissolved oxygen and water temperature are electronically monitored in an undisturbed section of rubble bottom enclosed by a large plastic dome set into the substrate. The entire chamber was completely filled with stream water and set below stream water level. Water in the dome is circulated rapidly by a small submerged electric pump. (Danovich-Wisconsin)

ANALYSIS OF HETEROTROPHIC MICROPLANKTON IN AN UPWELLING AREA,
Akademiya Nauk SSSR, Moscow. Inst. Okeanologii.
Y. I. Sorokin, and J. E. Kogelschatz.
Hydrobiologia, Vol 66, No 3, p 195-208, October 1979. 10 Fig, 6 Tab, 20 Ref.

Descriptors: *Upwelling, *Microorganisms, *Primary productivity, *Heterotrophy, *Punta San Juan, Peru, *Marine algae, Biomass, Bacteria, Phytoplankton, Gymnodinium, Mesodinium, Respiration, Organic matter, Protozoa, Red tide, Dinoflagellates, Density, Nutrients, Growth rates.

In freshly upwelled water in the Punta San Juan region off Peru, April-May 1977, the main component of the planktonic community were microheterotrophs, the development of which precede that of phytoplankton because of independence of the stability of water mass and light conditions. Microheterotroph respiration exceeds by threefold primary photoplankton production. During the movement of upwelled water, biomass increases 1000 times in four days. Near the bloom, biomass in 10 g wet wt/cu m and primary production is 8.6 g C/sq m d, close to maximum for natural oceanic plankton communities. Values of P/B coefficients of phytoplankton reach 7-10/d. Analyses reveal a rich microheterotroph population in the center of upwelling. Bacteria numbers reach 0.3-0.7 million/ml and biomass 10-50 mg C/cu m. Microbial production here is 5-15 mg C/cu m d. Protozoa also flourish in the center of upwelling; wet biomass reaches 1 g/cu m, the highest concentration of protozoa ever recorded in seawater. Dominating species include Strombidium ciliates and various tintinnids. During transects normal to the coast line, abundant dinoflagellate populations (5-40 thousand/l) of Gymnodium and Prorocentrum are found in anoxic waters 50-100 m. In an area over the shelf break and continental slope, a red tide was caused by an intense bloom of ciliate Mesodimium rubrum. This ciliate is a functional autotroph that harbors pseudosymbiotic chloroplasts of cryptomonad origin. Biomass reached 50-70 g wet wt/cu m and cell density 2-4 million/l at the surface. PHOTOSYNTHETIC CARBOXYLATING ENZYMES IN MARINE PHYTOPLANKTON,
Bigelow Lab. for Ocean Sciences, West Boothbay Harbor, ME.
H. E. Glover, and I. Morris.
Limnology and Oceanography, Vol 24, No 3, p 510-519, May, 1979. 7 Fig, 2 Tab, 27 Ref. NSF OCE 77-08722.

Descriptors: *Enzymes, *Biochemistry, *Photosynthesis, *Marine algae, *Phytoplankton, *Primary productivity, Marine microorganisms, Cultures, Laboratory tests, Population, Correlation analysis, Algae, Cytological studies, Analytical techniques, Sea water, Metabolism, Plant physiology, Chemical reactions, Gulf of Maine, Assay, Bioassay.

Data from both cultures and natural marine phytoplankton populations show that carbon fixed by photosynthesis is always greater than that fixed by ribulose-l, 5-besphosphate carboxylase (RUBPCase) and phosphoenolpyruvate carboxylase (PEPCase). Therefore, instantaneous measurement of those carboxylating enzymes does not indicate potential photosynthetic capacity. When RUBP is solubilized it rapidly breaks down and forms products which may inhibit RUBPCase activity. Alternatively, the difference between carboxylase activity and photosynthesis may reflect reactions during assimilation of (C-14) bicarbonate by whole cells and not included in enzymatic assays. The ratio of carbon fixation by whole cells (P-max) to that by carboxylating enzymes such as RUBPCase and PEPCase is not constant. The ratio may indicate the cell's physiological state since it is greatest when photosynthetic rate is highest. The discrepancy between photosynthesis and carboxylase activity is significantly greater in natural populations than in all cultures examined. PEPCase is quantitatively important only when photosynthetic rate is low. The lack of a significant correlation between P-max and RUBPCase:PEPCase ratio in natural populations is probably due to species differences, since Dunaliella has a 29.2 ratio when P-max is high while chrysophyte and diatom cultures have ratios ranging from an eighth to half this value. Water samples were collected from Gulf of Maine and Boothbay Harbor, Maine, December 1977-July 1978; six different algal species were used in the cultures. (Danovich-Wisconsin)

GROWTH, CHLOROPHYLL AND MINERAL NUTRIENT STUDIES ON PHALARIS ARUNDINACEAE L. IN THREE SCOTTISH LOCHS,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
Y. B. Ho.
Hydrobiologia, Vol 63, No 1, p 33-43, March 1979. 11 Fig, 6 Tab, 15 Ref.

Descriptors: *Aquatic plants, *Chemical analysis, *Plant growth, *Chlorophyll, *Scotland, Lakes, Phalaris arundinaceae, Forfar Loch(Scotland), Balgavies Loch(Scotland), Loch of the Lowes(Scotland), Growth rates, Plant tissues, Nutrients, Leaves, Root development, Trophic level, Sewage effluents, Standing crops, Seasonal, Biochemistry, Plant physiology, Plant morphology.

During the 1975 growing season, general growth characteristics, chlorophyll content and mineral level were analyzed in reed canary-grass, Phalaris arundinaceae, growing in three shallow lowland Scottish lochs, Forfar Loch (polytrophic), Balgavies (eutrophic) and Loch of the Lowes (mesotrophic). Average maximum shoot heights (160 cm) are similar in all three lochs. Phalaris standing crops are 1151 g dwt/sq m in Forfar, 405 g dwt/sq m in Balgavies, and 440 g dwt/sq m in Lowes. Maximum chlorophyll contents in all three lochs is 8-9 mg/g dwt leaf. Leaf chlorophyll contents peaks twice; the first occurs late April in all three lochs. The second occurs June-July in Balgavies and Lowes while in Forfar it occurs July-August. Chlorophyll content steadily decreases for the rest of the growing season. Some shoot minerals reach maximum in summer and then remain constant for the rest of the season. This pattern applies to C, P, Na and Fe for plants in all lochs, as well as K, Ca and Mg for Balgavies and Lowes plants, indicating mainerals are retained and not released before tissue degradation. The second mineral distribution pattern involves a large decline after summer peak. Nitrogen in all lochs and K, Ca and Mg in Forfar plants follow this second pattern. Forfar shoots also contain a disproportionately greater amount of N, P, Na and Fe compared with the other two lochs; this is probably due to enrichment from sewage effluents. (Danovich-Wisconsin)
W80-04147

PRIMARY PRODUCTION AND BACTERIOPLANKTON IN FISH PONDS WITH MONO AND POLY-CULTURE,
Kalyani Univ. (India). Dept. of Zoology.
B. B. Jana.
Hydrobiologia, Vol 62, No 1, p 81-87, January 1979. 1 Fig, 5 Tab, 10 Ref.

Descriptors: *Primary productivity, *Bacteria, USSR, *Fish Farm Nivka(USSR), Kiev(USSR), *Fish farming, Summer, Plankton, Fish, Carp, Water temperature, Biochemical oxygen demand, Seasonal, Heterotrophy, Population, Respiration, Photosynthesis, Correlation analysis, Grazing, Fish food organisms, Speciation.

No definite relationship exists between primary productivity and bacterioplankton in three fish ponds with mono-/and polyculture in the Fish Farm Nivka, Kiev, USSR, May-September 1975; this probably results from the low percentage of autotrophic photosynthetic bacteria and abundance of heterotrophic bacteria. Biochemical oxygen demand directly correlates with oxygen respiration losses due to bacterial populations however, biochemical oxygen demand does not correlate with total bacterioplankton population. Net photosynthetic oxygen production over 24 h is very small in ponds with mono-/and polyculture, indicating that phytoplanktonic algae are being heavily grazed by herbivorous fishes. Primary production in terms of oxygen release are not pond specific even though fish culture practices differ. Gross primary production averages are 21.54 Kcal/sq m (monoculture), and 22.00-24.09 Kcal/sq m (polyculture). Maximal oxygen production occurs in July; this is coupled with increasing water temperature. Values then tend to decline and reach a minimum in September. Monoculture ponds contain only common carp, whereas common carp (Cyprinus carpio), silver carp (Hypophthalmichthys molitrix), grass carp (Ctenopharyngodon idella) and big heads (Aristicthys nobilis) are reared in polyculture ponds. (Danovich-Wisconsin)
W80-04148

PHYTOPLANKTON MODELING INVOLVING RANDOM RATE CONSTANTS. PART I: DETERMINISTIC SETTING,
American Univ., Washington, DC.
R. W. Jernigan, and C. P. Tsokos.
The International Journal of Environmental Studies, Vol 14, No 2, p 97-105, 1979. 4 Fig, 15 Ref.

Descriptors: *Phytoplankton, *Model studies, *Primary productivity, *Ecosystems, Sea water, Nutrients, Zooplankton, Stochastic processes, Light intensity, Temperature, Absorption, Predation, Spatial distribution, Euphotic zone, Numerical analysis.

A system of nonlinear deterministic differential equations describe the flow of chemical nutrients through three components of a marine ecosystem, the phytoplankton, zooplankton and stock nutrient in the euphotic zone. The biological activities considered include: nutrient absorption by phytoplankton, extracellular release by phytoplankton, predation by zooplankton, and death and excretion of zooplankton. The parameters governing these activities, such as rates of nutrient uptake, zooplankton excretion and predation, were determined. Light and temperature fluctuations, spatial distributions of organisms, and detritus as the source of zooplankton food were not considered in the model. Through the use of numerical solutions and graphical presentations, the behavior of the model was studied. The most prominent characteristic of the model was the dampened oscillatory behavior of predatory-prey systems. Several parameter configurations were examined to determine their effect on the solutions. It was found that large values of the nutrient uptake coefficient, extracellular release rate and zooplankton death rate, increased the model's oscillatory behavior. The linear deterministic system was also developed in the study. (Harris-Wisconsin)

DISTRIBUTION AND QUANTITATIVE DEVELOPMENT OF AQUATIC MACROPHYTES IN RELATION TO SEDIMENT CHARACTERISTICS IN OLIGOTROPHIC LAKE KALGAARD, DENMARK,
Copenhagen Univ., Hillerod (Denmark). Freshwater Biological Lab.
K. Sand-Jensen, and M. Sondergaard.
Freshwater Biology, Vol 9, No 1, p 1-11, February, 1979. 10 Fig, 6 Tab, 40 Ref.

Descriptors: *Oligotrophy, *Distribution, *Lake Kalgaard(Denmark), *Aquatic plants, *Sediments, *Organic matter, *Submerged plants, Macrophytes, Biomass, Speciation, Nutrients, Carbon dioxide, Adaptation, Ecology, Photosynthesis, Light intensity, Nitrogen, Plant physiology, Organic soils, Organic compounds, Phosphorus, Inorganic compounds, *Denmark.

An increasing sediment organic content at 0-0.75 m depth in Lake Kalgaard, Denmark creates a physiologically richer medium for isoetid plant species. Vegetational biomass, above-ground biomass fraction, and individual plant weight all increase with sediment organic content. At the same time, interstitial carbon dioxide, extractable inorganic nitrogen and exchangeable phosphorus concentrations increase. Kalgaard, a small, 10.5 ha lake with 4.65 m mean depth, was examined October 1975-October 1977. Vegetation is dominated by submerged isoetid species. Emergent and floating-leaved macrophytes are confined to sheltered lake parts with high organic sediments. Submerged species have a high cover area and biomass: Littorella uniflora forms compact stands with 112 g organic dwt/sq m mean biomass; Isoetes lacustris shoots are more scattered but attain 66 g organic dwt/sq m mean biomass. These two species account for 99% of the submerged macrophyte biomass. Littorella dominates 0-2 m zone and Isoetes dominates the 2-4.5 m zone. Littorella has a higher photosynthetic capacity (23 micro g 02/sq cm h) than Isoetes (19.5 micro g 02/sq cm h) at 15C and saturating irradiance. Littorella biomass seasonal variation is small. Lake Kalgaard has only 2.2-2.5 mg N/l. Rosette growth form and great below-ground isoetid biomass (20-65%) are seen as adaptations to oligotropophic ecological conditions such as low inorganic carbon and nutrient concentrations in the water. MAN-INDUCED MODIFICATIONS IN ESTUARIES OF THE NORTHERN GULF OF MEXICO: THEIR IMPACTS ON FISHERY RESOURCES AND MEASURES OF MITIGATION,
Bureau of Land Management, Albuquerque, NM.
R. A. Diener.
In: The Mitigation Symposium: a National Workshop on Mitigating Losses of Fish and Wildlife Habitats, held Fort Collins, CO on July 16-20, 1979. Forest Service General Technical Report RM-65, p 115-120, 1979. 17 Ref.

Descriptors: *Estuaries, *Pollution abatement, *Environmental effects, *Resources development, Powerplants, Oil, Gases, Fisheries, Habitat improvement, *Outer Continental Shelf, Gulf of Mexico.

The commercial and sport fisheries of the Gulf of Mexico are heavily dependent on the estuaries of the northern Gulf coast. A large variety of man-induced modifications in these estuaries are threatening these resources and the quality of the supporting habitat. This report summarizes potential impacts on the habitat and resource for each type of modification and lists mitigative measures which may be taken to offset these impacts. (Sinha-OEIS)

COASTAL IMPACT MITIGATION AND OCS-INDUCED OIL AND GAS DEVELOPMENT: A PERSPECTIVE OF THE CLEAN WATER ACT'S SECTION 404 GUIDELINES,
Environmental Protection Agency, Washington, DC. Office of Water Planning and Standards.
C. R. Terrell, and L. R. Shanks.
In: The Mitigation Symposium: a National Workshop on Mitigating Losses of Fish and Wildlife Habitats, held Fort Collins, CO on July 16-20, 1979. Forest Service General Technical Report RM-65, p 270-275, 1979. 3 Ref.

Descriptors: *Resources development, *Oil pollution, *Ecosystems, *Environmental effects, *Pollution abatement, Water pollution effects, Ecosystems, Coasts, Dredging, Spoil banks, *Outer Continental Shelf, Petroleum industry.

In recent years the petroleum industry has increased its development effort of oil and gas resources on the nation's Outer Continental Shelf (OCS), while concomitantly there has been a rapid increase in coastal development by the petroleum industry and others. Environments and ecosystems have sustained large alterations, leading to reduced productivity and loss of prime fish and wildlife habitat. The Clean Water Act of 1977 Guidelines mandate the examination of practical alternatives to the discharge of dredged or fill material. A general evaluation determines the possibility of a chemically polluted sediment. 'Guidelines to Minimize Impacts' are incorporated concerning the substrate, water quality, tidal fluctuations, currents, salinity and other characteristics. Particular attention must be given to minimize construction impacts to special aquatic sites, such as sanctuaries, refuges, wetlands, vegetated shallows and coral reefs. Based on the Factual Determinations which are made, the Corps of Engineers must decide if the proposed action is in compliance with the S404 Guidelines, and thus whether or not to issue the permit. THE FISHERY CONSERVATION AND MANAGEMENT ACT AS A TOOL FOR MITIGATION IN OUTER CONTINENTAL SHELF PETROLEUM DEVELOPMENT,
Woods Hole Oceanographic Institution, MA. Marine Policy and Ocean Management Program.
A. Rieser, and J. Spiller.
In: The Mitigation Symposium: a National Workshop on Mitigating Losses of Fish and Wildlife Habitats, held Fort Collins, CO on July 16-20, 1979. Forest Service General Technical Report RM-65, p 653-664, 1979. 3 Fig, 60 Ref.

Descriptors: *Resources development, *Environmental effects, *Water pollution effects, Oil pollution, Fisheries, Oil spills, *Outer Continental Shelf, Georges Bank, Petroleum development, Fishery Conservation and Management Act.

Georges Bank, on the Northwest Atlantic Continental Shelf, represents one of the world's most productive fisheries; yet, the adverse environmental effects associated with Outer Continental Shelf (OCS) petroleum development threaten this productivity. Current and proposed regulations applicable to OCS petroleum development inadequately protect critical fishery habitats on the Georges Bank. The Fishery Conservation and Management Act of 1976 (FCMA), through the regional Fishery Management Plans (FMP), provides a process for the definition and protection of these critical fishery habitats. On the Georges Bank, this operation involves the identification of spawning and prime grounds of species of concern and then the inclusion of these areas in the FMPs. Thus, by incorporating such critical areas into a FMP approved by the Secretary of Commerce, these areas would receive special consideration, so that the adverse effects of offshore development on fisheries would be minimized. THE MISSISSIPPI, ALABAMA, FLORIDA, OUTER CONTINENTAL SHELF BASELINE ENVIRONMENTAL SURVEY - MAFLA 1977/1978. VOLUME 1-B. EXECUTIVE SUMMARY REPORT.
Dames and Moore, Los Angeles, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 228, Price Codes: A03 in paper copy, A01 in microfiche. Final Report to Bureau of Land Management, January 1979. 30 p, 16 Fig. AA550-CT7-34.

Descriptors: *Baseline studies, *Environmental effects, *Resources development, Water quality,

Ecosystems, Monitoring, Surveys, *Outer Continental Shelf, Mississippi, Alabama, Florida.

The prime purpose of the MAFLA program was the determination of ongoing or potential impacts on the outer continental shelf (OCS) environment from oil and gas development. The Executive Summary Report is organized along the same lines as the Program Synthesis Report, with sections on methodology, geology, physical oceanography, chemistry and biology. A brief summary and lists of recommended monitoring parameters and major deficiencies in the data base are also included. No attempt has been made to support those lists in detail or uniformly within the text of this volume. However, the reader requiring such backup is referred to Volume I-A from which both lists were derived. (Sinha-OEIS)

OTEC PHYSICAL AND CLIMATIC ENVIRONMENTAL IMPACTS: AN OVERVIEW OF MODELING EFFORTS AND NEEDS,
Argonne National Lab., IL. Energy and Environmental Systems Div.
J. H. Allender, J. D. Ditmars, R. A. Paddock, and K. D. Saunders.
In: Proceedings of: Fifth Ocean Thermal Energy Conversion Conference, held Miami Beach, Florida, February 20-22, 1978, Conf - 780236 Lavi, A. (ed.), p III-165-III-185, September 1978. 2 Tab, 22 Ref.

Descriptors: *Energy conversion, *Thermal powerplants, *Models, *Baseline studies, Resources development, Environmental effects, Thermal pollution, Water pollution, *Outer Continental Shelf, Ocean Thermal Energy Conversion(OTEC).

The present overview of studies of the effects of ocean thermal energy conversion (OTEC) plant operation on the physical environment of the ocean includes a review of the pertinent results of past and contemporary model efforts in terms of their implications for OTEC development and suggestions for future research consistent with OTEC timetables. Particular consideration is given to the areas of utilization of the thermal resource, effects of a single OTEC plant, and aggregate effects of many OTEC plants. These potential effects include modification of the local temperature, salinity, and nutrient distributions, induced changes in mixed-layer depths and sea-surface temperatures, and dispersal of biocides or working fluids (due to leaks). Review of model capabilities and limitations suggests that physical model studies also are needed to meet near-term OTEC needs for predictions of the complex near-field (1-3 km) effects of a single OTEC plant. An estimate for the aggregate effect of many OTEC plants on the horizontal thermohaline structure of the ocean is made in terms of the power density that would be required to sustain an induced, mesoscale anomaly against natural dissipation (as measured in a Gulf Stream eddy). Careful synthesis of the results of several models, in a spatial hierarchy from near-field to basin-wide scales, is required to provide reliable estimates of physical environmental impacts for OTEC purposes. PROGRESS REPORT FOR THE ENVIRONMENTAL IMPACT ASSESSMENT PROGRAM FOR THE 1-MWE EARLY OCEAN TEST PLATFORM,
Interstate Electronics Corp., Anaheim, CA. Oceanic Engineering Div.
M. D. Sands.
In: Proceedings of: Fifth Ocean Thermal Energy Conversion Conference, held Miami Beach, Florida, February 20-22, 1978, Cont - 780236 Lavi, A (ed.), p III-186-III-202, September 1978. 4 Fig, 1 Tab, 12 Ref.

Descriptors: *Energy conversion, *Environmental effects, *Thermal powerplants, Thermal pollution, Biota, Resources development, Gulf of Mexico, Hawaii, Puerto Rico, *Outer Continental Shelf, Ocean Thermal Energy Conversion(OTEC), Environmental impact assessment, Early Ocean Testing Platform.

The 1-MWe Ocean Thermal Energy Conversion Early Ocean Testing Platform (EOTP) has a projected test date in mid-1979 in the Gulf of Mexico, Hawaii, or Puerto Rico. This presentation summarizes the progress to date for the environmental impact assessment program for OTEC-1, the Early Ocean Testing Platform. The considerations in assessing impact for OTEC-1 first require a detailed description of the physical system design. Included in the design description are the depth of intake and discharge pipes, volumes discharged, and applicable safety regulations and procedures. The detailed site descriptive information including the biological, chemical, physical oceanographic and meteorological data must be gathered from all available sources. Particular study areas include the effects of impingement and entrainment, biocide effectiveness and toxicity to nontarget biota, working fluid release effects, climatological impacts, and worker safety. Also, the International, Federal, State, and local legal implications of siting will be considered. While socioeconomic impacts of OTEC-1 now appear to be minimal, there is potential later for substantial benefits to the resident community services. When all relevant data is at hand the predictive process for assessing environmental impact is underway. (Sinha-OEIS)

5D. Waste Treatment Processes

FUNCTIONAL POLYMERS FOR REMOVAL OF HEAVY-METAL POLLUTANTS FROM WATER,
West Virginia Univ., Morgantown. Water Research Inst.
A. Winston, D. G. Kirchner, and J. W. Rosthauser.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158215, Price codes: A03 in paper copy, A01 in microfiche. Information Report 13, 1980. 38 p, 9 Fig, 14 Tab, 49 Ref, 1 Append. OWRT A-031-WVA(1), 14-34-0001-8052.

Descriptors: *Acid mine water, *Cation exchange, *Chelation, *Demineralization, *Heavy metals, *Iron, *Polymers, *Water treatment, Effluents, Heavy metal binding polymers, Industrial wastes, Ion exchange, Mine drainage, Mine water, Waste water treatment, Water pollution, Water treatment.

The project was to design polymeric ion-exchange resins specific for metal ions and particularly for systems for removing iron from water. The resins are vinyl polymers bearing hydroxamic acids and have strong affinity for iron. Polymers were prepared in which the spacing of the hydroxamic acids were varied. The stability constants of the iron complexes showed that the spacing of the hydroxamic acids was important both in complex stability and in the selectivity of the resin for iron. The polymer having the largest binding constant for iron had an 11-atom spacing between hydroxamic-acid groups. This polymer, prepared in an insoluble form, removed to less than 0.5 ppm iron from water. The polymer could be regenerated by washing with sodium hydrosulfite or EDTA. Copolymers bearing hydroxamic acid groups crosslink in the presence of iron, resulting in viscosity increases and flocculation. Polymers for binding copper and mercury were synthesized and evaluated. The functional group for copper was the tripeptide glycylglycylhistidine. For mercury, polymers containing sulfide were studied. Preliminary evaluation showed that the polymers formed complexes with copper and mercury. Various applications of these resins in environment, health, and industry are suggested.

INVENTORY AND EVALUATION OF ELEVATED SAND MOUND SEWAGE DISPOSAL SYSTEMS IN PENNSYLVANIA,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
M. T. Hoover.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158207, Price codes: A05 in paper copy, A01 in microfiche. Master of Science Thesis, March 1979. 78 p, 5 Fig, 7 Tab, 50 Ref. OWRT B-098-PA(1), 14-31-001-7129.

Descriptors: *Sewage disposal, *Pennsylvania, Topsoil, Elevation, Berms, Construction, Soils, Design, Installation, Maintenance, Distribution, Water table, *Septic tanks, Effluent, *Waste water treatment, *Elevated sand mound system, Problem soils, Sandy fill, Malfunctions, Questionnaire, Sewage enforcement officer, Costs.

The elevated sand mound system, which is installed on the soil surface, has been used on problem soils in Pennsylvania since 1974. The purpose of this study was to ascertain the current state-of-the-art of elevated sand mound systems from an inventory of those systems in Pennsylvania, to determine how many were surface discharging, and to identify possible causes of these malfunctions. Questionnaires were sent to 705 sewage enforcement officers in Pennsylvania. Field trips were conducted to determine the rate and causes of surface discharge malfunctions. Most elevated sand mounds are located near densely populated areas and in areas where problem soils predominate. Questionnaire respondents indicated that over 5000 of these systems have been installed at an average cost of $2756. Forty-three percent of the systems in Pennsylvania are malfunctioning or have malfunctioned in the past, costing Pennsylvanians as much as six million dollars over a period of less than four years. The construction of berms was not found to prevent systems from surface discharging over slowly permeable soils. The presently used 10-cm diameter pipe is too large for adequate effluent distribution. Current regulations are inadequate to prevent surface discharge of the system. The design presently used is not flexible enough to accommodate the variety of soil conditions found in Pennsylvania.

RENOVATION OF SEPTIC TANK EFFLUENT IN SAND-CLAY MIXTURES,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
B. P. Willman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158272, Price codes: A06 in paper copy, A01 in microfiche. Master of Science thesis, May 1979, 100 p, 12 Tab, 2 Fig, 31 Ref. OWRT B-098-PA(2), 14-31-0001-7129.

Descriptors: *Waste water disposal, Sands, Clays, Limestones, Shales, Coliforms, Chemical oxygen demand, Conductivity, Pathogenic bacteria, *Septic tanks, Ions, Materials, Particle size, *Effluents, Statistics, Sandstones, *Reclaimed water, *Rehabilation, *Waste water treatment, Sand mounds.

Research was conducted to determine if the clay material in a sandy fill significantly influences the renovation of septic tank effluent. Limestone, sandstone, and shale sands were used alone and combined with 3, 6, and 12 percent clay. Two natural sands also were used. Septic tank effluent was applied to the surface of 10-cm diameter plexiglass columns of all sands for 23 weeks. The effluent was analyzed at regular intervals for 16 chemical and biological variables before and after flowing through 60 cm of the sand. These variables were: pH, chemical oxygen demand, fecal coliforms, fecal streptococci, ammonium-nitrogen, total Kjeldahl nitrogen, nitrite-nitrogen, nitrate-nitrogen, nitrate-nitrite-nitrogen, orthophosphate, total phosphorus, chloride, calcium, sodium, potassium, and specific conductivity. All the sand-clay combinations removed over 99 percent of the fecal coliforms and streptococci. The removal of phosphorus and chemical oxygen demand, and the nitrogen transformations, were efficient in the limestone and shale sands regardless of clay content. The optimum pH for biological activity in the limestone sands rendered added renovating ability. The sandstone sand, a relatively inert material, was significantly influenced by clay content, particularly by the positive influence that the clay had on the pH. The results of the study indicate that limestone is the most desirable sand type, followed by sand-

stone with a small percentage of clay, and then by shale.

QUALITY AND TREATMENT OF WATER INVOLVED WITH COAL SLURRY TRANSPORT BY PIPELINE,
Missouri Univ.-Columbia. Dept. of Chemistry.
S. E. Manahan, J. A. Godwin, and M. H. Shinn.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-160724, Price codes: A03 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, University of Missouri Completion Report, March 1980, 30 p, 14 Fig, 11 Ref. OWRT A-110-MO(2), 14-34-0001-9027.

Descriptors: *Coals, *Slurries, *Transportation, *Pipelines, Coal slurry pipelines, Heavy metals, Leaching, Humic acid, Water quality, Water treatment, Coal-water ratio, Water reuse, Lignite, Bituminous coal.

This document is a report of an investigation of the leaching of metals and organic matter from subbituminous coal and lignite under simulated coal slurry pipeline conditions. The leaching of metals present in the coals was investigated. These metals include iron, calcium, magnesium, aluminum, sodium, potassium, manganese, lead, copper, zinc, cobalt, nickel, chromium, and lithium. After leaching under slurry conditions for 24 hours, lead, cobalt, nickel, and chromium could not be detected in the water by flame atomic absorption. The percentages of the other metals extracted by water under slurry conditions ranged from 0.01 to 75%. The percentage of metal extracted varied widely with the type of metal and with the coal/water ratio in the slurry. Coal humic acids were extracted from coal in approximately 2% slurries and were readsorbed at coal percentages exceeding approximately 5%. These organic substances were shown to be involved in the solubilization of iron, copper, and aluminum.

EVALUATION OF MOUND SYSTEMS FOR PURIFICATION OF SEPTIC TANK EFFLUENT,
Wisconsin Univ.-Madison. Dept. of Soil Science.
C. J. Fitzgerald.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158132, Price codes: A09 in paper copy, A01 in microfiche. M.S. Thesis, 1979. 310 p, 26 Fig, 18 Tab, 112 Ref. OWRT B-099-WIS(2), 14-34-0001-7200.

Descriptors: *Septic tanks, *Efficiencies, *Wisconsin, *Domestic wastes, *Sewage bacteria, Sewage disposal, Sewage treatment, Soil disposal fields, Water pollution source, Coliforms, Streptococcus, Pseudomonas, Viruses, Nutrient removal, Public health, Alternative septic systems, *Mound systems, Environmental sanitation, *Water purification.

Thirty-three mound systems for on-site disposal of septic tank effluent (STE) installed by commercial contractors in Wisconsin were surveyed and monitored for proper design, installation, operation, and wastewater purification. Every system examined was correctly sized and constructed but many systems were being dosed inappropriately with large volumes of STE. In these systems, bacteria and nutrients (N and P) from the STE penetrate deeper into the soil than in systems being properly dosed with more frequent smaller volumes of STE. However all systems removed bacteria, viruses and phosphorus effectively and reduced the N load passing through the soil by nitrification-denitrification. No evidence of contamination by bacteria, N or P could be found in high groundwater near 4 systems located over permeable soils. The pressure system used for STE distribution in Wisconsin mounds prevents the formation of biological crusts where the STE enters the soil, a phenomenon which leads to failure of conventional systems. Three cases of mound system failure reported in the state were due to faulty construction, not improper design or clogging. Wisconsin mound systems are expected to outlive and out perform conventional septic systems. (Harkin-Wis)

LEAST COST SOLUTIONS TO THE PROBLEM OF EFFLUENT ABATEMENT IN URBAN SYSTEMS,
Commerce and Business Administration, Vancouver (British Columbia).
P. N. Nemetz, and H. D. Drechsler.
Water Resources Bulletin, Vol 15, No 5, p 1374-1384, October 1979. 2 Fig, 5 Tab, 11 Ref.

Descriptors: *Systems analysis, *Municipal wastes, *Treatment facilities, *Cost analysis, *Optimization, *Pollution abatement, Economics, Sewage, Costs, Effluents, Marginal costs, Biochemical oxygen demand, Mathematical models, Sewage disposal, Sewage treatment, Alternative planning, Institutional constraints, Political aspects, Urban runoff, Treatment, Cost sharing.

A methodology identifies least-cost treatment systems for waterborne effluents generated within municipalities; the optimal solution entails an appropriate treatment distribution among all dischargers rather than sole reliance on centralized municipal treatment. Currently resources are misallocated because solutions are adopted without adequate evaluation of alternative treatment technologies, distributions of responsibilities for waste treatment and mechanisms for inducing compliance. One of the principal reasons for limited alternative search is the perverse incentives in the current institutional structure. The analysis is conducted in four steps: (1) construction of a systems materials balance; (2) assessment of estimated operating and capital costs of alternative sewage treatment levels; (3) identification of the optimal treatment solution; and (4) delineation and examination of several alternative implementation schemes. A hypothetical municipality with a population of 10,000 people is used. The source and deposition of biochemical oxygen demand is the principal focus; marginal cost curves are derived for different alternatives. Several implementation schemes mechanisms are available to local and regional governments once the optimal treatment solution is identified. Economic incentives could be employed to induce each a major polluter to treat wastes to the level desirable from a system-wide perspective. (Danovich-Wisconsin)

BENEFIT ANALYSIS FOR COMBINED SEWER OVERFLOW CONTROL.
EPA Technology Transfer Seminar Publication, EPA-625/4-79-013, April 1979. 54 p, 19 Fig, 8 Tab, 20 Ref.

Descriptors: *Cost-benefit analysis, *Combined sewers, *Combined sewer overflows, *Control, *Mathematical models, *Water pollution control, *Water quality control, Sewers, Overflow, Overflow control, Pollution sources, Stormwater models, Stormwater discharge, Stormwater, Technology, Sewage system, Collection system, Legislation.

Combined sewers are collection systems that combine both sanitary sewage and stormwater. They are typically found in older cities. Combined sewer overflows occur during or after storm events and their volumes and frequency are related to the rainfall patterns; they occur at discrete overflow points; and they contain the constituents found both in urban stormwater and in sanitary sewage. The result of an overflow can be significant discharge of organic material, nutrients, sediment, microorganisms, oil and grease, and metals and other potentially toxic substances into the receiving water. Benefit analysis is concerned with identifying the effects of overflows and the anticipated results of effecting change in them. There are two types of mathematical models useful in combined sewer overflow control planning--stormwater models and receiving water quality models. Stormwater models are tools to estimate or predict the volume of stormwater discharge and the loadings of its constituent pollutants. Receiving water quality models predict or simulate the effects of pollutant sources on the quality of the body of water into which they are discharged. Technologies to control pollution from combined sewer overflow can be grouped into three main categories: source controls to reduce the amount of pollutants entering the sewer system, collection system control to improve the system's effectiveness in storing and handling the flows, and off-line storage and treatment to remove pollutants from combined sewer flows. W80-04165

LAND TREATMENT OF MUNICIPAL WASTEWATER EFFLUENTS: DESIGN FACTORS-I.
EPA Technology Transfer Seminar Publication, January 1976. 49 p, 3 Fig, 13 Tab, 37 Ref.

Descriptors: *Municipal wastes, *Waste disposal, *Waste water treatment, *Irrigation, *Land treatment, *Land application, *Design criteria, Wastes, Wastewater, Disposal, Sewage, Infiltration-percolation, Overland flow, Effluents, Sewage treatment, Sewage effluents, Land use, Design data.

Land application of wastewater or treated effluent involves the use of plants, the soil surface and the soil matrix for removal of certain wastewater constituents. The three basic methods of land application are irrigation, infiltration-percolation, and overland flow--irrigation being the predominant method in use today. Prior to land application, treatment of wastewater may be necessary in order to maintain a reliable distribution system, avoid nuisance conditions, maintain high infiltration rates, and so that the irrigated crops can be used for human consumption. The suitability of the land is judged by its location to the wastewater collection/treatment facilities; compatibility of planned objectives with overall land use plan; proximity to surface waters; and number and size of available land parcels. Other characteristics that should be considered are climate, topography, vegetation and geology and soils. For irrigation, land treatment distribution techniques can be classified into three main groups: fixed sprinkling systems, moving sprinkling systems and surface application systems. Comprehensive monitoring programs are required to ensure that proper renovation of wastewater is occurring and that environmental degradation is not occurring. (See also W80-04167) (Iervolino-NC)
W80-04166

LAND TREATMENT OF MUNICIPAL WASTEWATER EFFLUENTS: DESIGN FACTORS-II.
EPA Technology Transfer Seminar Publication, January 1976. 72 p, 22 Fig, 10 Tab, 42 Ref.

Descriptors: *Municipal wastes, *Waste disposal, *Waste water treatment, *Irrigation, *Land treatment, *Land application, *Design criteria, Wastes, Wastewater, Disposal, Sewage, High-rate irrigation, Overland flow, Infiltration-percolation, Effluents, Sewage treatment, Sewage effluents, Land use, Design data.

Land treatment or land application is the treatment of wastewater by using plant cover, soil surface, soil profile and geologic materials to remove cer-

tain wastewater pollutants. The main concern about this method is the possible harmful effects of the pollutants on the vegetation, soil and surface and groundwaters. Four possible processes successfully used are overland flow, irrigation, high-rate irrigation, and infiltration-percolation. Factors affecting site selection include soil, geology and groundwater, land use, sensitive environmental areas, water rights, the land application process, topography, and political boundaries and land ownership. For each process the effluent loading rate may be limited by the following constraints: infiltration capacity, soil permeability, soil and plant capacity to remove nitrogen and phosphorous, soil capacity to filter and assimilate suspended solids, soil capacity to remove and oxidize BOD and COD, soil capacity to remove and assimilate inorganic chemicals, discharge requirements to groundwater and surface water, and climatic influences such as precipitation, evapotranspiration and growing season. Components of land application systems include transport, preapplication treatment, storage, distribution, irrigation, surface drainage, subsurface drainage, buffer area and monitoring system. (See also W80-04166) (Iervolino-NC)
W80-04167

LAND TREATMENT OF MUNICIPAL WASTEWATER EFFLUENTS: CASE HISTORIES.
EPA Technology Transfer Seminar Publication, EPA-625/4-76-010, January 1976. 79 p, 13 Fig, 29 Tab, 36 Ref.

Descriptors: *Municipal wastes, *Waste disposal, *Waste water treatment, *Land treatment, *Sewage treatment, *Effluents, Wastes, Disposal, Treatment facilities, Irrigation, Infiltration, Wastewater reclamation.

In recent years, a number of experimental/operational systems have been designed to renovate wastewater by land application. This publication presents case histories of five properly managed systems of land application of municipal wastewater. The five facilities considered are: (1) the Michigan State University Water Quality Management Project (WQMP); (2) the City of Tallahassee Spray Irrigation Project (TSIP); (3) the Flushing Meadows Project (FMP); (4) the Pennsylvania State University Wastewater Renovation and Conservation Project (WRCP); and (5) the City of Boulder (CO) Project (BCP). Three of these were designed initially as pilot plants to provide alternative methods of wastewater removal from currently operating plants. The Michigan State University WQMP was designed exclusively as a research and development project to study alternative aquatic and terrestrial applications of wastewater to utilize the components as food for plants and animals. At Boulder, Colorado, the impetus for the BCP was that land treatment showed an economic advantage. Two of the programs--WQMP and WRCP--have seasonable variables that affect their operation, whereas year-round operation is possible at TSIP and FMP. The Flushing Meadows project pumps the water into infiltration basins from which it is rapidly absorbed into the soil instead of a spray irrigation system which the City of Tallahassee uses. The Pennsylvania State University WRCP was initiated to evaluate alternative methods of preventing further eutrophication of a stream that received effluent from a sewage treatment plant. STATUS OF OXYGEN-ACTIVATED SLUDGE WASTEWATER TREATMENT.
EPA Technology Transfer Seminar Publication, EPA 625 4-77-003a, October 1977. 46 p, 17 Fig, 20 Tab, 6 Ref.

Descriptors: *Waste water treatment, *Oxygen-activated sludge treatment, *Water pollution treatment, *Sludge treatment, *Second Generation Open Reactor Oxygen System(MAROX), *Sewage effluents, Treatment, Sewage treatment, Waste water disposal, Water treatment, Wastes, Effluents.

The use of oxygen gas in the activated sludge process has evolved in the last eight years from a level of primarily academic interest to a point of broad application and implementation especially in North America and Japan. By 1980 it is projected that 150 oxygen systems will be in operation; as of June 1976 50 plants were in operation. Oxygen dissolution concepts include both covered and open reactor alternatives. Included in this study is a description of the second generation open reactor oxygen system (MAROX) for which there are two versions: one utilizing rotating active diffusers (RADs), the other fixed active diffusers (FADs). Presently the second generation RAD design appears to be a significant cost-effective improvement compared to the original FAD design. Evaluation of the MAROX system was done by the Metropolitan Denver (CO) Sewage Disposal District No. 1 funded by the U.S. Environmental Protection Agency. This document also summarizes the operating and performance data for 11 oxygen-activated sludge plants. Eight of the selected plants treat municipal wastewater and three are strictly industrial applications. The reactor designs for these plants represent a variety of configurations including both rectangular-stage systems and systems incorporating circular and acurate stages within larger self-contained circular tanks. UTILIZATION OF NATURAL ECOSYSTEMS FOR WASTEWATER RENOVATION,
Michigan State Univ., East Lansing. Inst. of Water Research.
T. M. Burton, D. L. King, R. C. Ball, and T. G. Bahr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-100431, Price codes: A08 in paper copy, A01 in microfiche. Report EPA-905/3-79-003 prepared for Region V, Great Lakes National Program Office, U.S. Environmental Protection Agency, Chicago, April 1979. 155 p, 50 Fig, 6 Ref. 4005065.

Descriptors: *Water renovation, *Wastewater treatment, *Experimental facilities, *Municipal wastes, *Sewage treatment, *East Lansing(MI), *Ecosystems, Effluents, Sewage effluents, Waste water reclamation, Water reuse, Transmission lines, Phosphorus, Lakes, Biomass, Nitrogen, Forage crops, Land treatment, Irrigation.

This study describes the uses for a permanent facility constructed in the vicinity of the City of East Lansing, MI for the experimental recycling, treatment, and reuse of municipal sewage effluent on a 500 acre site on the campus of Michigan State University. The facility provides for diversion of up to 7570 cubic m/day of secondary effluent from the East Lansing activated sludge treatment plant. This waste flow is directed away from the receiving stream to an intensely managed aquatic and terrestrial nutrient recycling system. The facility consists of a portion of the wastewater treatment plant, a transmission line, a lake system of four experimental lakes, and a spray irrigation system. The four lakes used were found to significantly decrease effluent phosphorus load, nitrogen, alkalinity, and coliform bacteria. Forage crops were highly efficient in the uptake of nitrogen and phosphorus from wastewater and have the potential of renovating up to 7.5 cm/week of wastewater. Recommendations included spraying all water effluent on irrigated land and discharging none into the lakes, establishment of better biomass baseline data, managing the lakes so that nitrogen is stripped from incoming wastewater, and avoiding spraying high nitrogen wastewater in older forests since removal efficiency is low. Continued research needs are set out. (Arnold-NC)

5E. Ultimate Disposal Of Wastes

SOIL SUITABILITY FOR ON-SITE WASTE DISPOSAL: DEVELOPMENT OF GENETICALLY MARKED ESCHERICHIA COLI STRAINS AS TRACERS OF SUBSURFACE WATER FLOW,
Oregon State Univ., Corvallis. Water Resources Research Inst.
C. Hagedorn, and E. L. McCoy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-160369, Price codes: A05 in paper copy, A01 in microfiche. Completion Report WRRI-65, November 1979. 81 p, 12 Fig, 6 Tab, 132 Ref. OWRT A-039-ORE(2).

Descriptors: *Subsurface flow, *Waste disposal, *Tracers, *Soil properties, Permeability, *Septic tanks, Effluents, *Path of pollutants, Bacteria, Saturated soils, Oregon, *Escherichia coli, Willamette Valley area(Oregon).

This study was undertaken to determine whether or not public health hazards could be created when septic-tank drainfield trenches became submerged under seasonal perched water tables on hillslope soils adjacent to the Willamette Valley, Oregon. The research results indicated that such hazards can occur when fecal bacteria are displaced under saturated flow conditions and transported downslope with resulting water contamination. The major research findings include: (1) Fecal organisms were transported, via saturated subsurface flow, for longer distances and over shorter periods of time than was expected or previously reported, (2) Antibiotic-resistant strains of Escherichia coli were found to be suitable as tracers of subsurface water flow through saturated soil profiles in western Oregon, (3) Fitting the data to dispersion equations indicated that dilution and dispersion were the major parameters controlling bacterial translocation under saturated conditions. Adsorption and filtration were minor considerations as long as soil

saturation was maintained, (4) Different organisms (bacteria and viruses) were transported through the saturated soils at rates equivalent to the speed of water flow. At this level the size of the particles which were transported was not a factor in the dynamics of subsurface translocation.

Descriptors: *Water treatment, *Filtration, *Polymers, Dosage selection, Cation exchange, Velocity gradient, Head loss, Floc breakup, High shear, *Turbidity removal, *Polyelectrolytes.

Laboratory investigations were carried out to determine the type and dosages of polymers best suited for direct filtration. Viscosity and conductivity measurements were found to be unreliable methods for determining dosages. Low to medium weight cationic polymers (M.W.= 1 x 10 to the fourth power to 1 x 10 to the fifth power) were found to be ideally suited for the direct filtration of low turbidity waters. The principal mode of interaction was adsorption and charge neutralization for these polymers. The best method of determining dosage was the jar test, using rapid mixing only at high liquid shear, followed by particle size analysis. For high molecular weight polymers bridging appears to be the primary mechanism of polymer action. Standard jar tests do not provide the high G's necessary to obtain the optimum mixing of polymers. Specifically, a maximum G of 300 sec-1 was required during rapid mixing of polymers with molecular weight in the neighborhood of 5x10 to the fourth power. The duration of mixing may vary from 3 to 8 minutes depending on the molecular weight, with large molecular weight polymers requiring less time, presumably because of fast adsorption and bridging. The ccc and the optimum dosages for flocculation were exponentially correlated with the charge density per molecule of the polymer. In filtration, flocs captured within the pores are liable to be subjected to high shear as the bed becomes clogged. This may cause breakup and dislodgement of predeposited flocs, which ultimately would breakthrough, much the same way desorption of solutes occur. For optimum filtering conditions, breakup occurred when G in the clogged bed exceeded 700 sec-1. The particle size distribution data clearly demonstrated the in situ flocculation within the filter bed, followed by breakage when G became large due to clogging.

POSSIBLE RELATION BETWEEN PHYTOPLANKTON NUMBERS AND SAPROLEGNIOID FUNGI IN SHATT AL-ARAB NEAR BASRAH, IRAQ,
Basrah Univ., Al Basrah (Iraq). Dept. of Biology.
H. A. Al-Saadi, S. S. Rattan, T. W. Muhsin, and H. A. Hameed.
Hydrobiologia, Vol 63, No 1, p 57-62, March 1979. 3 Fig, 1 Tab, 18 Ref.

Descriptors: *Iraq, *Shatt Al-Arab River(Iraq), *Fungi, *Phytoplankton, *Correlation analysis, Seasonal, Hydrogen ion concentration, Dissolved oxygen, Salinity, Biological communities, Growth rates, Diatoms, Speciation, Benthic flora, Algae, Population, Decomposing organic matter, Biodegradation, Water temperature.

Phytoplankton numbers correlate negatively with decomposing fungi, Saprolegniaceae, in Shatt Al-Arab River near Basrah, Iraq as measured September 1976-August 1977. During peak phytoplankton growth periods, fungi occurrence is minimal and during minimum phytoplankton growth periods, fungi are abundant. This relationship is significant throughout the year except in July-August when both phytoplankton and fungi numbers decrease due to unfavorable high temperatures. Fungi depend on phytoplankton as substrate which becomes available after phytoplankton decline and decay. Saprolegnioid fungi seasonal variation is independent of pH, salinity and dissolved oxygen. pH range fluctuates 7.0-8.0, salinity 0.74-1.04 ppt. Dissolved oxygen is usually saturated although it varies with temperature. However, fungi abundance significantly correlates with temperature. Phytoplankton maxima occur in October-November, March and June. Populations are dominated by benthic forms and dominant species are diatoms especially pinnate diatoms (74.76%). Green and blue-green algae are only 10.28% and 14.01%, respectively. Cyclotella meneghiniana dominates. Fungi maxima occur in January, April and September. Of 10 species, four belong to Saprolegnia, five to Achlya and one to Dictyuchus. (Danovich-Wisconsin)

PHOSPHATASE ACTIVITY AND ITS ROLE IN THE MINERALIZATION OF ORGANIC PHOSPHORUS IN COASTAL SEA WATER,
Tokyo Univ. (Japan). Ocean Research Inst.
H. Kobori, and N. Taga.
Journal of Experimental Marine Biology and Ecology, Vol 36, No 1, p 23-39, January 1979. 8 Fig, 3 Tab, 30 Ref.

Descriptors: *Cycling nutrients, *Phosphorus, *Bays, *Japan, *Bacteria, *Enzymes, Decomposing organic matter, Coasts, Biomass, Heterotrophy, Phytoplankton, Organic compounds, Biodegradation, Inorganic compounds, Degradation(Decomposition), Water chemistry, Biochemistry, Sea water, Primary productivity, Marine bacteria, Tokyo Bay(Japan), Sagami Bay(Japan), Suruga Bay(Japan).

Investigations of the role of phosphatase in mineralizing natural organic phosphorus in eutrophic Tokyo Bay and less eutrophic Sagami and Suruga Bays, Japan coastal waters, July 1973 and August 1977, demonstrate that phosphatase enzymes play a significant role in phosphorus regeneration in Tokyo Bay and especially in Sagami Bay. Alkaline phosphatase in Tokyo Bay is associated with bacterial biomass and closely parallels heterotrophic bacteria counts. Phosphatase activity also correlates with chlorophyll-a concentrations; therefore, bacteria and phytoplankton make major contributions to phosphatase production in Tokyo Bay. Organic phosphorus accounts for 48% of total phosphorus in Tokyo Bay (0-20 m) and 87% and 98% in surface waters (0-20 m) in Sagami and Suruga Bays, respectively. Phosphatase-hydrolysable organic phosphorus makes up 19% of organic phosphorus in the Tokyo Bay water column and 50% in Sagami Bay euphotic zone. In euphotic zones, phosphatase-hydrolysable organic phosphorus decomposes completely, suggesting that this organic fraction is recycled by primary production. Inorganic phosphorus released by phosphatase action makes up less than 10% of inorganic phosphorus present in Tokyo Bay and 67% in Sagami Bay. Therefore, phosphatase-hydrolysable organic phosphorus plays an important role as an inorganic phosphorus source in Sagami Bay. (Danovich-Wisconsin)

Flaming Gorge was created in 1962 by damming the flow of the Green River in northeastern Utah. The reservoir watershed covers approximately 10,000 sq miles, and was built for two purposes: (1) Storage of water for irrigation, power generation, and municipal and industrial water supplies; (2) Water-based recreational opportunities such as swimming, fishing, boating. Eutrophication has been accelerated in Flaming Gorge Reservoir through human interference, and has produced negative effects on recreational opportunities. Algal mats, a side product of eutrophication, have been interfering with boating and swimming. The trout population decreased from 84% of the total fish population in 1964 to 9% in 1969, while non-game fish populations have correspondingly increased. The main cause of the accelerated eutrophication is high phosphorus levels. The phosphorus contribution from point and nonpoint sources is estimated at 575 tons/year, with natural and man-made erosion contributing the highest phosphorus percentage (87%), followed by municipal wastewater discharges (11%), and urban and septic tank runoff (2%). To maintain phosphorus concentrations within permissible levels would require an 80% reduction in the present phosphorus loading. However, natural erosion, the main phosphorus contributing factor may not be controllable. (Harris-Wisconsin)

GROWTH AND POPULATION STUDIES ON TILAPIA GALILAEA IN LAKE KINNERET,
Israel Oceanographic and Limnological Research Ltd., Haifa.
R. Landau.
Freshwater Biology, Vol 9, No 1, p 23-32, February 1979. 1 Fig, 6 Tab, 25 Ref.

Descriptors: *Algal control, *Eutrophication, *Population, *Fish populations, *Lake Kinneret(Israel), Tilapia galilaea, Peridinium cinctum, Aquatic productivity, Nuisance algae, Water quality control, Fish establishment, Fish harvest, Fish farming, Fish reproduction, Life cycles, Growth rates, Life history studies, *Israel.

This study assessing stock size of endemic cichlid fish Tilapia galilaea in Lake Kinneret, Israel is prompted by earlier suggestions that water quality in this otherwise-unpolluted lake be maintained by using the fish to control algal blooms. Because the fish feeds selectively on bloom organism, Peridinium cinctum, the fish is considered useful in controlling the algae if enough fish population are maintained through stocking. It is suggested that recruitment of stocked fish can be increased by introduction in December and by use of fingerlings which can grow to marketable size in less than two seasons. Between 1967-1977 catches of this commercially taken fish dropped from an annual average of 200 t to 70 t, then increased to their original level. Assuming a natural mortality of 0.94, total stock size averaged 300-700 t during 1970-1976, while recruitment averaged 0.7-3 million/yr. Three broods hatched during relatively high water levels 1970-1972 yielded especially low recruitment. The Von Bertalanffy growth coefficient is estimated at 0.67 and final length at 25-36 cm. First year growth, 23-152 cm, is closely related to final length which in turn is affected by genetic variations in the total population. Changes in proportions of fast-growing and slow-growing fish cause yearly fluctuations in size distribution. Recruitment to the fishery, at 17-20 cm, occurs between 1+ and 3+ years of age. Highest growth rates for year-old fish, 1-2% mean wt/day, occurs April-May, the Peridinium season. During July only a small proportion of year-old fish reach marketable size, because of a diminishing food supply. (Harris-Wisconsin)

THE CODORUS CREEK WASTEWATER MANAGEMENT STUDY--ANALYSIS OF CONCLUSIONS: SUMMARY OF FINDINGS AND RECOMMENDATIONS.
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 851, Price codes: A03 in paper copy, A01 in microfiche. April 1973. 30 p, 5 Fig, 26 Tab.

Descriptors: *Water resources planning, *Waste water treatment, *Water management(Applied), *Water pollution control, *Economic analysis, *Codorus Creek(PA), *Water quality, Economics, Social aspects, Water pollution, Water use, Comprehensive planning, Pennsylvania, Primary treatment, Secondary treatment, Tertiary treatment, Alternative planning, Water reuse.

This is a summary of the findings and recommendations of the District Engineer for the wastewater management system study for the Codorus Creek Basin, a 280 square mile portion of the Susquehanna River Basin in Southeastern Pennsylvania. The Codorus stream system is severely degraded. The District Engineer's specific recommendations include adoption of one of three of the six alternative plans--the December Plan, the Basic All Land Plan, or the Basic All Water Plan; establishment of a county wastewater management authority to carry out detailed planning for and supervision of implementation of the selected plan, and to pursue industrial reuse of wastewater effluents; development of a stormwater management plan; and immediate implementation of the selected plan. The report outlines the problems, study objectives and methodology. The six alternative plans are described: the Plan to Meet Current Standards, the December Plan, the Basic and Modified All Water Plans, and the Basic and Modified All Land Plans. A reuse option would be applicable to any of these plans. The Summary of Findings includes proposals for ways for these plans to meet requirements of the Federal Water Pollution Control Act Amendments, P.L. 92-500, as well as a discussion of environmental, social, and economic impacts of each alternative plan. The effects of each of the alternative plans are organized in terms of 'premise sets' to facilitate choice among the plans, focusing on four of the plans. (Arnold-NC)

THE CODORUS CREEK WASTEWATER MANAGEMENT STUDY--APPENDIX A. TECHNICAL STUDIES. VOL. I.
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 853, Price codes: A04 in paper copy, A01 in microfiche. August 1972. 70 p, 27 Exhibits.

Descriptors: *Water resources planning, *Waste water treatment, *Water management(Applied), *Water pollution control, *Economic analysis, *Codorus Creek(PA), *Water pollution, *Water supply, *Water quality control, *Water quality, Economics, Social aspects, Water use, Comprehensive planning, Pennsylvania.

The Codorus Creek Wastewater Management study was undertaken to recommend actions necessary to improve significantly the water quality of the creek in order to provide a basis for restoration of natural environmental values and enhancement of the economic and social needs of the people. The Codorus stream system, which is severely degraded, covers 280 square miles in southern Pennsylvania. This appendix defines the study area. Current demographic and economic conditions are outlined, including present population distribution and the levels of area economic activity. Geophysical resources discussed include the basin's geology, hydrogeology, soils, and hydrology. Surface water supply management systems and their development are examined, and present wastewater management systems are described including municipal, manufacturing-commercial, and private systems; irrigation with wastewater; waste loadings; stormwater and combined sewer effects; and management of sludge solids. Water quality conditions are discussed and analyzed. Physical, chemical and biological conditions are described and the principal water quality problems are identified. A summary of existing water quality conditions is included. (Arnold-NC)

THE CODORUS CREEK WASTEWATER MANAGEMENT STUDY--APPENDIX A. TECHNICAL STUDIES. VOL. II.
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 854, Price codes: A03 in paper copy, A01 in microfiche. August 1972. 47 p, 19 Exhibits.

Descriptors: *Water resources planning, *Waste water treatment, *Water management, *Water pollution control, *Economic analysis, *Codorus Creek(PA), *Water quality control, *Water quality, Economics, Social aspects, Water use, Water demand, Comprehensive planning, Pennsylvania, Primary treatment, Secondary treatment, Tertiary treatment, Industry, Projections, Economics.

The Codorus Creek Wastewater Management study was undertaken to recommend actions necessary to improve significantly the water quality of the creek in order to provide a basis for restoration of natural environmental values and enhancement of the economic and social needs of the people. The Codorus stream system, which is severely degraded, covers 280 square miles in southern Pennsylvania. The purpose of this appendix is to identify and evaluate future water resource-wastewater management needs based on assessments of future area growth and environmental management objectives. Demographic and economic growth trends are presented for the area. Population forecasts are made through the year 2020; population is expected to double from 1970 to 2020. Wastewater flow projections are made for

domestic wastewater and manufacturing and commercial wastewater systems. These systems are expected to change in mix from 50%-50% in 1970 to 70% domestic-30% manufacturing-commercial by the year 2000. Future water supply demand on the area's system will depend upon the future mix of domestic and manufacturing-commercial uses as well as upon the availability of supplies for those uses. Water quality management objectives for the area are discussed. Water quality criteria for streams are presented. Existing management action includes a pollution abatement implementation plan. The long-range effects of the plan are summarized and water nutrient reduction relationships are discussed. Further removal of nitrogen and phosphorous is necessary to obtain water quality conditions satisfactory for multiple use objectives. Nitrogen reduction should be 90% or greater, and phosphorous reduction, 95-98%. (Arnold-NC)

THE CODORUS CREEK WASTEWATER MANAGEMENT STUDY--APPENDIX A. TECHNICAL STUDIES. VOL. III.
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 855, Price codes: A10 in paper copy, A01 in microfiche. August 1972. 208 p, 17 Fig, 52 Tab, 20 Exhibits, 30 Ref.

Descriptors: *Water resources planning, *Waste water treatment, *Water management(Applied), *Water pollution control, *Economic analysis, *Codorus Creek(PA), *Water pollution, *Water quality, *Land treatment, Economics, Social aspects, Water use, Comprehensive planning, Pennsylvania, Cost analysis, Management alternatives, Treatment facilities, Water reuse, Sludge disposal, Costs.

The Codorus Creek Wastewater Management study was undertaken to recommend actions necessary to improve significantly the water quality of the creek in order to provide a basis for restoration of natural environmental values and enhancement of the economic and social needs of the people. The Codorus stream system, which is severely degraded, covers 280 square miles in southern Pennsylvania. This appendix investigates wastewater management for industrial and municipal discharges to the Codorus Creek Basin. Wastewater flow projections were developed for each of the 16 service areas for the years 1980, 1990, 2000 and 2020. Total wastewater flows are projected to increase 165% in the year 2000 over current levels. Water quality management objectives are presented for the study area in terms of water quality stream standards, existing action plans, and water quality performance criteria. Technological alternatives for wastewater system design are examined. The basic technologies available to meet long-range objectives encompass advanced water process treatment and land treatment through irrigation. Performance capabilities of these systems are evaluated for cost and performance relationships relative to present and long-range water quality management objectives. Physical characteristics are examined for suitability for wastewater applications. Water reuse is examined as an alternative for conservation of available water supplies and maintenance or enhancement of stream flows. Five of the most promising wastewater system management alternatives are analyzed and cost evaluations presented for each alternative. (Arnold-NC)

THE CODORUS CREEK WASTEWATER MANAGEMENT STUDY--APPENDIX A. TECHNICAL STUDIES. VOL. IV.
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 856, Price codes: A12 in paper copy, A01 in microfiche. August 1972. 266 p, 7 Fig, 57 Tab, 35 Exhibits.

Descriptors: *Water resources planning, *Waste water treatment, *Water management(Applied), *Water pollution control, *Economic analysis, *Codorus Creek(PA), *Water reuse, *Land treatment, Economics, Social aspects, Water quality, Water use, Comprehensive planning, Pennsylvania, Primary treatment, Secondary treatment, Tertiary treatment, Stormwater management, Treatment facilities, System design, Sludge disposal, Costs, Maintenance costs, Operating costs.

The Codorus Creek Wastewater Management study was undertaken to recommend actions necessary to improve significantly the water quality of the creek in order to provide a basis for restoration of natural environmental values and enhancement of the economic and social needs of the people. The Codorus stream system, which is severely degraded, covers 280 square miles in southern Pennsylvania. Analysis of wastewater management problems and possible solutions led to formulation and analysis of a broad range of technology and design alternatives. These encompassed a range of specific solutions advocated for the area and basic technology choices for achieving high wastewater management standards, alternative levels of performance capability and a broad range of constitutional management choices. This appendix considers five specific alternative plans: (1) Plan to Meet Current Standards; (2) All Water Treatment Plan; (3) All Land Treatment Plan; (4) December Plan--a combination of the All Water and All Land Plans; and (5) Reuse Plans. Facilities plans and projected costs are presented for each plan. Sludge management and industrial wastes management plans are also presented. Three options are discussed for the Reuse Plan. A Stormwater Management Plan is presented for the Basin including operation and maintenance costs for the plan. (Cooper-NC)
W80-04176

THE CODORUS CREEK WASTEWATER MANAGEMENT STUDY. APPENDIX B. IMPACT STUDIES.
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 857, Price codes: A08 in paper copy, A01 in microfiche. August 1972. 164 p, 16 Fig, 14 Tab, 98 Ref.

Descriptors: *Water resources planning, *Waste water treatment, *Water management(Applied), *Water pollution control, *Economic analysis, *Codorus Creek(PA), *Water quality, Economics, Social aspects, Water use, Comprehensive planning, Pennsylvania, Aquatic ecology, Terrestrial ecology, Public health, Benthic organisms, Social impacts, Economic impacts, Environmental impacts.

The Codorus Creek Wastewater Management study was undertaken to recommend actions necessary to improve significantly the water quality of the creek in order to provide a basis for restoration of natural environmental values and enhancement of the economic and social needs of the people. The Codorus stream system, which is severely degraded, covers 280 square miles in southern Pennsylvania. This appendix describes the assessment and evaluation of impacts of several alternative wastewater management plans for the Basin. The four basic plans were (1) a decentralized water-oriented system, (2) a centralized water-oriented system, (3) a combination water-land system, and (4) an industrial reuse water-land system. Six impact areas were selected: economic, social, aquatic ecology, terrestrial ecology, visual, and public health risk. Within the economic and social impact areas, short- and long-term economic stimulation, employment, housing and public service, leisure opportunities, agriculture, land use, land values and visual (direct and indirect) impacts were considered. All four plans would have positive effects on short- and long-term economic stimulation, employment, leisure opportunities, and aquatic ecology. Plans (3) and (4) would have negative effects on housing and public service, land values and direct visual impacts. All four alternatives would greatly enhance the indirect visual-resultant water quality attributes of the Creek. Aquatic ecology would be enhanced, with a decrease in potential eutrophication. Terrestrial ecology impacts would be positive; management of interceptor rights-of-way could be handled to provide low level vegetation for small game habitats. All alternatives should reduce microbial contamination but land disposal might have adverse public health effects. (Cooper-NC)

THE CODORUS CREEK WASTEWATER MANAGEMENT STUDY. APPENDIX C. ANALYSIS OF INSTITUTIONAL ARRANGEMENTS.
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 858, Price codes: A03 in paper copy, A01 in microfiche. August 1972. 45 p, 5 Fig, 3 Tab, 4 Attachments.

Descriptors: *Water resources planning, *Wastewater treatment, *Water management(Applied), *Water pollution control, *Economic analysis, *Codorus Creek(PA), *Water quality, Economics, Social aspects, Water pollution, Water use, Comprehensive planning, Governments, Institutional arrangements, Legal aspects, Financial aspects.

The Codorus Creek Wastewater Management study was undertaken to recommend actions necessary to improve significantly the water quality of the creek in order to provide a basis for restoration of natural environmental values and enhancement of the economic and social needs of the people. The Codorus stream system, which is severely degraded, covers 280 square miles in southern Pennsylvania. This appendix presents an overview of the interrelationship of various agencies which will be involved in implementing and managing any given wastewater treatment alternatives in the Basin. There are currently 14 existing wastewater management authorities in the study area. Some kind of unifying institution would have to be established to provide centralized leadership for basin-wide action on wastewater. Legal analysis for expanding present or developing new institutions is presented. This analysis discusses municipal powers for construction and operation of wastewater treatment facilities, including the formation of water authorities and land acquisition powers. Four institutional alternatives are presented, along with probable impacts, ranging from total decentralization to complete centralization; these alternatives are discussed within existing and pending legislation. Potential sources of financial assistance are examined, including Federal, state and local programs. Conclusions indicate that the most attractive institutional arrangement for wastewater management in the Basin would be a County Wastewater Authority. (Arnold-NC)

THE CODORUS CREEK WASTEWATER MANAGEMENT STUDY. SUPPLEMENT TO APPENDIX C. IMPLEMENTING A LAND-BASED SYSTEM--AN ANALYSIS OF APPROACHES.
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 859, Price codes: A02 in paper copy, A01 in microfiche. August 1972. 24 p, 8 Tab.

Descriptors: *Water resources planning, *Waste water treatment, *Water management(Applied), *Water pollution control, *Economic analysis, *Codorus Creek(PA), *Water quality, Economics, Social aspects, Wastewater irrigation, Water pollution, Water use, Comprehensive planning, Pennsylvania, Land management, Land treatment.

The Codorus Creek Wastewater Management study was undertaken to recommend actions necessary to improve significantly the water quality of the creek in order to provide a basis for restoration of natural environmental values and enhancement of the economic and social needs of the people. The Codorus stream system, which is severely degraded, covers 280 square miles in southern Pennsylvania. This volume provides additional information with regard to implementing a land-based wastewater management system in the Basin. Alternatives for land acquisition and management are discussed and action proposals are made involving individual and joint municipal efforts, formation of a municipal authority, or contracting with a private corporation for development of the

system. Land-spreading alternatives for wastewater in York County are examined in relation to existing farm size, ownership, and farm operator information. A particular area, Census Tract 217, is mentioned as a candidate for irrigation of treated wastewaters. Various potential management concepts are outlined to meet stated goals of minimizing human relocation due to plant construction, maintaining or improving the local tax base, stabilizing rural community values, and increasing on-farm income by land spreading. (Arnold-NC)

WATER QUALITY AND MINING: A MANAGEMENT PLAN.
North Carolina Dept. of Natural Resources and Community Development, Raleigh. Div. of Environmental Management.
December 1979. 59 p, 8 Fig, 4 Tab, 24 Ref.

Descriptors: *Water quality, *Mining, *North Carolina, *North Carolina Mining Act of 1971, *Sedimentation, *Mine wastes, *Sedimentation control, *Water pollution sources, Mines, Water management(Applied), Planning, National Pollutant Discharge Elimination System, Pollutants, Pollution, Erosion, Waste disposal, Pollution control, Nonpoint source pollution.

This document is an assessment of mining practices in North Carolina and their effects on water quality. Of the 507 mines in the State that affected more than 11,695 acres of land in 1978, all but one produced non-metallic minerals and no coal mining was undertaken. The control and treatment of point source discharges from mining operations has been greatly improved through the National Pollution Discharge Elimination System and the State's Mining Act of 1971. Potential adverse effects of mine operations include acid drainage, drastic landscape alteration, displacement of wildlife and soil erosion resulting in offsite sedimentation. In North Carolina mining, the potential adverse effect of the most widespread concern is offsite sedimentation of inorganic solids. The primary objective of the mining program in the State is to assure the reclamation of areas disturbed by mining within two years after the completion of mining. Best management practices for mining include use of vegetation, diversions, erosion control on haul roads, erosion control on spoil piles and tailings, buffer strips, seasonal restrictions, erosion control at abandoned mine sites, and silt fences. INTERACTIVE POLLUTANTS AND JOINT ABATEMENT COSTS: ACHIEVING WATER QUALITY STANDARDS WITH EFFLUENT CHARGES,
Newcastle-upon-Tyne Univ. (England). Dept. of Economics.
B. Beavis, and M. Walker.
Journal of Environmental Economics and Management, Vol 6, No 4, p 275-286, December 1979. 2 Fig, 13 Ref.

Descriptors: *Water pollution control, *Interactive pollutants, *Joint abatement costs, *Water quality, *Effluent charges, *Analysis, *Water quality control, Abatement, Pricing policy, Taxes, Pollution abatement, Model studies, Hydrologic models, Control, Water pollution abatement.

The authors study water pollution control by considering simultaneously spatial considerations, interactive pollutants, and joint abatement costs. Analysis is confined to pollutants which exert either an acute toxicity effect or a dissolved oxygen demand or both. Two forms of environmental constraint are specified. One, designed to deal with non-interacting pollutants, places upper bounds on the allowable levels of concentrations of certain pollutants in a given stretch of the water course. The second set of constraints is designed to handle explicitly the case of interactive pollutants. Satisfactory resolution of water pollution control problems requires that discharges of pollutants at any point in the water course be related to ambient concentrations of toxicity and dissolved oxygen in each stretch of the water course. Hydrological modeling techniques have demonstrated the possibility of making predictions of this kind. The analysis in this paper raises serious doubts about the practicability of an iterative pricing policy taking place in real time for determining the appropriate tax to be levied on polluting discharges in order to achieve specified levels of water quality. Descriptors: *Management information systems, *Data storage and retrieval, *Information retrieval, *Ponds, *Lakes, Electronic data processing, Automatic data processing, Water management(Administrative), Water management(Applied), Water resources planning, Computer programs.

The present study deals with the design of a state-of-the-art information system for managing ponds and lakes resources at the state level. Accomplishing this goal for Massachusetts entailed the completion of 4 separate tasks: (1) To assess the quality and quantity of ponds and lakes information existing in Massachusetts. (2) To survey the 'state of the art' of computerized management information systems including water resources information systems. (3) To evaluate the implications for Massachusetts state agencies of computerizing in a single system all the ponds and lakes information they already possess. (These implications involved the assessment of how the agencies' current ponds and lakes management decisions depended on ponds and lakes data, and how these decisions--and the data they depend on--could be expected to change in response to federal programs.) (4) To design a management information system for Massachusetts ponds and lakes information. This design included the creation of a complex data base structure which was suited to existing computer software packages, and the development of a functioning pilot demonstration system based on state agency data for 20 lakes and ponds. To our knowledge the Massachusetts Ponds and Lakes Information System (PALIS) is the first comprehensive statewide computerized information system for the management of ponds and lakes resources. The need it is designed to fill in Massachusetts exists in other states as well, and both the PALIS design process and the PALIS system are readily transferable to other states seeking to improve the management of their ponds and lakes resources.

GROUNDWATER BASIN MODELING USING THE FINITE ELEMENT METHOD - YOLO COUNTY CASE STUDY,
California Univ., Davis, Dept. of Agricultural Economics.
O. A. Bamgboye.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-157 324, Price codes: A07 in paper copy, A01 in microfiche. MS Thesis, 1979, 126 p, 20 Fig, 6 Tab, 2 Append. (California Water Resources Center Project UCAL-WRC-W-526). OWRT-B-187-CAL(1).

Descriptors: *Groundwater, *Water management(Applied), *Finite element analysis, Analytical techniques, Algorithm, California, Aquifer management, Model studies, *Yolo County(Calif).

In order to effectively monitor and manage aquifers subjected to varying natural and artificial recharge as well as increased pumping demands, it becomes necessary to analyze their hydrodynamic response. In this study a regional two-dimensional flow analysis is formulated using finite element techniques. A general algorithm is described to handle confined or unconfined flow. The advantage of using finite element analysis for aquifer flows becomes evident when attempting to model irregular boundaries and variable inputs such as natural recharge, pumping and aquifer properties. Numerical solutions are presented which, when compared with known analytical results, verified the technique and showed some limitations of the model. An analysis is presented of flow in the aquifer systems underlying Yolo County, a region where time variable pumping and natural recharge do occur. Unconfined and confined groundwater flow analysis were employed to simulate the hydrodynamic response of the Yolo County aquifer systems. The Galerkin time step scheme formulation was found applicable for small time steps. Based on minimization of differences between recorded and computed groundwater levels, the confined analysis using reliable constant transmissivity values is regarded as the most appropriate model for the aquifer systems. OPTIMAL ALLOCATION OF WATER RESOURCES IN AN INPUT-OUTPUT FRAMEWORK: USER'S MANUAL,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
T. Jonch-Clausen, and H. J. Morel-Seytoux.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-158264, Price codes: A12 in paper copy, A01 in microfiche. Interim Report for FY 1977-1978, Report No CER 77-78TJ - HJM 23. March 1978, 259 p, 22 Fig, 17 Tab, 24 Ref, 3 Append. OWRT B-115-COLO (5).

Descriptors: *Water allocation(Policy), *Planning, *Input-output analysis, *Computer models, Mathematical models, Hydrology, Water resources, Water policy, Cost analysis, Colorado, Computer programs, Simulation analysis, Water demand, Water supply, Optimization.

Planner oriented instructions are given for the use of a methodology for the optimal allocation of water resources in a region. The methodology uses a piecewise quadratic programming approach in an input-output framework to model the highly interdependent hydrologic processes governing the distribution and movement of water in natural systems. The methodology is general and applicable to a variety of situations so that the planner can formulate his particular problem. The model is designed to integrate the input-output description of a regional water resource system with the appropriate optimization approach and can handle a variety of cases such as: (1) single or multiperiod allocations, (2) minimization of expected or uncertain costs, and (3) power costs functions or simple linear or quadratic cost functions. A flow chart of the model describes the steps to be taken by the user as well as the model operations. A highly simplified conceptualization of the Cache la Poudre River basin in northern Colorado is used to illustrate the mathematical formulation of a planning problem and the computerized solution of the problem. The characteristics of the water resources of this basin are described along with sample inputs and outputs. Program listing for a single-period and a dual-period allocation model are given along with program flow charts for the FORTRAN IV Program. (Seigler-IPA)

A STOCHASTIC DESCRIPTION OF WET AND DRY SPELLS IN TERMS OF AN EFFECTIVE NUMBER OF DAYS,
Royal Netherlands Meteorological Inst., De Bilt.
H. A. R. De Bruin.
Journal of Hydrology, Vol 45, No 1/2, p 91-99, January 1980. 2 Fig, 2 Tab, 3 Ref, 1 Append.

Descriptors: *Stochastic processes, *Persistence, *Rainfall, Hydrologic data, Hydrology, Rain, Climatology, Meteorology, Synthesis, Frequency, Distribution patterns, *Stochastic description, *Hydrological studies, Climatological studies, Meteorological forecasting, Wet days, Dry days, Random variables.

The influence of persistence on the length of dry and wet spells is shown. A sequence of wet and dry days was treated as a binary process with the value 1 if a day was wet and a value of 0 if a day was dry. A day was called dry when the rainfall amounted to less than 0.25 mm. Other days were called wet. It was shown empirically that for the description of this influence an effective number of days can be used, similar to that of a previous study of Chapman and Bartels, which accounts for the effect of persistence on the variance of mean values. An empirical autocorrelation function was used to reduce the number of parameters. In this form the proposed model contained two parameters. These were the overall probability that a day is dry or wet and a parameter that accounts for persistence. In an appendix an infinite sequence of wet and dry days was considered, on the condition that the mean length of wet and dry runs was infinite. (Roberts-ISWS)

INCORPORATION OF PERCEPTUAL STANDARDS INTO A WATER QUALITY INFORMATION SYSTEM,
Auburn Univ., AL. Dept. of Accounting and Finance.
S. H. Dinius.
In: Proceedings of Third World Congress on Water Resources, Mexico City, Mexico, April 1979. Vol 4, p 1745-1954, 1979. International Water Resources Association, Mexico City. OWRT A-054-ALA(1).

Descriptors: *Pollution, Statistical analysis, Visual pollution, *Water quality, *Water quality index, Water pollution index, Litter pollution, Water quality control, *Visual performance test, Water quality system.

Laymen's perceptual evaluation of varying levels of pollution was measured utilizing a specially designed visual performance test. The test contained water site photographs in which pollution levels were systematically varied. Statistical analysis using analysis of variance and Duncan's Multiple Range Test indicated that subjects evaluation of each water site's level of pollution varied significantly with the quantity of artificial pollution placed there by investigator. Factor analysis isolated three determinants related to human perception of water site quality. One factor was incorporated into a previously designed water quality system which originally linked together chemical analysis of 11 important water pollutants with detrimental effects of the pollutants. The result is one unified water quality system in which water scientists evaluate polluting effects of chemically analyzable pollutants, and laymen evaluate elements related to human value such as obvious pollution.

SIMULATED CHANGES IN GROUND-WATER LEVELS AND STREAMFLOW RESULTING FROM FUTURE DEVELOPMENT (1970 TO 2020) IN THE PLATTE RIVER BASIN, NEBRASKA,
Geological Survey, Lincoln, NE. Water Resources Div.
E. G. Lappala, P. A. Emery, and F. J. Otradovsky.
Geological Survey Water-Resources Investigations 79-26 (open-file report), 1979. 82 p, 36 Fig, 11 Tab, 16 Ref.

Descriptors: *Groundwater mining, *Model studies, *Water resources development, *Projections, *Water levels, *Streamflow, Nebraska, Aquifer characteristics, Evapotranspiration, Aquifer systems, Pumping, Water wells, Drawdown, Groundwater recharge, Specific yield, Groundwater availability, Water utilization, Surface-groundwater relationships, Geomorphology, Irrigation, Evaluation, *Platte River basin(Nebr), *The Stream-Aquifer Hydrology Task Force.

Future changes in ground-water levels and streamflow caused by a limited set of water-resources development conditions were simulated with digital models of stream-aquifer systems within the Platte River basin, Nebraska. Simulated water-resources use in the basin included private development of ground water for irrigation, and development of ground water to supply municipal demands of Lincoln and Omaha. Simulated future conditions indicate that significant permanent declines in ground-water levels and streamflows may occur as a result of private development of ground water for irrigation. The largest simulated declines in ground-water levels were more than 80 feet by the year 2020 in upland areas in the Elkhorn and Middle Platte subbasins under conditions of rapid development of all irrigable lands. Simulated depletion of perennial streamflows by ground-water withdrawals indicated that future surface-water supplies may be limited in parts of the basin. Simulated depletions to major streams exceeded 60 percent of average perennial flow in the Elkhorn subbasin under conditions of rapid private development of ground water for irrigation. Simulations that evaluated the effects of combined private ground-water development with proposed Federal development of surface water for irrigation showed that in the project areas, ground-water level declines were reduced compared to 'without project' conditions. In some project areas, simulated ground-water level rises would lead to waterlogged conditions in parts of the Middle Platte subbasin. (Kosco-USGS)

CONSTRUCTION AND APPLICATION OF A WATER QUALITY MODEL FOR THE UPPER BLACKFOOT RIVER BASIN IN THE CARIBOU NATIONAL FOREST, IDAHO,
Idaho Univ., Moscow.
H. Singh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-161268, Price codes: A12 in paper copy, A01 in microfiche. Doctoral Dissertation, November 1979. 252 p, 28 Fig, 19 Tab, 59 Ref, 5 Append. OWRT C-7651 (No 7253)(2).

Descriptors: *Idaho, *Mathematical models, *Mining, *Fertilizers, *Phosphates, Watershed(Basins), Water pollution, Hydrologic data, Model studies, Water quality, Inflow, Discharge(Water), Environmental effects, Blackfoot River.

A steady state, deterministic and one-dimensional water quality model was developed as a management tool for future phosphate mining and processing operations in the Upper Blackfoot River basin. As the demand for phosphate continues to increase and old currently mined areas are depleted it is anticipated that phosphate mining operations in the Upper Blackfoot River basin will increase. Careful management of these mining operations will be needed to minimize or avoid the expected deterioration of water quality in streams of the area. The Boise River water quality model was modified to make it suitable for the Blackfoot River. The model, which is based on the concept of Continuously Stirred Tank Reactor, requires that the river be segmented while the steady-state inputs for atmospheric, hydrologic, and water quality simplify calculations and reduce computational time. The model was calibrated and verified using meteorological, hydrologic and water quality data from two periods in 1976. Given the limitations of the observed data and the complexity of the ecosystem involved, the model was found to be satisfactory. Using hypothetical arbitrary waste discharges at selected points in the basin the model was used to simulate the effect on stream water quality. For greater model accuracy improvements in the data collection system in the basin are needed such as: (1) coordination of various agency data collection programs, (2) additional hydrologic and water quality data collection on ungaged streams, and (3) collection of essential weather data. A QUANTITATIVE ANALYSIS OF STREAMFLOW: THE IMPORTANCE OF PRECIPITATION AND GEOMORPHIC FACTORS IN DETERMINING YIELDS FROM SMALL WATERSHEDS,
Idaho Univ., Moscow. Coll. of Letters and Science.
J. J. Kuska.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-160609, Price codes: A03 in paper copy, A01 in microfiche. Idaho Water Resources Research Institute, University of Idaho Technical Completion Report, February 1980. 27 p, 7 Fig, 8 Tab, 11 Ref. OWRT A-062-IDA(1), 14-34-0001-8014.

Descriptors: *Streamflow forecasting, *Small watersheds, *Idaho, *Rocky Mountains(Idaho), *Regression analysis, Precipitation(Atmospheric), Flow characteristics, Runoff, Channel morphology, Topography, Vegetation, Land use, Watersheds(Basins), Water resources development, Northern Idaho, Meadow Creek basin(Idaho).

Stream flow data from 12 drainage basins located in the rocky mountains in Northern Idaho that covered 12.43 square miles were statistically analyzed and related to factors such as basin length, basin area, square miles, relief ratio, and precipitation levels. The resulting linear regression (R-square value of .87) indicates that geomorphic factors as well as precipitation play a dominant role in explaining variations in streamflow. The regression model was then applied to the much larger Meadow Creek watershed (approximately 243 square miles). The Thiessen method, which assumes linear variation of precipitation between stations and assigns each segment of area to the nearest station, was used to determine precipitation values for the Meadow Creek basin. The regression model, on a number of occasions produced a prediction that was similar to actual yield from the larger basin. (Gladwell-Idaho)

A CHANCE-CONSTRAINED GOAL PROGRAMMING MODEL TO EVALUATE RESPONSE RESOURCES FOR MARINE POLLUTION DISASTERS,
Texas Univ. at Austin. Center for Cybernetic Stud-

ies.
A. Charnes, W. W. Cooper, K. R. Karwan, and W. A. Wallace.
Journal of Environmental Economics and Management, Vol 6, No 3, p 244-274, September, 1979. 4 Fig, 5 Tab, 23 Ref, 1 Append.

Descriptors: *Water pollution, *Mathematical models, *Risks, *Oil spills, *Disasters, Economics, Coasts, Planning, Management, Evaluation, Equipment, Budgets, Waste water(Pollution), Decision making, Probability, Computer programs, Equations, Coast Guard regulations, Dynamic programming.

A model is described for budgetary planning for marine pollution disasters, specifically oil spills; how the model evaluates these risks and their associated performance quality levels is also shown. This model aids Coast Guard managers in formulating policies concerning equipment required to contain major pollution incidents. The combined chance constrained-goal programming model is called Spill Incident Model (SIM). Oil spillage is defined in terms of response stages: pumping (off-loading), containment and removal. The paper describes several model details including (1) accounting constraints which enumerate the oil spill in storage and oil spilled, spilled oil that is contained, oil off-loaded from storage, and oil removed; (2) constraints that relate to equipment deployed to oil contained, removed and unloaded; (3) limitational constraints on available resources for various time periods; (4) probablistic constraints to equipment needs; and (5) goal constraints. Goal programming allows plans to come as close as possible to desired quality and risk levels for each pertinent region and incident type. Coast Guard equipment for marine pollution disasters include skimmers, containment booms, a self-contained high-speed pumping system called ADAPTS and various chemical dispersants. OPTIMAL WATER USE AND SALINITY CONTROL FOR ENERGY--UPPER COLORADO RIVER BASIN,
Arizona Univ., Tuscon. Dept. of Soils, Water and Engineering.
M. Flug, W. R. Walker, and G. V. Skogerboe.
Water Resources Bulletin, Vol 15, No 4, p 964-973, August 1979. 5 Fig, 9 Ref. OWRT C-6076 (No 5211)(3).

Descriptors: *Water management(Applied), *Optimization, *Mathematical models, *Water resources, *Energy development, *Upper Colorado River, *Colorado, Salinity, Oil shale, Coal, Modelling, Management, Linear programming, Water utilization, Efficiencies, Water demand.

The Upper Colorado River Basin contains significant amounts of undeveloped fuel resources. Development of these resources requires an adequate water supply. Present water quality is at a concentration where increased salinity would result in economic detriment to holders of downstream water rights. A mathematical model has been developed to assess the relationships between water availability in the Basin, salinity, energy production, and the economics of development. Alternative scenarios regarding synthetic fuel production are evaluated in terms of differential energy development costs, various institutional constraints, and restrictions pertaining to water use and water quality distribution. Water-related data include the quantity of water available, the average salinity, and the contribution of precipitation to the river system. Water quality control involves managing salinity impacts upon the remaining flows of the Colorado River. Actual salinity impacts resulting from energy developments can be broken down into three primary sources: water consumption, return flows, and disturbed land areas. The structure of the energy-water-salinity problem formulation is represented by a set of linear equations and inequalities which can be solved by linear programming techniques. The salt and water exchanges in mining, processing, and spent fuel disposal processes have been incorporated as part of a two-level minimum cost linear programming algorithm. The simulation provides an optimal use of Upper Colorado River water for levels of energy output such that salinity concentrations are maintained below predetermined levels. (Iervolino-NC)

BENEFITS OF LONG-RANGE STREAMFLOW PREDICTION,
California Univ., Los Angeles. Dept. of Systems Engineering.
W. W-G. Yeh, L. Becker, M. J. Cohn, and R. Zettlemoyer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-156276, Price codes: A31 in paper copy, A01 in microfiche. California Water Resources Center, University of California, Davis Technical Completion Report, Contribution 181, February 1980, 31 p, 11 Fig, 9 Tab, 2 Append. (California Water Resources Center Project UCAL-WRC-W-535).

Descriptors: *Streamflow forecasting, *Multiple-purpose reservoirs, *Surface water, *Groundwater, Streamflow, Reservoirs, Water supply, Water storage, Available water, Projections, California.

This study supplements Department of Water Resources Projects Hydrospect and Hydrospect II by assessing improved benefits that might be gained from the use of long-range streamflow forecasts in the operation of a typical multipurpose reservoir. Long-range is defined as a period of time ranging from one month to one year. The Oroville-Thermalito reservoir system is selected for study; major benefits to be derived from long-term streamflow prediction for this system are hydropower generation; water conservation for irrigation and/or other beneficial uses; and decreased seepage damage to crops. Flood control benefits are potentially high but those benefits are more amenable to short-term rather than long-term forecasting. Incremental benefits are determined as functions of forecast time and accuracy on the basis of general adherence to current operating rules. The reservoir is theoretically operated over the 1914-73 time period; forecasts and comparisons are based on the historical streamflows. Procedure failure is defined as inability to meet a minimum storage constraint at any time over the 60 year period. To provide an additional evaluation of benefits from forecasting, analyses are also made using the historical means as estimates of future streamflows. This study also explores, quantitatively, the economic benefits from optimal operation of the surface water/groundwater system, given advance estimates of future surface water supplies. (Snyder-California)

PARTICIPATION IN WATER RESOURCES PLANNING: LEADER AND NON-LEADER COMPARISONS,
Purdue Univ., IN. Dept. of Sociology and Anthropology.
H. R. Potter, G. M. Grossman, and A. K. Taylor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-156128, Price codes: A03 in paper copy, A01 in microfiche. Purdue University Water Resources Research Center Technical Report No 107, 1980. 33 p, 13 Tab, 27 Ref. OWRT A-053-IND(1).

Descriptors: Social participation, Economic models, *Water resources, *Political aspects, *Social aspects, Environment, Model studies, Community leaders, *Public participation, Non-leaders, *Environmental problems.

The purposes of this research are to provide descriptive comparisons of community leaders and the general public on (1) how they perceive environmental problems, (2) how they view opportunities for citizen participation, (3) the extent to which they participate in decision making, and (4) to compare alternative models of community decision making. Data are from personal interviews with 46 leaders and a sample of 139 residents of Tippecanoe County, Indiana. The differences between leaders and the public were not generally great in how they see environmental problems, however, leaders who see problems are more concerned, although they are more likely to think pollution will improve in the near future. The public is more likely to think not enough is being done. Both groups support citizen participation, however leaders participate much more than the public. Nevertheless, both evaluate the effectiveness of techniques for political participation similarly. Two models of community decision making, knowledge-participation and socio-economic models, produce similar, mixed results in explaining environmental attitude. A model that combines the variables of both of these models does somewhat better, but still varies depending on the indicator of the dependent variable. Political participation, leadership and education each have independent effects in the regression model where R is statistically significant. Greater participation and more education leads to perceiving more environmental problems, while leaders perceive fewer problems. Problems of measuring environmental attitude are discussed.

PUBLIC PARTICIPATION IN THE NORTH CAROLINA STATEWIDE 208 WATER QUALITY PLANNING PROGRAM: AN EVALUATION OF THE PROBLEM IDENTIFICATION PHASE OF PLANNING,
North Carolina Univ. at Chapel Hill. Dept. of City and Regional Planning.
B. Stiftel, S. Herzberg, and D. R. Godschalk.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-157597, Price codes: A08 in paper copy, A01 in microfiche. Water Resources Research Institute, University of North Carolina. Working Paper No 75, June 1979. 146 p, 57 Fig. OWRT-A-096-NC(2), 14-34-0001-8035.

Descriptors: *Water quality control, *Planning, Costs, Evaluation, Programs, Public participation, *North Carolina, *Water quality planning program.

The Problem Identification phase of an analysis of the public participation effort of the North Carolina statewide '208' water quality planning program is presented. The analysis was based on 7 criteria: accessibility, involvement, public awareness, staff awareness, effect on staff and plan, effect on public and plan, and cost. The major results indicate that the public participation program was successful from the viewpoint of both planners and participants. Findings with respect to 10 participation methods, including circulation reports, meetings, goal setting workshops and advisory committees, are presented.

THE PYRAMID LAKE-NEWLANDS PROJECT CONTROVERSY, 1903-1926,
Nevada Historical Society, Reno.
J. M. Townley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-157928, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Center, University of Nevada System, Reno. Completion Report, February 1980, 9 p. OWRT A-074-NEV(1), 14-31-0001-7060.

Descriptors: *Nevada, *Irrigation programs, *Federal project policy, *Water policy, Land reclamation, History, Indian reservations, Land use, Water storage, Water supply, Water users, Water demand, Lake Tahoe, Pyramid Lake, Carson River, Truckee River.

Historical records were used to study the Newlands Project, Nevada's initial Federal reclamation project, during the period 1903 through 1926. Since 1903 there has been controversy over the allotment of Truckee River water among users. In 1923 the Bureau of Reclamation turned over operational control of the project to the locally directed Truckee-Carson Irrigation District. Early U.S. Department of Interior actions to supply water to the Newlands Project and the effect on Pyramid Lake, now the Pyramid Lake Paiute Reservation,

were studied. Records from newspapers, archival collections, and various Federal agencies were used to investigate the problems encountered in construction of the Truckee-Carson Project, the struggle for control of Lake Tahoe as a storage reservoir, and the treatment of the Paiute as a homesteader on the project. From this historical study three publications were prepared that will probably be consulted when the litigation concerning the Truckee-Carson Irrigation District, the Pyramid Lake Pauite Reservation, and the water users of the Truckee and Carson Rivers is examined in Federal court. The study shows that original estimates of potentially reclaimable acreage were high and the actual 60,000 acres reclaimed are not enough to economically justify the creation of the project. Failure to purchase control of the Tahoe City dam forced up land prices in the reclamation district from $22/acre to over $100/acre. The Paiute Indians lost approximately 30,000 acres, were excluded from entry within the project, and were isolated on a reservation with no consideration of Winters Doctrine rights. (Seigler-IPA)

UNDEVELOPED HYDROPOWER AS A POTENTIAL ENERGY SOURCE IN IDAHO,
Idaho Univ., Moscow. Water Resources Research Inst.
C. C. Warnick, and L. F. Heitz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-157399, Price codes: A03 in paper copy, A01 in microfiche. Research Technical Completion Report, November 1979. 24 p, 3 Fig, 5 Tab, 10 Ref. OWRT A-057-IDA(2).

Descriptors: *Idaho, *Pacific Northwest U.S., *Hydroelectric plants, *Electric powerplants, Hydroelectric power, Energy conversion, Flow duration, Flow measurement, Flow rates, Water resources, Hydrology, Regression analysis, Washington, Oregon, Montana, Wyoming, Nevada.

The potential energy available in both regulated and unregulated streams in Idaho and the Pacific Northwest through the use of small scale hydro development was surveyed. Increasing energy demands, the rising cost of fuels for steam power plants, and recent advance in the production of smaller units have combined to make the construction of small scale, low-head hydro developments a viable source of energy. For the survey a technique was developed to find flow duration information along reaches of streams that did not have flow records due to inadequate gaging. Also a method for estimating flow duration curves for regulated streams was developed and applied. To determine head for power computations the difference in elevation at the inflow and outflow points of a reach was used. Results showed that most plants would be of the run-of-river type installation. Synthetic flow duration curves were based on a technique of regression equation between flow of a given interval and the average annual flow. Parametric curves resulted from the unregulated stream flow duration curves. A preliminary social, political, and environmental feasibility evaluation was also made for each reach with theoretical energy potential. Summaries of the survey results are included. Data from the Idaho survey were catalogued and computerized for easy retrieval and processing. Considerable theoretical potential was found for small hydro in the state of Idaho. (Seigler-IPA)
W80-03918

AN ECONOMIC EVALUATION OF THE SALINITY IMPACTS FROM ENERGY DEVELOPMENT: THE CASE OF THE UPPER COLORADO RIVER BASIN,
Utah Water Research Lab., Logan.
R. Narayanan, S. Padungchai, and A. B. Bishop.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-159932, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Planning Series UWRL/P-79/07, December 1979. 71 p, 20 Fig, 45 Tab, 2 Append. OWRT-B-141-UTAH(1), 14-34-0001-7192.

Descriptors: *Energy development, Water resources, *Salinity, *Mathematical models, *Economic feasibility, Cost-benefit analysis, Water allocation(Policy), Water quality, *Salinity reduction, Colorado River Basin, Upper Colorado River Basin.

To analyze the effect of potential energy development on water allocation and water quality in the Upper Colorado River Basin, a linear programming model is formulated. Using the model, changes in salinity are predicted. Further, least-cost strategies to maintain the established numeric salinity criteria through both structural and non-structural alternatives are developed. The effectiveness of alternative control measures are examined within given institutional constraints. Based on cost-benefit analysis, optimal salinity levels over time are proposed. The economic feasibility of presently planned structural measures to reduce salinity is investigated and contrasted with non-structural alternatives.

THE OPTIMAL MANAGEMENT OF TRANSBOUNDARY RENEWABLE RESOURCES,
British Columbia Univ., Vancouver.
G. R. Munro.
The Canadian Journal of Economics, Vol 12, No 3, p 355-376, August 1979. 2 Fig, 20 Ref.

Descriptors: *International waters, *Fisheries, *Mathematical models, *Fish management, *Boundary disputes, *Adjacent land owners, International law, Legal aspects, Foreign trade, Foreign waters, Economics, International Joint Commission, Joint costs, Optimization, Model studies, Payment, Royalties, Commercial fishing, Economics, Water law, Boundaries(Property), Fish harvest.

Optimal management of renewable resources such as a fishery is extended from an assumption of ownership and control by a single state to ownership by two adjoining political jurisdictions. Resource management conflicts are easier to resolve if one co-owner can make side payments to the other to balance interest. A dynamic model of fisheries is combined with Nash's theory of two-person co-operative games. Conflict in management strategies between the co-owners is viewed in terms of varying propensity of each state to invest or disinvest in the resource. Conflicting views on optimal stock or biomass on the part of each state implies disagreement over optimal harvest rates. Three kinds of management conflicts are considered: (1) differences in perceived social rates of discount, (2) different harvesting costs, and (3) varying consumer preferences. Additional research in regard to multinational resource ownership should be obtained for fishery resources off West Africa in the Atlantic or the tuna fishery in the Pacific. In addition, policy consequences of allowing parameters to fluctuate through time should be examined. Further, implications should be investigated of joint management programs of limited resource. Finally, numerous actual cases of jointly owned renewable resources are being created through the emerging system of 200-mile exclusive economic zones in coastal waters. (Harris-Wisconsin)

Comparison of results of attitudinal and opinion surveys conducted in Japan and the United States show that perceptions about the environment vary according to prevailing national culture. In 1974 interviewing, a Japanese team polled a nationwide random sample; US polling was limited to samples in heavily industrial Erie County and environmentally unspoiled Hamilton County, both in New York. More than twice as many Japanese as Americans rank the environment as the first or second most important national problem. Several components widely perceived by Americans as part of the environmental problem (such as population growth, energy availability, urban blight) are considered irrelevant by Japanese. Thus Japanese define the environmental problem narrowly as pollution alone, while Americans give it a broader definition. Japanese are more likely to blame the government for pursuing a wrong policy (unlimited industrial expansion) in assigning causes for environmental problems; Americans are inclined to blame people such as themselves for personal carelessness in causing these problems. Expectedly, Japanese are also more likely to want the national government to solve the environmental problem; Americans prefer a greater degree of individual initiative. Americans are also much more likely than Japanese to take part in environmental cleanup campaigns and similar mass activities. It concludes that people who live in environmentally damaged cities of Japan are more likely than American to perceive environmental problems as serious and are more willing to accept strong governmental action to correct it. THE COSTS AND BENEFITS OF WATER METERING,
International Bank for Reconstruction and Development, Washington, DC. Energy Water and Telecommunications Dept.
R. N. Middleton, R. J. Saunders, and J. J. Warford.
Journal of the Institution of Water Engineers and Scientists, Vol 32, No 2, p 111-122, March 1978. 3 Fig, 9 Ref, 2 Append.

Descriptors: *Cost-benefit analysis, *Instrumentation, *Domestic water, *Water consumption(Except consumptive use), Cost-benefit theory, Feasibility, Water conservation, Use rates, Water rates, Water utilization, Potable water, Cost analysis, Cost allocation, Tariff, Prices, Economics, Consumptive use, Asia, Developing countries, Costs, Water allocation(Policy).

The decision of whether or not to meter individual households, examined in this study in terms of its theoretical framework and exemplified with water management experiences from several Asian cities, is subject to cost-benefit analysis. Quantifiable benefits developed through water metering are reduced operating and maintenance costs of the existing water supply and wastewater disposal facilities; these benefits are realized through reduction of water usage in the metered households. Other metering benefits are more difficult to quantify; they include: (1) more equitable allocation of costs to users, (2) general water conservation, and (3) better-identified demand trends in metered geographic areas. Costs include those to suppliers (Meter purchase and installation, setting up repair and storage facilities, meter inventories and replacement) and those borne directly by consumers (reductions in wasteful water uses and general water consumption). Because little data is available on the relationship between consumption and price it is difficult to estimate the value of various costs. Decisions on whether to adopt metering should be made in terms of the amount of reduced consumption which is sufficient to justify metering costs (assuming that reductions occur in all cases if meters are installed in households). In all but one of six Asian cities studied, water metering was cost justified. (Harris-Wisconsin)

DEMINERALIZATION OF BRACKISH MUNICIPAL WATER SUPPLIES--COMPARATIVE COSTS,
Miller and Associates, Boulder, CO.
E. F. Miller.
Journal of the American Water Works Association, Vol 69, No 7, p 348-351, July 1977. 1 Fig, 4 Tab, 31 Ref.

Descriptors: *Water treatment, *Reverse osmosis, *Electrodialysis, *Comparative costs, *Municipal water, *Demineralization, Colorado, New Mexico, Texas, Brackish water, Impaired water quality, Ion exchange, Groundwater, Economics, Water purification, Water softening, Cost analysis, Value engineering.

Comparisons between 1970-73 and 1977 cost analyses for treating brackish groundwater in 13 municipalities in Colorado, New Mexico and Texas, reveals that reverse osmosis preceded by an ion-exchange dealkylation (softening) in the case of high salinity, is the most inexpensive process for lowering brackish water mineral content. In 1970-73 treatment costs ranged 6.9-41.5 cents/cu m. For four of the 13 municipalities electrodialysis was the least costly treatment process. Reverse osmosis was most cost-effective for four other municipalities. For the remaining five municipalities, the least costly process was either exchange softening and either electrodialysis of reverse osmosis in combination. Cost projections for 1977 ranged 9.8-51.5 cents/cu m. These are incremental costs above costs incurred for pumping, removing iron, softening and sterilizing groundwater supplies to these communities. Technological improvements and the increased cost of energy are the main reasons reverse osmosis has become the least-cost process. Reoptimization of reverse osmosis system designs to employ looser membranes is warranted because of rising energy costs. No such opportunities can be seen for lowering energy requirements for electrodialysis, and the competitive standing of such systems is now limited. (Harris-Wisconsin)

Data are of value in the design and operation of water resource projects because they provide information about uncertain states of nature. This information can in turn be used to reduce the risks inherent in the project. In this paper, risk calculations from the preposterior analysis of statistical decision theory were extended to cover nonoptimal decisions. Risk was measured in terms of the project objectives by embedding the data network into an information-response (IR) system. The value of addition or improvement to the data base was measured by the change in the risk. Measures of the performance of the IR system were developed. From these measures, the efficiency of the information subsystem, the response subsystem, and the overall IR system were defined. These concepts are illustrated by a simple example in which the additional data sample for estimating the 6 1/4-year flow was shown to have different values (negative in one case), depending on the estimation method or decision rule used. Five anomalies and paradoxes in the literature concerning the worth of data were explained. Within the framework of the information-response model and its measures of performance and efficiency, additional data always improve information efficiency but may increase or decrease response efficiency. The relative increase or decrease of these efficiencies determines the worth of additional data for nonoptimal decision making. (Humphreys-ISWS)

TERMINATION OF HYDROLOGIC DATA COLLECTION (A CASE STUDY),
Science and Education Administration, Tucson, AZ. Southwest Rangeland Watershed Research Center.
L. J. Lane, D. R. Davis, and S. Nnaji.
Water Resources Research, Vol 15, No 6, p 1851-1858, December 1979. 8 Fig, 3 Tab, 19 Ref.

Descriptors: *Hydrologic data, *Demonstration watersheds, *Research priorities, *Decision making, *New Mexico, *Arizona, Value, Precipitation(Atmospheric), Runoff, Methodology, Analytical techniques, Analysis, Management, Statistical methods, Homogeneity, Sampling, Networks, Terminating data collection.

The operation of seven experimental watersheds near Albuquerque, New Mexico, and Safford, Arizona, which only obtain data on precipitation and runoff, was examined to determine (1) if their operation should continue as is, (2) if their data collection abilities should be expanded, or (3) if their operation should be discontinued. The decision-making procedure is modeled in terms of the theory of 'bounded rationality' rather than classical optimization theory. The choice of alternatives was subject to three constraints: that the resources for data collection activities at Southwest Watershed Research Center would not be increased, that it be administratively feasible, and that no research program be seriously impaired. A problem-data matrix that showed the data needs for several research objectives was constructed. Based on this matrix and an estimate of the value of the research to the agricultural community, the three alternatives for the operation of seven watersheds were evaluated. Considering the constraint of no additional resources and of administrative feasibility, the alternative of closing the seven watersheds was the best. To check that the third constraint was not violated, regional studies were made to compare precipitation and runoff characteristics of the Safford and Albuquerque watersheds with other experimental watersheds. A Bayesian decision analysis on the worth of future data was made. The regional analysis and the Bayesian study showed that closure of the watersheds would be detrimental to the precipitation and runoff data base, but not to the extent of impairing research objectives. The Albuquerque and Safford watersheds were closed in June 1976. (Humphreys-ISWS)

RECREATION AT THE MCCLELLAN-KERR ARKANSAS RIVER NAVIGATION SYSTEM,
Institute for Water Resources (Army), Fort Belvoir, VA.
L. G. Antle.
Water Resources Bulletin, Vol 15, No 5, p 1408-1417, October 1979. 1 Fig, 6 Tab, 9 Ref.

Descriptors: *Recreation, *Management, *McClellan-Kerr Navigation System, *Multiple-purpose reservoirs, *Social impact, *Arkansas River, Recreation demand, Land use, Benefits, Costs, Cost-sharing, Benefits, Costs, Regional development, Economic impact, Economics, Lakes, Employment, Income, Employment opportunities, Arkansas, Oklahoma, Water level fluctuations, Water utilization.

Analysis of recreation impacts of the McClellan-Kerr Arkansas River Navigation System during 1963-1976 show some rich benefits and substantial problems; results suggest that the share of financial resources obtained from recreational users should be increased and that management activities should be transfered from the Corps of Engineers to non-federal agencies. The physical system was designed to provide multiple purpose capability including flood control, hydroelectric power, navigation, water supply, recreation, and fish and wildlife enhancement. Project benefits include increases in employment, income, economic dvelopment and migration. Total regional employment has increased from 417,183 in 1960 to 518,464 in 1970. Aggregate recreation expenditures are estimated at $193 million in 1974 and $224 million in 1975. Social impact analysis shows that 200,000 persons were directly influenced to migrate into the area since 1970 because of job opportunities and recreation advantages. However, the same factors which contribute such dramatic beneficial impacts also lead to formidable management problems such as financing and staffing recreation programs and managing conflicts between desirable uses of multiple purpose systems. Recreation impacts place stress on Corps funds and staff, both of which are limited due to federal budget constraints. Heavily used recreational lakes are a continual source of public conflict with respect to lake levels for other uses such as holding flood flows or releases for power and water supply. The paper concludes with strategies for Corps policy. (Danovich-Wisconsin)

This article points out how the natural environment's goods and services are grossly undervalued in conventional economic accounting. Economists believe that new technology will always find substitutes for items which become scarce. This is often true for synthetic goods and services; but for land and life-support systems such as water or food no substitutes exist. Narrow economic views, that it is permissible to destroy resources such as an estuary if alternative economic activity equals or exceeds the original activity dollarwise, are challenged. The more preferable alternative is to build factories on high ground so that industry and marshes can be coupled for greater long-term economic gain. The market system fails when the monetary return on one gallon of water is much higher when used for manufacturing or mining than for agriculture or drinking. Natural life-support systems cannot be priced; people cannot live without them. Natural solar-powered ecosystems

interface with artificially fuel-powered urban-industrial systems and fuel-subsidized agricultural systems to provide a desirable synergism. Interfaced natural ecosystems can supply one-third the total energy maintaining a city in a healthy state in terms of economic and quality-of-life dimensions. Total energy flow, as opposed to net energy output, is used as a basis for calculating the value of natural ecosystems. (Danovich-Wisconsin)

ON THE COST-BENEFIT ANALYSIS OF PORT PROJECTS,
University Coll. of North Wales, Bangor.
S. R. C. Wanhill.
Maritime Policy and Management, Vol 5, No 4, p 315-326, September, 1978. 2 Fig, 7 Ref, 1 Append.

Descriptors: *Investment, *Harbors, *Economics, *Benefits, *Cost-benefit analysis, Port authorities, Shipping, Navigation, Equations, Import, Export, Costs, Elasticity of demand, Elasticity of supply, Mathematical models, Mathematics, Curves, Welfare(Economics), Theoretical analysis.

Mathematical models are presented which examine whether port investment projects reduce shipping costs and which deal with both exporter and importer cases. The theoretical background to port investment projects is outlined and compared against common practices that consider benefits of port improvements as cost savings accruing to shipowners. These savings result from reductions in congestion and turnaround time in the case of improved berthing and handling facilities and reductions in congestion and shipping costs/ton cargo when channel deepening takes place, permitting larger vessel use. When calculating welfare changes, the major constraints are time and data availability. The problem involves estimating demand and supply functions for imported and exported goods and their associated elasticities. The crucial step relates to assumptions that export supply curves for trading nations other than the home country are horizontal. Assumption appeal and practical relevance clearly depends upon circumstances; however, this assumption is realistic in the case of small economies such as developing countries. (Danovich-Wisconsin)

Optimization techniques cannot be applied to sewerage and other forms of sanitary sewage disposal planning in developing countries. Present knowledge does not permit sewerage investment optimization. Attempts at rigorous quantification are likely to be futile, non-transferable and of questionable benefit. It is universally recognized that adequate quantities of safe water together with sewage disposal are basic necessities for good health and productivity. In 1975 only 646 million people of 33% of the total population in developing countries were adequately served by public sewers or household systems. These include only 15% rural population and 75% of the urban population. Adequate disposal facilities for human wastes are greatly significant for public health and economic development. Human excreta is the principal source of pathogenic organisms which cause many communicable diseases transmitted by water, food, and flies. The United Nations Conference on Human Settlements recommends that by 1990 all populations have community water supply and sewerage services. This target requires the following: Sewage disposal and water supply should be recognized as a basic infrastructural element and less as social services. Greater emphasis must be placed on serving needs of the rural poor. Since sewage disposal investment is greater than developing countries' resources, much greater external assistance is needed. Donor countries and international agencies should allow much greater flexibility in loan criteria by including prevailing economic and social conditions. (Danovich-Wisconsin)

BIOECONOMIC MODEL OF THE GULF OF CARPENTARIA PRAWN FISHERY,
British Columbia Univ., Vancouver. Dept. of Mathematics.
C. W. Clark, and G. P. Kirkwood.
Journal of Fisheries Research Board of Canada, Vol 36, No 11, p 1304-1312, 1979. 3 Fig, 3 Tab, 3 Ref.

Descriptors: *Fisheries, *Fish management, *Gulf of Carpentaria, Australia, *Mathematical models, *Shrimp, Commercial fishing, Australia, Model studies, Optimization, Economics, Competition, Long-term planning, Optimum development plans, Shellfish, Commercial shellfish, Fish harvest, Fishing gear.

The study presents a bioeconomic model pertaining to a recently developed prawn fishery in the Gulf of Carpentaria and adjacent waters in Northern Australia. However, the constant annual recruitment rate on which optimal long-term fleet size is based, is unrealistic. Additional biological studies concerning recruitment rates and more detailed economic surveys are needed to alleviate some of the shortcomings of the present model. The model employs 21 parameters to describe performance of two classes of vessels (brine and freezer trawlers) exploiting several stocks of prawns. The number of each vessel class entering the fishery under free access is predicted. When predictions are compared to the real situation, neither vessel type described by the model is optimal, but less expensive, smaller freezer trawlers are more appropriate. Thus many brine vessels are currently being fitted with freezing facilities, while newly constructed freezer trawlers have smaller dimensions than previous ones. Linearity of the model, which concludes that optimal allocation requires the entire fleet to be allocated to one stock at one time, is contradicted by data from the real situation. Due to such factors as crowding and interference, saturation of unloading facilities, and competition for prawn catch by individual vessels, the fleet is spread over the stocks. (Harris-Wisconsin)

DYNAMIC WATER MANAGEMENT: AN OPTIMAL CONTROL APPROACH,
California Univ., Davis. Dept. of Agricultural Economics.
J. E. Noel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-157084, Price codes: A11 in paper copy, A01 in microfiche. PhD Dissertation, January 1979, 212 p, 11 Fig, 28 Tab, 7 Appen. (California Water Resources Center Project UCAL-WRC-W-526). OWRT-B-187-CAL(2).

Descriptors: *Water management(Applied), *Computer models, *Linear programming, Economics, Optimization, California, Water supply, Water demand, Evaluation.

A dynamic water management model is used to determine the socially efficient allocation of the region's ground and surface water resources. The allocation problem is divided into three major areas: (1) spatial allocations, (2) intertemporal allocations and (3) conjunctive use allocations. The management model uses the present value of current use and present value of storage to simultaneously determine all three allocation problems. A linear programming model is formulated to provide shortrun impact analysis of the agricultural sector and to provide derived demands for agricultural water and a linear quadratic control model is used for determining the socially optimum spatial and intertemporal allocations of water over a thirty-year planning horizon. The two models interact with each other in an iterative procedure permitting overall optimization of the economic and hydrologic system. The dynamic water management model is used to analyze the impact of four different energy cost senarios on the socially optimal allocation of ground and surface water and to empirically evaluate the economic validity of taxation and pro-rata quota policies for achieving a socially optimum allocation of groundwater. Descriptors: *Water supply, *Density, *Water utilization, *Economies of scale, *Cost analysis, Water costs, Costs, Statistics, Water consumption(Except consumptive use), Utilities, Equations, Production, Distribution, Regression analysis, Water rates, Unit costs, Water demand, Water delivery.

Only scale and per-capita use significantly affect water system costs, while consumer density has little effect. Water consumers benefit from being served by large systems and being located in service areas characterized by relatively high per capita usage. Analysis provides little evidence that more dense areas have lower water service costs than less dense areas. However, the results might have been different if cost data could have been disaggregated into production and distribution components. Water service cost analyses are hindered by the lack of homogeneity across firms within the water utility industry. Relatively low coefficients of determination for equations reflect some analysis limitations. Cost variables suffer from a lack of disaggregation. Several nonquantifiable variables, such as differences in regulation, create cost differences not reflected by traditional variables. Differences in accounting procedures, financial environment, climate, terrain and hydrological conditions also affect cost differences.

Some unexplained cost variation is also attributed to internal efficiency differences across water systems. (Danovich-Wisconsin)

CAPITAL COST FUNCTIONS OF A SURFACE WATER TREATMENT PLANT AND ITS COMPONENTS,
Illinois Univ. at Urbana-Champaign. Coll. of Commerce and Business Administration.
H. Hinomoto.
Water Resources Research, Vol 13, No 6, p 873-876, December 1977. 1 Fig, 2 Tab, 8 Ref.

Descriptors: *Treatment facilities, *Capital costs, *Diseconomies of scale, Water treatment, Costs, Economics, Economies of scale, Surveys, Regression analysis, Cost analysis, Investment, Geographical regions, Sewerage, Public utilities, Waste water treatment, Water pollution control, Operating costs

Analysis of 12 water treatment plants with 1-12 mgd capacity range constructed 1965-1972 shows diseconomies of scale in capital costs. This is contrary to investment cost functions showing economies of scale in past studies on surface water plants. Beta estimated values in past studies, including Koenig, Ackermann and Orlob and Lindorfs, were 0.67 showing economies of scale. The present study has 1.166 beta value, indicating small but positive economies of scale. Cost data includes: (1) site preparation and outside work; (2) building and structure; (3) piping, valves and gates; (4) equipment; and (5) utility work. Six plants are located in North Central U.S., four in the North Atlantic region, and two in the South Atlantic region. Although study results indicate diseconomies of scale in investment cost, plant use may actually become increasingly attractive with capacity. Both investment cost and operating cost need to be determined. Long-run technological change may affect plant design or construction procedure which may change relative magnitudes of labor, material and equipment costs constituting total costs. In particular, labor-saving devices installed for plant operation may increase plant investment cost but decrease operating cost. (Danovich-Wisconsin)

WATER RATE POLICY: LESSONS FROM LESS DEVELOPED COUNTRIES,
International Bank for Reconstruction and Development, Washington, DC. Dept. of Energy, Water and Telecommunications
J. J. Warford, and D. S. Julius.
The Journal of the American Water Works Association, Vol 71, No 4, p 199-203, April, 1979. 1 Tab, 9 Ref.

Descriptors: *Water rates, *Water policy, *Developing countries, *Public utilities, *Water supply development, Urban sociology, Utilities, Water supply, Planning, Prices, Tariff, Income, Income distribution, Water demand, Long-term planning, Rates, Social aspects, Marginal costs, Economic efficiency, Economies

Technologically advanced countries can learn about water pricing from less-developed countries (LDCs) since physical and financial constraints faced by LDCs are appearing in slightly different forms in Los Angeles and New York. More long-term planning goes into tariff setting in LDCs than in developed countries. Three factors (narrow revenue base, rapidly growing demand, and resulting necessity to explore alternative service levels) have shaped water utilities' rate-making philosophy in LDCs. Most LDCs have some type of increasing block tariff whereas in the U.S. declining block tariffs are widespread. Some water systems in LDCs are designed for consumption levels lower than 200-400 l pdc or without sufficient pressure to meet peak demands, these are cost-saving alternatives. The widely shared concern that the poor be provided with at least minimal water service at low cost forces LDCs to include marginal cost pricing for large customers. The U.S. is experiencing problems similar to those of LDCs. Local resource base in U.S. cities is limited by growing demands of competing needs gaining approval of new bond issues which finance water and sewer expansion is increasingly difficult. Although water demand in the U.S. is not expected to grow more rapidly than in the past, the changing supply situation results in conditions similar to those in LDCs. The most effective way to encourage conservation is by pricing water used in excess of basic sanitation needs at its full marginal cost. (Danovich-Wisconsin)

WATER SCARCITY AND THE POLITICS OF PLENTY IN THE FOUR CORNERS STATES,
Arizona Univ., Tucson.
H. Ingram, N. Laney, and J. R. McCain.
The Western Political Quarterly, Vol 32, No 3, September 1979. p 298-306. 9 p, 3 Tab, 21 Ref. OWRT B-056-ARIZ(3), 14-34-0001-7111.

Descriptors: *Water policy, *Water allocation(Policy), *Water supply, *Administration, Colorado, New Mexico, Arizona, Utah, Agriculture, Irrigation water, Urbanization, Colorado River Basin, Legislation.

The allocation of water resources in the fast growing arid Four Corners states of Arizona, New Mexico, Colorado, and Utah is examined. In this area demand is rapidly growing for a limited supply of water due to urban growth, energy development, and Indian tribe claims. Historically agriculture has used 80 to 90% of surface and groundwater for irrigation. While this level of consumption currently remains high the contribution of agriculture the area's economy has sharply declined. It is unlikely that supplies will be substantially increased in the future due to the near exhaustion of good dam sites and water project funding cut backs by the Carter Administration. Many economists, water lawyers, and other observers recommend reallocation of water from less to more economic uses such as away from agriculture and toward cities. Such reallocation would require State legislative action. A survey of voters and legislators showed that both groups are not readily willing to make trade-offs among users. The survey indicated that the voters desired more or the same amount of water for agriculture in the future. Senators want to give the same water to agriculture but also recognize the growing needs of other users. Voter preferences make policy options open to legislators politically difficult or infeasible which probably means that the State legislatures will not take an active role in water policy. Crucial decisions will be left to the courts, the executive, special commissions, and negotiations among interest groups or the market. (Seigler-IPA)

MANAGING A LIMITED RESOURCE: THE POLITICAL CONTRAINTS ON WATER POLICY IN THE FOUR-CORNERS STATES,
Arizona Univ., Tucson.
H. Ingram, N. Laney, and J. R. McCain.
The Utah Law Review, Vol 1979, No 4, p 719-745. 17 Tab, 31 Ref OWRT B-056-ARIZ(2), 14-34-0001-7111

Descriptors: *Water policy, *Water allocation(Policy), *Water supply, *Administration, Colorado, New Mexico, Arizona, Utah, Recreation, Agriculture, Irrigation water, Industrial water, Urbanization, Colorado River Basin, Legislation

The opinions of State senators and voters about water allocation, water scarcity, and related water issues in the Colorado River Basin states of Arizona, Colorado, New Mexico, and Utah are examined and compared. Water policy questionnaires were mailed to a sample of 50 voters, stratified by party registration, in each State legislative district and to State senators in 1975-1976. Presently agriculture is the largest user of western water followed by municipal and industrial uses, minerals, thermal electric uses, and recreation, fish, and wildlife uses. Both senators and voters wish all users to get more water in the future or at least the same proportion of available water. The problem is that in these four states demand is increasing while the physical limits of ground and surface water have nearly been reached. Pressure for more water or reallocation will increase if urban growth continues and energy development occurs. Survey respondents declined to set priorities or to suggest tradeoffs as solutions. Such priorities might be increased water prices for urban water or increased water prices for farm water. While the voters favored more water to agriculture the senators were more sensitive to urban populations. There is little indication that legislators are willing to take either the credit or the blame for water policy decisions and it is likely that they will delegate this responsibility to others if possible. Voters appear somewhat unwilling to accept changes in water policy. This unwillingness to accept change coupled with the lack of legislative incentive make it likely that water policy in the future will be little changed from past or current water policy. (Seigler-IPA)

AN OPTIMAL SAMPLING PROCEDURE FOR THE COLLECTION OF RESIDENTIAL WATER USE DATA,
Johns Hopkins Univ., Baltimore, MD.
S. H. Hanke, and A. Mehrez.
Water Resources Research, Vol 15, No 6, p 1343-1348, December 1979. 1 Fig, 7 Tab, 7 Ref.

Descriptors: *Sampling, *Water users, *Data collections, *Statistics, Water supply, Water demand, Climates, Optimization, Data processing, Statistical methods, Analytical techniques, *Sampling theory, Residential water use.

Sampling theory was used to design an optimal sample of individual residential water users for the United States. The purpose of designing this optimal stratified random sample was to facilitate an efficient nationwide collection of residential water use data which can be analyzed statistically to forecast water use and to determine water system design criteria. This sample was designed in two steps: (1) the specific type and number of customers to be sampled at each location and (2) the specific locations to be sampled. (Sims-ISWS)

DOMESTIC WATER SUPPLIES, HEALTH AND POVERTY: A BRIEF REVIEW,
R. Feachem.
Water Supply and Management, Vol 2, No 4, p 351-362, 1978. 3 Fig, 31 Ref.

Descriptors: *Domestic water, *Public health, *Water-related diseases, *Diseases, *Water quality, *Rural areas, *Water pollution effects, Poverty, Human diseases, Social aspects, Water purification, Planning, Water supply, Epidemiology, Water quality control.

The magnitude of the world problem of providing adequate domestic water supplies for people is immense and progress at present is slow. Improved domestic water supplies hold out the hope of improved health. The fundamental prerequisite for any understanding of water supplies and health is the classification of water-related infections. These

are: (1) fecal-oral diseases; (2) water-washed diseases; (3) water-based diseases; and (4) water-related insect vector. Studies on the impact on health of domestic water supplies has revealed that there is (1) a wide-spread tendency to fail to demonstrate any marked association between water quality and diarrheal disease; (2) provision of public taps in a community may not itself change hygiene or water use patterns and may not even increase the volume of water used per capita; and (3) where the availability of water is greatly improved a marked reduction in water-related disease may be found. However, installation of improved water supply sources may lead to a reduction of water-borne transmission of the fecal-oral group of diseases without reduction of diseases in the other groups. Investigations into the impact of water supplies are often complex, costly and time consuming. There will clearly be no widespread health benefits unless a country has an efficient and effective rural water program. A major increase in the amount of evaluation work undertaken would be beneficial in promoting improvements in program planning, policy and execution. (Iervolino-NC)

SOME POLICY IMPLICATIONS OF WATER DEVELOPMENT,
Biswas and Associates, Ottawa (Ontario).
A. K. Biswas.
Water Supply and Management, Vol 2, No 3, p 215-226, 1978. 6 Tab, 17 Ref.

Descriptors: *Water development, *Policy, *Political aspects, *Water resources development, *Developing countries, *Decision-making, *Water supply development, Administration, Planning, Water allocation, Water utilization, Agriculture, Industry, Hydroelectric power, Social aspects, Environmental aspects, Water resources, Water management(Administrative).

More and more water will be necessary to satisfy basic human needs because of the continuing increase in world population and the rising standard of living. The quality and quantity of water required to satisfy demands vary considerably depending on type of demand, geographical locations, cultural traditions, standards of living, climatic characteristics and other individual factors. Policy options for uses of water are divided into the following major sectors: rural and urban water supply, water for agriculture, water for industry and hydroelectric power. The social and environmental impacts of water development can be best considered by dividing the effects into three categories of subsystems: physical, biological and human. The physical subsystem includes the hydrologic system, atmospheric system and crusted system. The biological subsystem includes the aquatic ecosystem and the terrestrial ecosystem. The human subsystem is divided into the production system and the sociocultural system. Integrated water management must be insured so that improvement in one sector should not take place at the cost of another. The agricultural sector, which accounts for nearly 80% of the global water consumption, is probably the most inefficient sector and is where most improvements could be made. The problem of water availability in the future is basically a problem of more rational and better management systems. (Iervolino-NC)

MANAGEMENT OF RURAL WATER SUPPLIES,
G. Schultzberg.
Water Supply and Management, Vol 2, No 4, p 333-340, 1978.

Descriptors: *Rural water supply, *Water supply, *Water supply development, *Developing countries, *Water resources development, Administration, Operation and maintenance, Construction, Project purposes, Regional development, Resources, Public health.

In most developing countries rural water programs have emerged from the ministries of health in their efforts to prevent water-borne and water-related diseases. In many countries these programs have remained in the health ministries but in some countries the rural program has been transferred to the urban water supply agency. In other countries rural water supply is seen as a complement to rural development programs and thus is the responsibility of agriculture ministries. Many countries do not have a national target and clearly defined policies for rural water supply development. In place of this is a project-by-project approach which is directed by what external financial and technical resources can be acquired. In the formulation of national programs the following variables are taken into account: (1) priority areas and selection of schemes; (2) level of service to be provided; and (3) participation of the potential beneficiaries and their contribution towards the program. The technology used in the program is often determined by the physical conditions and the options are limited. The choice is between a groundwater or surface-water source; groundwater is generally more reliable. Construction work is carried out with paid laborers or with the help of free self-help labor from the potential beneficiaries. Operation and maintenance problems are ever increasing and are due to under-estimated budget proposals, insufficient allocations and the lack of trained and skilled persons to do the job. Such agencies as UNICEF, WHO and the World Bank have been providing technical and financial assistance to solve these rural water supply programs. In addition to these agencies individual countries such as Sweden, Canada, USA, the Netherlands and West Germany have been making big contributions. (Iervolino-NC)

ENVIRONMENTAL IMPLICATIONS OF WATER DEVELOPMENT FOR DEVELOPING COUNTRIES,
A. K. Biswas.
Water Supply and Management, Vol 2, No 4, p 283-297, 1978. 3 Tab, 30 Ref.

Descriptors: *Environmental effects, *Water resources development, *Water supply development, *Planning, *Project purposes, *Public health, *Water quality, Disease, Ecology, Irrigation effects, Administration, Social aspects, Water supply, Biology, Physical properties, Human diseases, Potable water, Reservoirs.

The environmental implications of water resources development can be divided into three categories of sub-systems: physical, biological and human. The physical sub-system can be further divided into the hydrologic, atmospheric and crustal systems. Water development projects invariably change river and ecosystem regimes; therefore the issue is not whether the environment will be affected but rather how much change is acceptable to society as a whole, and what countermeasures should be taken to keep the adverse changes to a minimum, at a reasonable economic cost. The biological sub-system is divided into the aquatic ecosystem and terrestrial ecosystem. Changing the biological sub-system affects the quality and availability of potable water. This in turn either reduces or increases health hazards such as cholera, typhoid, infectious hepatitis and other water-borne diseases. Water resources developments do not only bring unmitigated benefits; they also often are responsible for unanticipated social costs. Thus in irrigation developments in tropical and semi-tropical regions a secondary effect is the spreading of parasite water-borne diseases because of the creation of favorable ecological environments for these diseases. The impacts of water developments on the human sub-system could be direct or indirect, stemming from direct effects on physical and biological sub-systems. This addition of environmental quality to the traditional objectives of water resources development of economic efficiency and regional income redistribution has made the planning process more complex than ever before. Inclusion of environmental quality as an objective recognizes the fact that the welfare of society has dimensions besides economics; the issue is how it should be incorporated objectively within the planning framework. Planners must give emphasis to the social and environmental consequences of water development projects. (Iervolino-NC)

THE POLLUTION CONTROL TAX INCENTIVE: A NON-INCENTIVE,
Missouri Univ., Columbia.
L. A. Nikolai, and R. Elam.
The Accounting Review, Vol 54, No 1, p 119-131, January 1979. 2 Fig, 8 Tab, 13 Ref.

Descriptors: *Pollution taxes(Charges), *Taxes, *Economic efficiency, Certified Pollution Control Facility(CPCF) policy, Regulation, Investment, Return(Monetary), Amortization, Depreciation, Pollution abatement, Equipment, Capital costs, Economics, Government supports.

In 1976 Congress re-enacted the Certified Pollution Control Facility (CPCF) policy under the assumption that federal subsidies in the form of a significant decrease in federal taxes would serve as an incentive to stimulate pollution control investments. However, the present-value federal income tax impact model developed in this study presents substantial evidence that CPCF does not serve as an incentive. In many cases, assuming that firms operate within a 10-20% cost-of-capital range, CPCF does not yield additional present-value tax savings over and above those which would arise from the usual accelerated depreciation deduction and available investment tax credit. Only when the facility has at least a 10-12 yr life for continually profitable manufacturing firm paying no minimum tax, or at least a 14-19 yr life for a manufacturing firm paying no minimum tax, is the CPCF alternative financially attractive. Even then, on an investment of $1 million, maximum tax savings amount to less than $66,000 (or 6.6% of the investment) for profitable firms investing in a facility with a 26 year life. Tax savings are substantially less for a firm in an initial net operating loss position. In addition, due to rapidly improving technology in pollution control equipment, firms will probably prefer shorter-life facilities. Finally CPCF may not be worth the additional paperwork required to obtain certification. (Harris-Wisconsin)

ENVIRONMENTAL PROBLEMS OF DEVELOPING COUNTRIES,
Urban Development Inst., Bombay (India).
R. Mayur.
Annals of the American Academy of Political and Social Sciences, Vol 444, p 89-101, July 1979.

Descriptors: *Environmental control, *Pollution, *Less-developed countries, *India, *Human population, *Adoption of practices, *Social aspects, Environmental effects, Air pollution, Pollution abatement, Water pollution, Urbanization, Human pathology, Diseases, Industrial production, Long-term planning, Planning, US Environmental Protection Agency, Conservation, Forest management, Growth rates, Environment.

A growing world crisis of under-developed countries, in which uncontrolled population growth, urbanization and substandard environmental protection arrangements combine to cause incalculable social misery, is exemplified by India. That country's 635 million population, increasing at an annual 2%, will number 900 million by the end of the century. Per-capita income is $150, only 130 million metric tons of food are produced each year, and only 40% of the population get safe water for drinking and personal hygiene. India's environmental problems include pollution of air and water, cacophonious noise in the cities, and increasing land pollution through uncontrolled solid waste disposal. By the next century, one-third of the population will be living in 5,000 urban settlements and increased industrialization will have intensified environmental problems even beyond today's unthinkable levels. Immediate envi-

ronmental management steps are needed. Recommendations for action include: (1) Decentralization of population growth and industrialization through urban systems planning. (2) Industrial pollution control through government incentives to private firms in the form of financial assistance to purchase and install modern pollution control equipment. (3) Establishment of an Environmental Planning Ministry to function similar to the US Environmental Protection Agency with broad national and state powers. (4) Development of conservation and reforestation movements, including green belt developments around large cities. (5) Establishment of nationwide educational programs to foster environmental ethics. (Harris-Wisconsin)

LIABILITY WITHOUT FAULT UNDER THE FEDERAL WATER POLLUTION CONTROL ACT,
B. Valdez-Ferreira.
Natural Resources Journal, Vol 19, No 3, p 687-692, July 1979.

Descriptors: *Legal aspects, *Federal Water Pollution Control Act, *Oil spills, Penalties(Legal), *Judicial decisions, Legislation, Water Quality Act, Fuels, Gasoline, Tex-Tow, Inc., Marathon Pipe Line Company, Mississippi River, Kaskaskia River, Illinois, Acts of God, Law enforcement, Regulation, Coast Guard regulations.

A legal review is made of two cases heard before the Seventh Circuit Court of Appeals, in which a federal appeals judge reluctantly decided that a river barge line operator and an overland pipeline company were both responsible for civil penalties assessed by the Coast Guard for separate but major oil spills into navigable waters. In 1974, 1600 gallons of gasoline went into the Mississippi River when a tank barge operated by Tex-Tow, Inc. was punctured. The following year 19,992 gallons of crude oil were discharged into the Kaskaskia River in southern Illinois from a pipeline owned by Marathon Pipe Line Company; more than half the oil escaped downriver. Both firms were penalized under Section 1321(b)(6) of the Federal Water Pollution Control Act, by the United States District Court for the Eastern District of Illinois. The appeals court affirmed the earlier finding and held each defendant subject to the civil penalty even though the enterprises were not at fault and the spills were caused by third party acts or ommissions. These cases essentially mean that polluters may be charged with liability without causation; the courts found that substantive due process claim by the defendants had been struck down by the U. S. Supreme Court as early as 1937 (in a price control case). The judges, in summation, found that unjustified penalties such as those imposed on Marathon and Tex-Tow are eventually passed on to the consuming public, but that it is important for polluters to pay for pollution in such large-scale spills. WOOD PULP, WATER POLLUTION, AND ADVERTISING,
California Univ., Los Angeles. Dept. of History.
J. G. Burke.
Technology and Culture, Vol 20, No 1, p 175-195, January 1979. 5 Tab.

Descriptors: *Pulp and paper industry, *Water pollution sources, *Advertising industry, *Social aspects, *Technology, Lumbering, Industrial wastes, Pulp wastes, Social change, History, Social needs, Social impact, Suspended solids, Industrial production, Waste water(Pollution).

The relationship between the mounting volume of printed advertising in the United States and the increasing pollution of the nation's waters is explored in a study which traces the growth of American advertising in historical context, a perspective which assumes that advertising will continue to flourish and cause increased water pollution levels. Technological progress in the late 19th century created a demand for novel and effective techniques of marketing mass-produced products, and advertising filled this demand as an optimal solution. At the same time, technology in the form of new processes for wood pulping made sufficient quantities of newsprint, paper and paperboard available at low cost to permit the advertising industry to grow and prosper. All this resulted in massive water pollution. Of 61.9 million tons of paper and paperboard produced in the US in 1973, at least 50% was used for advertising and for packaging and shipping advertised products. In 1963 the pulp and paper industry was responsible for 16.7% (3 billion lb) of settleable and suspended solids in all US industrial wastewater. Advertising is thus directly responsible for an additional large percentage. (Harris-Wisconsin)

OFFENSES AGAINST THE ENVIRONMENT AND THEIR PREVENTION: AN INTERNATIONAL APPRAISAL,
G. O. W. Mueller.
Annals of the American Academy of Political and Social Science, Vol 444, p 56-66, July 1979.

Descriptors: *Air pollution, *Water pollution, *International law, *Jurisdiction, *Law enforcement, Environment, Pollutants, Legal aspects, Political aspects, Judicial decisions, United Nations, Regulation, Public rights, Governmental interrelations, Governments, Boundaries(Property).

Little effort has been made to utilize criminal sanctions of international law to control pollution, even though pollutants and their effects do not stop at jurisdictional boundaries. The International Court of Justice at the Hague, a United Nations organ, has no criminal jurisdiction and a United Nations International Criminal Court is not yet fully developed. Therefore, no effective mechanism for international criminal law exists. However, certain pollutiona offenses have become international criminal law by being subjected to universal jurisdiction under national law, such as the negligent release of nuclear energy or dumping pollutants from ships or aircraft into the Mediterranean Sea. Several problems are inherent in using international criminal sanctions in order to control internationally significant environmental pollution: qualification and quantification; strict liability; vicarious liability; corporate liability; proof; abuse of power; inadequate enforcement; changing priorities; trends toward decriminalization; and countervailing penalization policies. Significant pollution is a complicated industrial activity involving a large number of persons with ill-defined responsibilities, thus causing vicarious liability. Difficulties also arise because regulatory provisions are often complex and verbose, if not unintelligible, and therefore enforcement actions take a long time and are often ineffective. NEWFOUNDLAND'S CLAIM TO OFFSHORE MINERAL RESOURCES: AN OVERVIEW OF THE LEGAL ISSUES,
Windsor Univ. (Ontario). Faculty of Law.
J. Arvay.
Canadian Public Policy, Vol 1, p 32-44, Winter 1979. 12 Ref.

Descriptors: *Legal aspects, *Federal-state water rights conflicts, *Canada, *Newfoundland, *Continental shelf, Federal jurisdiction, State jurisdiction, Water rights, Political aspects, Ownership of beds, Seashores, Reservation doctrine, Federal government, State governments, Water policy, Natural resources, Resources development.

An overview is presented of legal issues involved in a dispute between Newfoundland Province and the federal Canadian government in regard to disposition and ownership of natural resources lying beneath the sea off Newfoundland's coast. Newfoundland's sovereignty prior to its joining the Canadian Conferenation may not be established by the Canadian Supreme Court. If so, only common law applies, subject to a possible finding that the British Imperial Crown bestowed upon Newfoundland (in its previous status as a Crown Colony) sufficient jurisdiction to establish the colony's proprietary rights over any or all adjacent offshore regions; if Newfoundland's sovereignty prior to its joining the Canadian Confederation is so established, then Newfoundland rather than Canada possesses property and jurisdictional rights. Parliament would retain right to legislate navigation, shipping, fisheries and defense. Alternatives are offered of possible ways to resolve the dispute: (1) Newfoundland would retain property rights to offshore land but plenary jurisdiction over such property would lie with Parliament. (2) The court could regard Newfoundland's pre-Confederation status as irrelevant and conclude that jurisdiction and ownership over offshore lands lies with Canada. Policy considerations rather than jurisprudence alone are likely to be most important in deciding this case. (Harris-Wisconsin)

ENVIRONMENTAL ALTERNATIVES AND SOCIAL GOALS,
DuPont Co., Wilmington, DE.
R. E. Heckert.
Annals of the American Academy of Political and Social Science, Vol 444, p 102-111, July, 1979.

Descriptors: *Environment, *Alternative planning, *Political constraints, *Social values, Social aspects, Political aspects, Decision making, Technology, Value, Regulation, Administration, Governmental interrelations, Institutional constraints, Standards, Costs, Benefits, Economics.

If no imminent threat to public health and safety exists, the preferred way to attain specific environmental goals is to make cost-effective improvements that are affordable, but defer other actions until technology or improved economics permit another cost-effective goal. When considering environmental alternatives, many key decisions involve social issues as much as scientific issues. Technology alone does not solve problems. Value judgements must be made and consensus politics developed if success is to be achieved. A solid consensus is needed on environmental goals. Trade-offs required to implement existing environmental programs and directives are not recognized or are regarded as inconsequential compared with benefits. The current political process involving environmental issues does not thoughtfully consider all relevant data nor allow the flexibility needed to move toward specific objectives. Overlapping responsibilities among agencies dealing with health and environmental problems lead to fragmented consideration of issues with broad impact and failure to look at the totality of regulation. Political and social scientists have an important role in this overall process. (Danovich-Wisconsin)

THE ECOSYSTEM APPROACH; SCOPE AND IMPLICATIONS OF AN ECOSYSTEM APPROACH TO TRANSBOUNDARY PROBLEMS IN THE GREAT LAKES BASIN.
International Joint Commission-United States and Canada, Windsor (Ontario). Great Lakes Science Advisory Board.
Special report, July 1978. 47 p, 14 Ref, 1 Append.

Descriptors: *Canada, *International commissions, *International Joint Commission, *Ecosystems, *Water pollution sources, Boundary Waters Treaty of 1909, Great Lakes Water Quality Agreement of 1972, *Great Lakes, Air pollution, Acid rain, Salts, Governments, Legislation, Water policy, Water law, Social aspects, Human population, Ecology.

An approach utilizing a man-in-a-system concept is suggested to replace the system-external-to-man concept inherent in the 1972 Great Lakes Water Quality Agreement between Canada and the United States. Incorporation of the newer approach within advisory and management functions of the two countries would necessitate political

recognition of the Great Lakes Basin as an ecosystem composed of the interacting elements of water, air, land and living organisms including human beings. Problems such as acid rain and harmful chloride concentrations could be better managed by adopting such an approach in the Great Lakes basin. Acid rain is caused by burning of fossil fuels and industrial processing; these activities add sulfur oxides and nitrogen oxides to the atmosphere. In 1970 Canada suffered an estimated $6.8 billion damages exported from the U.S. in the form of acid rain. Approximately 2.8 million metric tons of road salt per year are used in the basin for de-icing, leading to dangerous chloride concentrations in Lake Ontario. In addition, it is thought that an ecosystem approach by both countries might better control current unmanageable population growth in the Great Lakes area, which had 300,000 persons a century ago and 37 million persons today. It is recommended that the U.S. and Canada extend or amend the Boundary Waters Treaty of 1909 and the Great Lakes Water Quality Agreement of 1972 in accordance with the philosophy of ecosystem approach outlined in the paper. WEST EUROPEAN INSTITUTIONAL ARRANGEMENTS FOR ENVIRONMENTAL POLICY IMPLEMENTATION-ESPECIALLY AIR AND WATER POLLUTION CONTROL,
Akron Univ., OH. Dept. of Urban Studies.
W. R. Mangun.
Environmental Conservation, Vol 6, No 3, p 201-211, Autumn 1979. 32 Ref.

Descriptors: *West Europe, *Policy, *Governments, *Organizations, *Environmental control, Environment, Water pollution, Water pollution control, Air pollution, Institutions, Political aspects, Legislation, Regulation, Law enforcement, Institutional constraints, United Kingdom, Belgium, Denmark, Italy, The Netherlands, West Germany, France, Norway, Sweden, Switzerland.

Basic environmental policy stances, institutional arrangements and implementation approaches of several West European countries are examined. Enactment of new pollution control legislation, accelerated institutional innovation and agency reorganization throughout West European countries in the 1960s and 1970s led to an ever-increasing enforcement burden. However, no solution common to all countries tackles this problem. Some countries created new and independent agencies such as the United Kingdom's Department of the Environment. Other countries simply reorganized existing agencies. This pattern developed with the Ministry of the Interior in West Germany and in the Ministry of Public Health and Environmental Hygiene in the Netherlands. Other countries, such as Italy, did not substantially alter their organizational structure to deal with environmental problems. Pollution control approaches varied significantly. Some countries, such as Sweden, adopted comprehensive pollution-control policies which cover all basic areas: air, water and land. Other countries, such as the United Kingdom and West Germany, developed vigorous air pollution control policies while France developed strong water pollution control. In most countries, policy development was incremental, with expansion and improvement of basic pollution control laws. Countries examined were: United Kingdom, West Germany, The Netherlands, Italy, France, Norway, Sweden, Switzerland, Belgium, and Denmark. (Danovich-Wisconsin)

7. RESOURCES DATA

7A. Network Design

DESIGN OF OPERATIONAL PRECIPITATION AND STREAMFLOW NETWORKS FOR RIVER FORECASTING,
GKY and Associates, Inc., Alexandria, VA.
R. U. Jettmar, G. K. Young, R. K. Farnsworth, and J. C. Schaake, Jr.
Water Resources Research, Vol 15, No 6, p 1823-1832, December 1979. 7 Fig, 8 Ref.

Descriptors: *River forecasting, *Network design, *Precipitation(Atmospheric), *Streamflow, *Pennsylvania, Model studies, Hydrograph analysis, Gaging stations, Watersheds(Basins), Operations, River basins, Methodology, Mathematical models, Networks, Time lag, Hydrographs, *Susquehanna River Basin(PA), Gage density.

A methodology is presented for assessing the value of river forecasting to possible changes in existing precipitation and streamflow networks. This study was undertaken as a part of an effort to evaluate the expected benefit of automating all or part of the data-gathering networks used by the National Weather Service. A surrogate measure of benefits, called the 'mean forecast lead time,' is related indirectly to benefits because the value of river forecasting depends on the lead time available for the flood plain dweller to take action and respond to the forecast. Presented was the rationale for the methodology and the results of part of the research using streamflow generated by Hurricane Agnes (June 1972) and Hurricane Eloise (September 1975) for the Susquehanna River basin. The methodology can be used to analyze the issues of network design including gage density, automation, gage down time, network timing relationships, effects of rain forecasts, and model and other sources of error. The method can be used to evaluate existing networks. Given network and modeling automation, the method can be used to automatically select the network response time. It was recommended: A more detailed analysis and investigation of the Susquehanna data base should be undertaken. The linkage to benefits should be extended and pinned down with an objective of direct benefit estimates being generated as functions of network design parameters. The methodology should be generalized to the current generation of state-of-the-art conceptual rainfall-runoff models being introduced within NWS. An analysis should be conducted with the methodology on sufficiently general data sets to enable the generation of network design guidelines and criteria. (Humphreys-ISWS)

SAMPLING OF INTERRELATED RANDOM FIELDS: THE RAINFALL-RUNOFF CASE,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
R. L. Bras.
Water Resources Research, Vol 15, No 6, p 1767-1780, December 1979. 16 Fig, 2 Tab, 18 Ref.

Descriptors: *Hydrology, *Sampling, *Stochastic processes, *Network design, Reviews, Model studies, Forecasting, Hydrograph analysis, Mathematical models, Rainfall, Discharge(Water), Runoff, Watersheds(Basins), Rainfall disposition, Streamflow, Flood forecasting, Networks, Peak discharge, Gage density.

The rainfall-runoff process is the most common vector-valued random field studied by hydrologists. A historical review of four articles dealing with the sampling of this multivariate problem is presented. Ideas on new formulations to study the sampling needs for rainfall-runoff modeling are given. The main goal was to illustrate the development of ideas from a deterministic, linear frequency domain approach to a nonstationary, nonlinear treatment of random fields. The state of the art is encouraging, but a lot remains to be done. Areas of needed theoretical improvements are identified, and ideas on future approaches suggested. (Humphreys-ISWS)
W80-03940

CONSIDERATIONS FOR THE DESIGN OF A HYDROLOGIC DATA NETWORK USING MULTIVARIATE SENSORS,
National Weather Service, Fort Worth, TX. Southern Region.
K. C. Crawford.
Water Resources Research, Vol 15, No 6, p 1752-1762, December 1979. 5 Fig, 2 Tab, 34 Ref, 1 Append. BOR 6-07-DR-20050.

Descriptors: *Network design, *Hydrologic data, *Model studies, *Sampling, Rainfall, Mathematical models, Statistical models, Meteorological data, Rain gages, Stations, Networks, Statistical methods, Spatial distribution, Temporal distribution, Analytical techniques, Algorithms, Sensor location, Gage density.

An experimental design model has been developed to evaluate trade-offs involved in the optimal sampling of surface rainfall. The model reveals that deployment of statistically adequate sensor arrays depends critically on the storm physics, the sensor engineering aspects, and the procedure chosen for analysis of information from the deployed network. The model was used to examine the effect of sensor density reduction on the ability of a sampling system to detect signal variation. Predictand-related sensors were shown to be essential to network design. Options in multivariate sensor deployments (spatial and temporal) are explained. Deployment along and across a preferred storm track is related to convective system anisotropy, rain gage density, temporal sampling intervals, availability of radar data, and interrelationships among the multivariate predictor data sets. Any proposed sensor array was shown to represent a balance between the demands of economy and climatology. A maximum of 10 gage sensors within the coherent convective storm area is sufficient to fully explain and sample the significant signal variance of a representative High Plains convective system. A reasonably accurate surface rainfall analysis is possible using gage sensors spaced 60 sq km/gage. An equivalent analysis is obtained from good radar data and a gage density of 190 sq km/gage. Analysis accuracy in the gage network is improved only 10% when the gage density is increased to 50 sq km/gage. Quality radar data combined with gage information spaced 50 sq km apart produce 65% less sampling error variance than observed in the best sampling from gage information alone. (Humphreys-ISWS)
W80-03941

STATISTICAL CONSIDERATIONS IN NETWORK DESIGN,
Stanford Univ., CA.
P. Switzer.
Water Resources Research, Vol 15, No 6, p 1712-1716, December 1979. 2 Fig, 1 Tab, 4 Ref.

Descriptors: *Network design, *Statistical methods, *Stations, Mathematical studies, Systems analysis, Spatial distribution, Variability, Monitoring, Analytical techniques, Statistics, Error calculations.

After discussing general considerations on the importance and unimportance of optimization in spa-

tial network design, the author indicated how one might exploit spatial autocorrelations and covariate information. It was pointed out that spatial autocorrelations themselves require care in their estimation. Two illustrations showed how probabilistic error calculations are made for mapping problems using network station data. One illustration used a quantitative mapping variable, and the other used a qualitative mapping variable. (Humphreys-ISWS)

DENSE NETWORKS TO MEASURE CONVECTIVE RAINFALL IN THE SOUTHWESTERN UNITED STATES,
Science and Education Administration, Tucson, AZ. Southwest Rangeland Watershed Research Center.
H. B. Osborn, K. G. Renard, and J. R. Simanton.
Water Resources Research, Vol 15, No 6, p 1701-1711, December 1979. 11 Fig, 4 Tab, 13 Ref.

Descriptors: *Networks, *Rainfall disposition, *Demonstration watersheds, *Arizona, *New Mexico, Sampling, Rain gages, Watersheds(Basins), Hydrologic data, Areal, Measurement, Spatial distribution, Rainfall, Thunderstorms, Analysis, Analytical techniques, Depth-area curves, Distribution patterns, Isohyets, Correlation analysis, Runoff, *Walnut Gulch(AZ), *Alamogordo Creek(NM), Dense networks, Rain gage networks.

Almost all rangeland runoff in the southwestern United States results from intense short duration rainfall of limited area extent. In 1953, two southwest rangeland watersheds, the 150-sq km Walnut Gulch and 174-sq km Alamogordo Creek watersheds, were selected as outdoor laboratories to measure water yield from rangeland watersheds. The networks were planned initially with gages on a 1-mi grid, but difficulties in access resulted in more uneven networks, and the basic networks were not completed until 1961. Gages were added after 1961, both for better estimates of rainfall on very small intensive study areas and to fill 'gaps' in the original network. Summer storms in eastern New Mexico where frontal convective thunderstorms occur can have greater areal extent and point rainfall maximums. The simple correlation for total thunderstorm rainfall between pairs of gages decreases very rapidly with increasing distance between the gages. On the basis of the Walnut Gulch and Alamogordo Creek data, for r = 0.4 the gages could be 5 and 10 km apart, respectively. For a simple correlation of 0.9 the gages should be 0.9 and 1.3 km apart, respectively, suggesting rain gage networks of 230 and 100 gages, respectively. Gage networks that differentiate from the hypothetical network can lead to serious overestimates or underestimates of the rainfall volume for a given watershed. The isohyetal maps constructed using different networks illustrated the magnitude of the difference at Walnut Gulch. For air mass thunderstorms, relatively closely spaced gages (about 6 km, r = 0.2, on Walnut Gulch) can be assumed to be independent sampling points for determining recurrence intervals of extreme values. Estimates of the rainfall energy factor R of the universal soil loss equation (USLE) require closer spacing of the gages than does a rainfall estimate alone. Thus for erosion research on small watersheds (10 ha or less) the gage should be within or very near the area. (Humphreys-ISWS)
W80-03943

DEVELOPMENT OF HYDROMETRIC NETWORKS IN BRITISH COLUMBIA,
Water Survey of Canada, Vancouver (British Columbia).
W. L. Kreuder.
Water Resources Research, Vol 15, No 6, p 1677-1686, December 1979. 5 Fig, 3 Tab, 13 Ref.

Descriptors: *Networks, *Hydrologic data, *Canada, *Network design, Stream gages, Gaging stations, Regional analysis, Streamflow, Hydrology, Drainage area, Data collections, Sampling, *British Columbia.

The growth and purposes of the Water Survey of Canada's British Columbia network were described from a practical point of view, tracing the progress toward a rational data gathering system. The network consists of several subnetworks of which three, the regional, the major stream, and the national inventory, were described in detail. As the major stream and national networks are reasonably simple in purpose and operation, the major part of the discussion was concerned with the regional network whose main purpose is the transfer of information. To meet this purpose and to analyze the performance of the network, certain procedures for the organization of data have been employed. These procedures included data banks for both hydrologic quantities and grid square extracted physiographic characteristics and regression analysis for relating the quantities in these data banks. The discussion outlined the British Columbia experience of sampling and transferring data in a diverse and primarily mountainous terrain. (Humphreys-ISWS)

DIMENSIONALITY PROBLEMS IN WATER QUALITY NETWORK DESIGN,
Washington Univ., Seattle. Dept. of Civil Engineering.
D. P. Lettenmaier.
Water Resources Research, Vol 15, No 6, p 1692-1700, December 1979. 35 Ref.

Descriptors: *Water quality, *Network design, *Sampling, *Methodology, Reviews, Networks, Analytical techniques, Variability, Design, Stochastic processes, Statistical methods, Monitoring, Time series analysis, Kriging, State estimate theory.

Dimensionality problems in design of water quality networks arise from the multiple variables measured, which may be generated by different physical, chemical, and biological processes, and from the multiple spatial and temporal dimensions of the processes generating the measurements. The problem is further complicated by the range of objectives which a network may be required to meet. The designer is almost inevitably constrained by budget considerations to employ the same network to measure an array of variables, often for more than one objective. These considerations serve to pose serious difficulties in arriving at an analytical formulation of the problem, far less to solve it, with the result that almost all existing water quality networks have been designed on an ad hoc basis. Although no one approach is likely to be universally applicable, several techniques have been employed in particular situations. Included are state estimation, time series analysis, probability theory, and the theory of regionalized variables. Several promising applications of these techniques to water quality network design were reviewed. Few of the approaches reviewed, however, are amenable in present form to solution of practical multivariate design problems. What is needed now is a regrouping, with a closer eye toward applications, especially in light of the multidimensional nature of the network design problems faced in meeting the needs of water quality data users. (Humphreys-ISWS)

WATER QUALITY SAMPLING: SOME STATISTICAL CONSIDERATIONS,
Johns Hopkins Univ., Baltimore, MD. Dept. of Mathematical Sciences.
A. M. Liebetrau.
Water Resources Research, Vol 15, No 6, p 1717-1725, December 1979. 10 Fig, 1 Tab, 30 Ref. USGS 14-08-0001-G-432.

Descriptors: *Water quality, *Sampling, *Network design, *Maryland, *Watersheds(Basins), Monitoring, Statistical methods, Statistical models, Analytical techniques, Stations, Networks, Biochemical oxygen demand, Dissolved oxygen, Variability, Probability, Analysis, Mathematical models, *John Falls(MD), Sequential methods.

Typically, a state, regional, or national water quality (WQ) monitoring system has many objectives. Examples include (1) providing a systemwide synopsis of WQ; (2) determining whether selected WQ parameters show gradual changes over time; (3a) detecting actual or potential WQ problems, (3b) determining the specific causes of actual problems, and (3c) assessing the effect of any corrective action; and (4) enforcing the law. While these purposes have different data requirements, they are interrelated, and data collected for any one can have value for others; for example, data collected for the listed reasons could be used for future long-range planning. Each objective makes certain demands of a WQ sampling network, and these in turn have implications concerning sampling design and statistical analysis of resulting data. In a sampling scheme flexible enough to encompass multiple objectives, data sets collected for answering questions arising under points 1-4 need not all have similar characteristics; consequently, a variety of statistical methods are needed. A good sampling design is important for achieving the first two objectives. A working definition of 'water quality' was given initially, and this was followed by the definition of a sampling population. The set of all segments of the drainage network serves as the population for several sampling plans. In particular, the use of probability sampling to design a network of synoptic sampling stations was discussed in detail. Finally, sequential statistical procedures were applied to a specific problem of type 3c. In terms of the amount of data required, sequential methods are quite efficient for detecting changes of a specified magnitude in some WQ parameter. (Humphreys-ISWS)

THE WORTH OF HYDROLOGIC DATA,
Dames and Moore, Washington, DC.
D. R. Dawdy.
Water Resources Research, Vol 15, No 6, p 1726-1732, December 1979. 1 Fig, 1 Tab, 39 Ref.

Descriptors: *Hydrologic data, *Network design, *Value, Decision making, Streamflow, Precipitation(Atmospheric), Variability, Economics, Stochastic processes, Costs, Sampling, Networks, Stations.

The collection of data implies a use and a worth for those data. The first data to be collected usually contain the most information and have the most worth. As more data are collected, their marginal worth decreases, whereas their marginal cost usually does not do so, or at least not to the same extent. Therefore an optimal network design would have the configuration which either (1) has the maximum worth for a given budget or (2) has a design such that the marginal worth of data is equal to its marginal cost. In principle, the optimal design is thus conceptually simple. However, in practice, the cost of data is obtainable, though usually with some difficulty and uncertainty. Worth, in economic terms, is much more difficult to assess. Optimal design of data networks requires a measure of the worth of data. Worth is use specific and difficult to measure. Surrogates to worth, usually some measure of accuracy, have been developed. These surrogates and attempts to translate them to economic measures are discussed. Advances toward realism make solutions more difficult. Simplicity of solution and ease of understanding are required if methods developed are to have any impact on decision makers. (Humphreys-ISWS)

A network of rain gages provides information about rainfall at only a limited number of points within a region: some procedure must then be adopted to estimate the rainfall for other chosen points and areas within the region. Methods were presented whereby the accuracy of rainfall estimates can be quantified so that a comparison with the requirements of users of rainfall data can be made. The calculation of the accuracy of optimal estimates based on any number and configuration of gages was described. The results can be applied to the redesign of existing networks of gages by mapping the root mean square error of point interpolation, allowing the identification of those areas where new gage sites are most needed to meet some specified criterion of accuracy. Formulae were also presented which allow the accuracy of an optimal estimate of areal rainfall to be calculated for any shape of area and any configuration of gages. (Humphreys-ISWS)

KRIGING IN THE DESIGN OF STREAMFLOW SAMPLING NETWORKS,
Institut National de la Recherche Scientifique, Rimouski (Quebec).
J-P. Villeneuve, G. Morin, B. Bobee, D. Leblanc, and J-P. Delhomme.
Water Resources Research, Vol 15, No 6, p 1833-1840, December 1979. 3 Fig, 4 Tab, 11 Ref.

Descriptors: *Sampling, *Streamflow, *Network design, *Model studies, Mathematical models, Analytical techniques, Statistical methods, Discharge(Water), Data processing, Stochastic processes, Gaging stations, Estimating, Optimization, Variability, Spatial distribution, Frequency, Ungaged sites.

Kriging is of particular interest in network design because of its ability to estimate streamflow values using existing stations. Another possibility offered by kriging is the estimation of variance reduction gained by addition of fictitious stations in regions of high variance. A brief description was given of kriging theory as developed at the Ecole des Mines de Paris. In order to improve and optimize the Quebec streamflow recording network design the authors kriged specific streamflows with a given return period over the Quebec province, using the data observed at existing stations. For the evaluation of the given return period flow and its sampling variance at each gaged site the authors used the log Pearson type 3 distribution model. Kriging is an optimal estimation technique, in terms of minimum variance, and contrary to other methods it gives an estimation variance for any point in the kriged domain, which is essential in network design. Network analysis and optimization are presently expensive and time-consuming undertakings. In this study of flows with given return periods, the authors demonstrated the aptitude of kriging to transpose information from gaged to ungaged sites and showed how the different elements of kriging can be used for network design. The Eaton River precipitation network was set up as one of the Quebec International Hydrologic Decade projects in 1965. At the end of the decade, in 1975, 30 stations had been in operation for most of the period in this 248-sq mi basin. After a principal components analysis of the data from 14 of the 30 stations on 10-day precipitation totals, it was found that the stations could be divided into three groups, the composition and geographic distribution of which change from season to season. It was also possible to identify which stations were redundant and could be closed should it become necessary. Application of optimal interpolation, season by season, to a 30- and a 5-station network showed that the precision of point interpolation varies more from season to season for the same network than from the 30- to the 5-station network for the same season. In fact, errors of interpolation caused by microclimatic irregularities and by observational errors in the initial data are greater than those resulting from the reduction of the network from 30 to 5 stations. RAINFALL MEASUREMENTS BY WEATHER RADAR: APPLICATIONS TO HYDROLOGY,
Research Council of Alberta, Edmonton. Atmospheric Science Div.
B. L. Barge, R. G. Humphries, S. J. Mah, and W. K. Kuhnke.
Water Resources Research, Vol 15, No 6, p 1380-1386, December 1979, 10 Fig, 21 Ref.

Descriptors: *Radar, *Flood forecasting, *Rainfall, Weather, Precipitation(Atmospheric), Rain, Hydrology, Rain gages, Areal, Data storage and retrieval, *Weather radar, *Rainfall measurements, *Alberta(Canada), Surface precipitation, Data management, Digital radar, Backscatter, Areal rainfall.

Surface precipitation measurements were improved by using both weather radar and conventional rain and snow gages. Advances in digital radar data management made possible improved precipitation estimates for hydrological applications such as flood forecasting. A project undertaken in Alberta provided areal precipitation data for operational flood forecasting. Maps depicting rainfall intensities were generated at specified time intervals from the Alberta Research Council's S band weather radar. Transmitted 150 km by telecopier to the Flow Forecasting Branch, Alberta Environment, the real-time radar-derived areal maps of precipitation were used with point surface observations to specify more precisely the precipitation events that led to floods. During precipitation events, weather radar data provided an indication of the applicability of point surface observations, which led to better operational flow forecasts. Radar measurements of rainfall intensity and rainfall amount were found to be of considerable benefit to operational and applied hydrologists. (Roberts-ISWS)

MULTIDATE LANDSAT LAKE QUALITY MONITORING PROGRAM,
Wisconsin Univ., Madison.
L. T. Fisher, F. L. Scarpace, and R. G. Thomsen.
Photogrammetric Engineering and Remote Sensing, Vol 45, No 4, p 519-527, April 1979. 6 Fig, 2 Tab, 7 Ref.

Descriptors: *Lakes, *Data storage and retrieval, *Remote sensing, *Water quality, *Trophic level, Wisconsin, Data collections, Satellites(Artificial), Mapping, Data processing, Data transmission, Computer programs, Landsat, Eutrophication, Monitoring, Navigation, Computers.

A remote sensing program by Earth satellite (Landsat) is described in which multidate scanning procedures are used to monitor water quality parameters and classify approximately 3,000 Wisconsin lakes larger than 20 acres. To cope with the major data collection problems involved in a process of this scope, unified files and programs were developed to automate and systematize data handling. Three files are described: One is a link-listed file structured to permit considerable processing versatility, containing latitude-longitude based polygons which delimit each lake. A second file is built up gradually as many Landsat scenes are processed, and allows storage of extracted data. A third file contains control point coordinates from throughout the state. Software consists of three programs. The first locates control points so that satellite coordinates can be measured for scene navigation. A second program produces navigation constants. A third locates all lakes covered by a Landsat scene and extracts data for storage in a statistical summary. Use of Landsat data means that ground coordinates can help identify irregularly shaped areas which can be repeatedly accessed. The method allows exploitation of Landsat's repeated coverage. MARS - A NEW INSTRUMENT FOR MEASURING PHYTOPLANKTON SINKING RATE,
Oceanic Inst., Waimanalo, HI.
G. N. Rothwell, and P. K. Bienfang.
Marine Technology Society Journal, Vol 12, No 5, p 13-17, October-November 1978. 7 Fig, 5 Ref.

Descriptors: *Phytoplankton, *Settling velocity, *Instrumentation, Equipment, Depth, Sinks, Population, Measurement, Cytological studies, Tracers, Tagging, Radioisotopes, Movement, Eutrophication.

The MARS (Multichannel Assembly for Radioplankton Sinking) technique is based on detection of the radioactive isotope C-14 which is assimilated by cells during a procedure used to determine production rates. Phytoplankton are radioactively labeled by adding C-14-bicarbonate to seawater

samples and allowing cells to take up C-14 by photosynthesis during an incubation period. After incubation, a subsample is placed as a discrete layer upon the surface of a seawater column. Labeled cells sink to the bottom, while the C-14 solution remains in the surface sample. Labeled cells are detected by Geiger-Muller systems and the phytoplankton's sinking rate is calculated. A MARS apparatus consists of a teleprinter, gas flow meter, high voltage power supply, micro-processor controller, gas supply, GM chamber chassis, motorized syringe and gimbal frame for damping ship motions. A typical time-course distribution from a sinking rate trial shows background counts; positive slope area marking arrival of labeled cells; and a plateau region reflecting decreased arrival rates when all but the slowest-sinking cells have reached the bottom. The mean cell population sinking rate is then calculated by an equation based upon numerical integration of the population arrival rate. The MARS system has been operated during two ocean cruises and has been extensively used in laboratories; trials produce reliable sinking rate measurements. (Danovich-Wisconsin)

WATER RESOURCE USES AND ISSUES IN TEXAS,
Texas Agricultural Experiment Station, College Station.
J. G. McNeely, and R. D. Lacewell.
Report B-1189, August 1978. 52 p, 4 Fig, 6 Tab, 61 Ref. 12 Photos.

Descriptors: *Texas, *Water resources, *Management, *Surface waters, *Groundwater, Planning, Water utilization, Water management(Applied), Aquifers, Droughts, Water quality, Water conservation, Agriculture, Estuaries, Reservoirs, Water yield, Industrial water, Municipal water, Water policy, *Ogallala Aquifer(TX), *Gulf Coast Aquifer(TX), *Edwards Aquifer(TX).

The purpose of this report was twofold--to review the current status of water resources in Texas relative to institutions and incidence of availability and use and to address some important water resource issues facing the state. Water resources to meet agricultural, municipal, industrial, and residential demands are taken from groundwater and surface water sources. Texas has a long-term annual availability of fresh water from ground and surface sources combined of at least 14.1 million acre-feet (maf). This includes a safe groundwater yield of 5.1 maf, defined as the quantity of average, annual recoverable recharge to groundwater aquifers. It also includes a firm surface water yield of at least 9.0 maf, defined as 'the quantity of water that can be withdrawn or released from reservoirs continuously, on an annual basis, over periods of time of sufficient length so as to span the most severe period of drought in the reservoir catchment areas.' Annual groundwater overdraft is lowering water tables, increasing pumping costs, and affecting the physical characteristics of individual aquifers. A landowner in Texas owns the groundwater beneath his land and has the right to drill wells and appropriate all of the underground percolating waters generally without regard to the effect upon other landowners. Two basic doctrines of surface water rights recognized in Texas are the riparian doctrine and the appropriation doctrine. The Texas Gulf Coast has ten estuarine systems scattered from Louisiana to Mexico. The legislature is expected to make some basic policy decisions concerning the estuarine resources. Agriculture, in contrast to manufacturing and most other uses, consumes a large part of its water withdrawals. The development of Texas has exacted a high price in the deteriorating quality of its water resources. Rivers, lakes, and coastal waters have been heavily damaged by the discharge of waste, by polluted runoff from urban, agricultural, and resource development, and by accelerated erosion and sedimentation. A strategy to achieve cleaner waters and reduce the production of unnecessary pollutants is now under way. (Humphreys-ISWS)

WATER RESOURCES DATA FOR OKLAHOMA, WATER YEAR 1978--VOLUME 1. ARKANSAS RIVER BASIN.
Geological Survey, Oklahoma City, OK. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-143829, Price codes: A23 in paper copy, A01 in microfiche. Geological Survey Water-Data Report OK-78-1, September 1979. 523 p, 8 Fig.

Descriptors: *Oklahoma, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Arkansas River basin.

Water resources data for the 1978 water year for Oklahoma consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes or reservoirs. Volumes 1 and 2 of this report contain discharge records for 120 gaging stations; stage and contents for 27 lakes or reservoirs; water quality for 121 gaging stations, 3 lakes, and 76 wells; and water levels for 48 wells. Also included are 42 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Oklahoma. (Kosco-USGS)

A data management system was developed to store and retrieve urban stormwater data collected from four small urban basins in south Florida. The system is event oriented in that all data from one storm are stored together on the computer file. The data include descriptive information about the storm and data on rainfall, stage, discharge, and water quality. The data management system, composed of about 20 Fortran programs, was developed to store data, retrieve tables for publication, calculate flow discharges and constituent loads, and provide for interfacing with statistical and deterministic model application programs. GEOHYDROLOGIC DATA FOR THE BEAVER-PASQUISET GROUND-WATER RESERVOIR, RHODE ISLAND,
Geological Survey, Providence, RI. Water Resources Div.
D. C. Dickerman, and H. E. Johnston.
Rhode Island Water Resources Board Water Information Series Report 3, 1977. 128 p, 18 Fig, 1 Plate, 21 Tab, 13 Ref.

Descriptors: *Hydrologic data, *Rhode Island, *Groundwater resources, *Data collections, Sites, Aquifer characteristics, Stratigraphy, Planning, Water resources development, Water levels, Water yield, Test wells, Lithologic logs, Particle size, Sampling, Water analysis, Seismology, Resistivity, Surface waters, Water quality, Low flow, Discharge measurement, Chemical analysis, Pumping, Observation wells, *Beaver-Pasquiset groundwater reservoir, *Pawcatuck River basin, Charlestown moraine, Stratified-drift deposits.

Geohydrologic data were collected in a 16.9 square-mile study area in southern Rhode Island, which includes the Beaver-Pasquiset ground-water reservoir. The data, which are mainly limited to the stratified-drift aquifer, are presented in tabular form and are being used by the Rhode Island Water Resources Board in planning and developing the ground-water resources of the Pawcatuck River basin in southern Rhode Island. The data include descriptions of the depths, yields, and construction features of 230 selected wells and test holes; lithologic logs of 110 wells and test holes; particle-size distribution for 300 lithologic samples; description of 8 aquifer tests; velocity and layer thickness at 41 seismic shot points; apparent resistivity at 9 sites; water-level data; surface-water-quality data; low-flow discharge measurements; and stream discharge data. Chemical analyses of water samples from 69 selected wells and test holes are also included. The location of data-collection sites and the area underlain by stratified-drift deposits are shown on a two-part plate on a 1:12,000 scale topographic base map. Figures show the location of aquifer test sites, pumping wells, observation wells, and generalized lithologic logs of wells. (Kosco-USGS)

W80-03972 6E

AERIAL PHOTOGRAPHY
Non-Point Source Sedimentation Studies Using Infrared Remote Sensing,
W80-03923 5B

AFRICA
Zooplankton in an Upwelling Area Off Northwest Africa: Composition, Distribution and Ecology,
W80-04113 5C

AGRICULTURAL RUNOFF
Planning for Nonpoint Pollution Control in North Carolina,
W80-04130 5B

Uptake and Release of Nutrients by Aquatic Macrophytes,
W80-04136 5C

AGRICULTURAL WATERSHEDS
Non-Point Source Pollution from Abandoned Agricultural Land in the Great Lakes Basin,
W80-04052 5B

Phosphorus Loading Associated with Housing in a Rural Watershed,
W80-04055 5B

AIR POLLUTION
The Environmental Transport of Lead and Cadmium,
W80-03914 5B

Offenses Against the Environment and Their Prevention: An International Appraisal,
W80-03977 6E

ALAMOGORDO CREEK (NM)
Dense Networks to Measure Convective Rainfall in the Southwestern United States,
W80-03943 7A

ALBERTA (CANADA)
Rainfall Measurements by Weather Radar: Applications to Hydrology,
W80-03929 7B

ALGAE
Numerical Abundance and Biomass of Bacteria, Algae and Macrobenthos of a Large Northern River, the Athabasca,
W80-04127 5C

Primary Production of Algae Growing on Natural and Artificial Aquatic Plants: A Study of Interactions Between Epiphytes and Their Substrate,
W80-04131 2I

ALGAL CONTROL
Growth and Population Studies on Tilapia Galilaea in Lake Kinneret,
W80-04152 5G

ALKALINITY
Spatial and Temporal Patterns of Temperature, Alkalinity, Dissolved Oxygen and Conductivity in an Oligo-Mesotrophic, Deep-Storage Reservoir in Central Texas,
W80-04135 5C

ALTERNATIVE PLANNING
Environmental Alternatives and Social Goals,
W80-04157 6E

ALUMINUM
Elemental Content of Aquatic Organisms Inhabiting a Pond Contaminated with Coal Fly Ash,
W80-04011 5B

ANAEROBIC CONDITIONS
Some Biochemical Constituents of Stage I and II Nauplii of Balanus Balanoides (L.) and the Effect of Anoxia on Stage I,
W80-04005 5C

ANAESTHETICS
Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Haemoglobin Electrophoresis, ATP Levels and Corpuscular Fragility Curves,
W80-03988 5A

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Intraspecies Differences,
W80-03989 5C

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Interspecies Differences,
W80-03990 5C

ANALYSIS
Interactive Pollutants and Joint Abatement Costs: Achieving Water Quality Standards with Effluent Charges,
W80-04187 5G

ANALYTICAL TECHNIQUES
Analytical Method for Nonionic Surfactants in Laboratory Biodegradation and Environmental Studies,
W80-03976 5A

ANIMAL BEHAVIOR
Consumer Regulation of Nutrient Cycling,
W80-04122 5B

ANIMAL PHYSIOLOGY
On the Resistance of Isolated Bivalve Gill Pieces to Oxygen Deficiency and Hydrogen Sulphide,
W80-04009 5C

ANOMALOCARDIA
On the Resistance of Isolated Bivalve Gill Pieces to Oxygen Deficiency and Hydrogen Sulphide,
W80-04009 5C

AQUATIC BACTERIA
Kinetics of Accumulation of Some Radionuclides by Marine Bacteria,
W80-03997 5A

Immune Response to Bacterial Immunization of Channel Catfish Maintained in a Recirculating Water-Reuse System,
W80-04016 5C

Seasonal Changes in Structure of a Submerged Bluegreen Algal/Bacterial Community from a Geothermal Hostspring,
W80-04117 5C

AQUATIC LIFE
Effects of Nonsettleable Biosolids on Stream Organisms,
W80-03991 5C

Elemental Content of Aquatic Organisms Inhabiting a Pond Contaminated with Coal Fly Ash,
W80-04011 5B

AQUATIC PLANTS
DDT-Induced Changes in the Activity of the Photosynthetic System of Aquatic Plants,
W80-03998 5C

Uptake and Release of Nutrients by Aquatic Macrophytes,
W80-04136 5C

Growth, Chlorophyll and Mineral Nutrient Studies on Phalaris Arundinaceae L. in Three Scottish Lochs,
W80-04147 5C

Distribution and Quantitative Development of Aquatic Macrophytes in Relation to Sediment Characteristics in Oligotrophic Lake Kalgaard, Denmark,
W80-04172 5C

AQUATIC WEED CONTROL
Keep Recreational Waters Algae-Free,
W80-04116 5G

AQUEDUCTS
Comprehensive Monitoring of Meteorology, Hydraulics, and Thermal Regime of the San Diego Aqueduct, California,
W80-04100 2D

AQUIFER CHARACTERISTICS
Ground Water Interactions with Wetlands,
W80-03926 2A

Geology and Groundwater Resources of Monroe County, Pennsylvania,
W80-04095 2F

AQUIFERS
Stochastic Analysis of Macrodispersion in a Stratified Aquifer,
W80-03928 2F

Determination of Recharge Rates Using Temperature-Depth Profiles in Wells,
W80-03946 2F

Thermal Energy Storage in a Confined Aquifer: Experimental Results,
W80-03952 2F

ARIZONA
Dense Networks to Measure Convective Rainfall in the Southwestern United States,
W80-03943 7A

Termination of Hydrologic Data Collection (A Case Study),
W80-04049 6B

ARKANSAS RIVER
Recreation at the McClellan-Kerr Arkansas River Navigation System,
W80-04153 6B

ARKANSAS RIVER BASIN
Water Resources Data for Oklahoma, Water Year 1978--Volume 1. Arkansas River Basin.
W80-04083 7C

ARKANSAS RIVER (CO)
In Situ Measurements of Net Primary Production in a Colorado Mountain Stream,
W80-04140 5C

ARSENIC
Elemental Content of Aquatic Organisms Inhabiting a Pond Contaminated with Coal Fly Ash,
W80-04011 5B

ARTHROBACTER
Degradation of the Crude Oil by Arthrobacter Sp. (In Japanese),
W80-04002 5A

ARTIFICIAL RECHARGE
Effect of Infiltration Rate on Biological Clogging and Water Quality Changes During Artificial Recharge,
W80-03950 4B

ARTIFICIAL SUBSTRATES
Primary Production of Algae Growing on Natural and Artificial Aquatic Plants: A Study of Interactions Between Epiphytes and Their Substrate,
W80-04131 2I

ATHABASCA RIVER (ALBERTA
Numerical Abundance and Biomass of Bacteria, Algae and Macrobenthos of a Large Northern River, the Athabasca,
W80-04127 5C

ATLANTIC COASTAL PLAIN
Origins of Oceanic Plankton in the Middle Atlantic Blight,
W80-04132 2L

AVAILABLE WATER
Water Resources of the Lower Elwha Indian Reservation, Washington,
W80-04086 2F

AYU
Studies on Chemotherapy of Fish Diseases with Piromidic Acid--I. Absorption, Distribution, Excretion and Toxicity of Piromidic Acid in Some Species of Fishes,
W80-04012 5B

BACTERIA
Relationships Between Bacterial Populations and Oxygen Levels in the Central Basin of Lake Erie,
W80-04059 2H

Numerical Abundance and Biomass of Bacteria, Algae and Macrobenthos of a Large Northern River, the Athabasca,
W80-04127 5C

Phosphatase Activity and Its Role in the Mineralization of Organic Phosphorus in Coastal Sea Water,
W80-04141 5F

Primary Production and Bacterioplankton in Fish Ponds with Mono and Poly-Culture,
W80-04148 5C

BACTERIAL IMMUNIZATION
Immune Response to Bacterial Immunization of Channel Catfish Maintained in a Recirculating Water-Reuse System,
W80-04016 5C

BARNACLES
Some Biochemical Constituents of Stage I and II Nauplii of Balanus Balanoides (L.) and the Effect of Anoxia on Stage I,
W80-04005 5C

BARNSTABLE HARBOR (MA)
A Diatom Assemblage Living Below the Surface of Intertidal Sand Flats,
W80-04143 2L

BASE FLOW
Interactions of Mining and Water Resource Systems in the Southeastern Idaho Phosphate Field,
W80-04104 2F

BASELINE STUDIES
Baseline Study of the Level of Concentration of Mercury in the Food Fishes of Bay of Bengal, Arabian Sea and Indian Ocean,
W80-03999 5A

Eastern Gulf of Mexico Marine Habitat Study. Volume I.
W80-04076 5B

Eastern Gulf of Mexico Marine Habitat Study. Volume II: Maps and Cross Sections.
W80-04077 5B

The Mississippi, Alabama, Florida, Outer Continental Shelf Baseline Environmental Survey - MAFLA 1977/1978. Volume 1-B. Executive Summary Report.
W80-04196 5C

OTEC Physical and Climatic Environmental Impacts: An Overview of Modeling Efforts and Needs,
W80-04197 5C

BASS LAKE (WISC)
Hydrogeology and Computer Model of the Bass Lake Area, St. Croix County, Wisconsin,
W80-04111 2H

BAY OF BENGAL
Baseline Study of the Level of Concentration of Mercury in the Food Fishes of Bay of Bengal, Arabian Sea and Indian Ocean,
W80-03999 5A

BAY OF FUNDY
Wave-Induced Liquefaction: A Modern Example from the Bay of Fundy,
W80-04061 2L

BAYS
Preliminary Observations on the Benthic Macroinvertebrate Communities of Ross Bay, A Polluted Area of Lough Leane, South-West Ireland,
W80-03934 5B

Applying Phosphorus Loading Models to Embayments,
W80-04123 5B

Phosphatase Activity and Its Role in the Mineralization of Organic Phosphorus in Coastal Sea Water,
W80-04141 5F

BEAVER-PASQUISET GROUND-WATER RESERVOIR
Geohydrologic Data for the Beaver-Pasquiset Ground-Water Reservoir, Rhode Island,
W80-04098 7C

BENEFITS
On the Cost-Benefit Analysis of Port Projects,
W80-04160 6B

BENTHIC FAUNA
Sediment Mixing by Lampsilis Radiata Siliquoidea (Mollusca) from Western Lake Erie,
W80-04053 2J

BENTHIC FLORA
Epipelic and Epilithic Diatom Assemblages in Montezuma Well National Monument, Arizona,
W80-04133 5C

BENTHOS
Preliminary Observations on the Benthic Macroinvertebrate Communities of Ross Bay, A Polluted Area of Lough Leane, South-West Ireland,
W80-03934 5B

Numerical Abundance and Biomass of Bacteria, Algae and Macrobenthos of a Large Northern River, the Athabasca,
W80-04127 5C

BILLS
Heat Resistance of Cells of Upper Sublittoral Bivalve Mollusks of Sandy Infauna in Peter the Great Bay (Sea of Japan),
W80-03983 5C

BIOACCUMULATION
Kinetics of Accumulation of Some Radionuclides by Marine Bacteria,
W80-03997 5A

Roles of Food and Sea Water in the Accumulation of Radionuclides by Marine Fish,
W80-04000 5A

Accumulation and Excretion of Cobalt-60 Taken Up from Seawater by Marine Fishes,
W80-04001 5A

Mercury Interaction in Crayfish Antennal Gland and Hepatopancreas,
W80-04006 5B

Mercury Contents of Zooplankton Collected in the Tropical Pacific Ocean,
W80-04007 5A

Elemental Content of Aquatic Organisms Inhabiting a Pond Contaminated with Coal Fly Ash,
W80-04011 5B

BIOCHEMISTRY
Chelation of Divalent Metal Ions by Brown Algal Polyphenols,
W80-03987 2C

Changes in Biochemistry of Some Aquatic Organisms of the Barents Sea Coast in Experimental Oil Intoxication,
W80-03996 5A

Photosynthetic Carboxylating Enzymes in Marine Phytoplankton,
W80-04146 5C

BIODEGRADATION
Analytical Method for Nonionic Surfactants in Laboratory Biodegradation and Environmental Studies,
W80-03976 5A

BIOINDICATORS
Phosphorus Loading Associated with Housing in a Rural Watershed,
W80-04055 5B

BIOLOGICAL COMMUNITIES
Preliminary Observations on the Benthic Macroinvertebrate Communities of Ross Bay, A Polluted Area of Lough Leane, South-West Ireland,
W80-03934 5B

The Potential Effects of Energy Related Activities on the Seasonal Trajectories of Epiphytic Marine Diatoms,
W80-04125 5C

Epipelic and Epilithic Diatom Assemblages in Montezuma Well National Monument, Arizona,
W80-04133 5C

BIOLOGICAL EFFECTS
Biological Observations,
W80-04081 5C

BIOLOGY
Effects of Landfill Leaching on Water Quality and Biology of a Nearby Stream, South Cairo, Greene County, New York,
W80-04092 5B

BIOMASS
Features of the Structure and Trophic Links of Planktonic Associations in Two Lakes With Different Degress of Salinity,
W80-03963 5C

Ichthyoplankton of the St. Lawrence Estuary: Composition, Distribution, and Abundance,
W80-03965 2H

Distribution and Aspects of the Production and Biomass of Eelgras, Zostera Marina L., at Roscoff, France,
W80-04137 2I

BLANEY CRIDDLE EQUATION
Consumptive Use and Yields of Crops in New Mexico,
W80-04107 2D

BLANEY-CRIDDLE FORMULA
Urban Lawn Evapotranspiration--Measurement and Prediction,
W80-04021 2D

BLOOD CHEMISTRY
Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Haemoglobin Electrophoresis, ATP Levels and Corpuscular Fragility Curves,
W80-03988 5A

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Intraspecies Differences,
W80-03989 5C

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Interspecies Differences,
W80-03990 5C

BOUNDARY DISPUTES
The Optimal Management of Transboundary Renewable Resources,
W80-03970 6B

BRAZIL
On the Resistance of Isolated Bivalve Gill Pieces to Oxygen Deficiency and Hydrogen Sulphide,
W80-04009 5C

BREAKTHROUGH CURVES
Modeling Groundwater Flow Fields Containing Point Singularities: Streamlines, Travel Times, and Breakthrough Curves,
W80-03956 2F

BRINE SHRIMP
Changes in the Physiological Processes of Aquatic Organisms Under the Influence of a Constant Magnetic Field,
W80-03995 5A

BRITISH COLUMBIA
Development of Hydrometric Networks in British Columbia,
W80-03944 7A

BUFFERS
Mechanisms of Regulation of the Acid-Base Balance in Fish as They Adapt to Carbon Dioxide Levels in an Aqueous Environment,
W80-03994 5A

BULK DENSITY
Estimating Soil Water Retention Characteristics from Particle Size Distribution, Organic Matter Percent, and Bulk Density,
W80-04038 2G

BUOYANCY
Buoyancy of Natural Populations of Marine Phytoplankton,
W80-04139 5C

CADMIUM
The Environmental Transport of Lead and Cadmium,
W80-03914 5B

Heavy Metal Tolerance of Marine Phytoplankton. IV. Combined Effect of Zinc and Cadmium on Growth and Uptake in Some Marine Diatoms,
W80-03982 5A

CALCIUM RADIOISOTOPES
Kinetics of Accumulation of Some Radionuclides by Marine Bacteria,
W80-03997 5A

CALIFORNIA
Climatological Estimate of the Average Monthly Energy and Water Budgets of Lake Tahoe, California-Nevada,
W80-03953 2H

Comprehensive Monitoring of Meteorology, Hydraulics, and Thermal Regime of the San Diego Aqueduct, California,
W80-04100 2D

Thermal Modeling of Flow in the San Diego Aqueduct, California, and Its Relation to Evaporation,
W80-04102 2D

The 1976-1977 California Drought--A Review,
W80-04189 2E

CANADA
Development of Hydrometric Networks in British Columbia,
W80-03944 7A

Triazine Residues in Suspended Solids (1974-1976) and Water (1977) from the Mouths of Canadian Streams Flowing Into the Great Lakes,
W80-04056 5A

Application of Short-Time Scale Recording Meter Data to Numerical Modelling of Toronto Harbour,
W80-04057 5B

Newfoundland's Claim to Offshore Mineral Resources: An Overview of the Legal Issues,
W80-04150 6E

The Ecosystem Approach; Scope and Implications of an Ecosystem Approach to Transboundary Problems in the Great Lakes Basin.
W80-04159 6E

CANALS
Thermal Modeling of Flow in the San Diego Aqueduct, California, and Its Relation to Evaporation,
W80-04102 2D

CANYON LAKE (TX)
Spatial and Temporal Patterns of Temperature, Alkalinity, Dissolved Oxygen and Conductivity in an Oligo-Mesotrophic, Deep-Storage Reservoir in Central Texas,
W80-04135 5C

CAPITAL COSTS
Capital Cost Functions of a Surface Water Treatment Plant and its Components,
W80-04161 6C

CARBON
Organic Carbon Cycling in a Swamp-Stream Ecosystem and Export by Streams in Eastern North Carolina,
W80-03906 5C

Organic Carbon Export from Upland and Forested Wetland Watersheds,
W80-03925 5B

CARBON DIOXIDE
Mechanisms of Regulation of the Acid-Base Balance in Fish as They Adapt to Carbon Dioxide Levels in an Aqueous Environment,
W80-03994 5A

Some Photosynthetic Carbon Fixation Properties of Seagrasses,
W80-04129 5C

CARBONATES
Some Photosynthetic Carbon Fixation Properties of Seagrasses,
W80-04129 5C

CARP
Mechanisms of Regulation of the Acid-Base Balance in Fish as They Adapt to Carbon Dioxide Levels in an Aqueous Environment,
W80-03994 5A

CASE STUDY
A Case Study of Rationalization of a Rain Gage Network in Southwest England,
W80-04046 2B

CATION EXCHANGE
Functional Polymers for Removal of Heavy-Metal Pollutants from Water,
W80-03911 5D

CERATOPHYLLUM
DDT-Induced Changes in the Activity of the Photosynthetic System of Aquatic Plants,
W80-03998 5C

CHANNEL CATFISH
Maximum Utilization of Water Resources in a Planned Community: Chlorine and Ozone Toxicity Evaluation,
W80-03921 5C

Immune Response to Bacterial Immunization of Channel Catfish Maintained in a Recirculating Water-Reuse System,
W80-04016 5C

CHELATION
Functional Polymers for Removal of Heavy-Metal Pollutants from Water,
W80-03911 5D

Chelation of Divalent Metal Ions by Brown Algal Polyphenols,
W80-03987 2C

CHEMICAL ANALYSIS
Volatile Chloro- and Chlorofluorocarbons in Lake Erie--1977 and 1978,
W80-04058 5A

Chemical Composition of Selected Environmental and Petroleum Samples from the Amoco Cadiz Oil Spill,
W80-04079 5C

Growth, Chlorophyll and Mineral Nutrient Studies on Phalaris Arundinaceae L. in Three Scottish Lochs,
W80-04147 5C

CHEMICAL PROPERTIES
Chemistry of Water Milfoil Tissue: Seasonal Variation in Submersed Apices,
W80-03910 5A

Studies on Chemotherapy of Fish Diseases with Piromidic Acid--I. Absorption, Distribution, Excretion and Toxicity of Piromidic Acid in Some Species of Fishes,
W80-04012 5B

CHLORELLA
The Uptake of Urea by Chlorella,
W80-04124 5C

CHLORINATION
Maximum Utilization of Water Resources in a Planned Community: Chlorine and Ozone Toxicity Evaluation,
W80-03921 5C

CHLOROPHYLL
Growth, Chlorophyll and Mineral Nutrient Studies on Phalaris Arundinaceae L. in Three Scottish Lochs,
W80-04147 5C

CHROMIUM
Elemental Content of Aquatic Organisms Inhabiting a Pond Contaminated with Coal Fly Ash,
W80-04011 5B

CLEANING
Oil Spill Cleanup Activities,
W80-04082 5C

CLEAR-CUTTING
Effects of Clearcutting on Soil Water Depletion in an Engelmann Spruce Stand,
W80-04034 4A

CLIMATIC DATA
Measurements of Rainfall Intensity, Instrumentation and Data Processing,
W80-04028 2B

CLOGGING
Effect of Infiltration Rate on Biological Clogging and Water Quality Changes During Artificial Recharge,
W80-03950 4B

COAL FLY ASH
Elemental Content of Aquatic Organisms Inhabiting a Pond Contaminated with Coal Fly Ash,
W80-04011 5B

COALS
Quality and Treatment of Water Involved with Coal Slurry Transport by Pipeline,
W80-04108 5D

COBALT RADIOISOTOPES
Accumulation and Excretion of Cobalt-60 Taken Up from Seawater by Marine Fishes,
W80-04001 5A

COBEQUID BAY (NOVA SCOTIA)
Wave-Induced Liquefaction: A Modern Example from the Bay of Fundy,
W80-04061 2L

CODORUS CREEK (PA)
The Codorus Creek Wastewater Management Study--Analysis of Conclusions: Summary of Findings and Recommendations,
W80-04171 5G

The Codorus Creek Wastewater Management Study--Appendix A. Technical Studies. Vol. I,
W80-04173 5G

The Codorus Creek Wastewater Management Study--Appendix A. Technical Studies. Vol. II,
W80-04174 5G

The Codorus Creek Wastewater Management Study--Appendix A. Technical Studies. Vol. III,

The Codorus Creek Wastewater Management Study--Appendix A. Technical Studies. Vol. IV,
W80-04176 5G

The Codorus Creek Wastewater Management Study. Appendix B. Impact Studies,
W80-04177 5G

The Codorus Creek Wastewater Management Study. Appendix C. Analysis of Institutional Arrangements,
W80-04178 5G

The Codorus Creek Wastewater Management Study. Supplement to Appendix C. Implementing a Land-Based System--An Analysis of Approaches,
W80-04179 5G

COLORADO
Optimal Water Use and Salinity Control for Energy--Upper Colorado River Basin,
W80-04190 6A

COMBINED SEWER OVERFLOWS
Benefit Analysis for Combined Sewer Overflow Control,
W80-04165 5D

COMBINED SEWERS
Benefit Analysis for Combined Sewer Overflow Control,
W80-04165 5D

COMMERCIAL FISH
Immune Response to Bacterial Immunization of Channel Catfish Maintained in a Recirculating Water-Reuse System,
W80-04016 5C

COMPARATIVE COSTS
Demineralization of Brackish Municipal Water Supplies--Comparative Costs,
W80-03978 6B

COMPARATIVE PRODUCTIVITY
Extent and Nature of Thermal Stress on Copepod Populations,
W80-04014 5C

COMPUTER MODELS
Dynamic Water Management: An Optimal Control Approach,
W80-03905 6C

Optimal Allocation of Water Resources in An Input-Output Framework: User's Manual,
W80-03915 6A

Urban Stormwater Data Management System with Applications to South Florida Studies,
W80-04097 7C

CONDUCTIVITY
Spatial and Temporal Patterns of Temperature, Alkalinity, Dissolved Oxygen and Conductivity in an Oligo-Mesotrophic, Deep-Storage Reservoir in Central Texas,
W80-04135 5C

CONSUMPTIVE USE
Consumptive Use and Yields of Crops in New Mexico,
W80-04107 2D

CONTINENTAL SHELF
Zooplankton in an Upwelling Area Off Northwest Africa: Composition, Distribution and Ecology,
W80-04113 5C

Newfoundland's Claim to Offshore Mineral Resources: An Overview of the Legal Issues,
W80-04150 6E

CONTINENTAL SLOPE
Zooplankton in an Upwelling Area Off Northwest Africa: Composition, Distribution and Ecology,
W80-04113 5C

CONTROL
Benefit Analysis for Combined Sewer Overflow Control,
W80-04165 5D

COPEPODS
Extent and Nature of Thermal Stress on Copepod Populations,
W80-04014 5C

COPPER
The Effect of Dissolved Copper on the Increase in Length of Four Species of Intertidal Fucoid Algae,
W80-03992 5A

Elemental Content of Aquatic Organisms Inhabiting a Pond Contaminated with Coal Fly Ash,
W80-04011 5B

CORMORANTS
DDE-Contaminated Fish Off Los Angeles Are Suspected Cause in Deaths of Captive Marine Birds,
W80-03986 5C

CORRELATION ANALYSIS
Characterization of the Water Quality in the Saint Lawrence River: Determination of Homogeneous Zones by Correspondence Analysis,
W80-03955 5A

Effect of Periodic Parameters on the Autocorrelation Structure of Hydrologic Series,
W80-04039 2E

Spatial Variability of Infiltration in a Watershed,
W80-04062 2G

Possible Relation Between Phytoplankton Numbers and Saprolegnioid Fungi in Shatt Al-Arab Near Basrah, Iraq,
W80-04119 5F

Epipelic and Epilithic Diatom Assemblages in Montezuma Well National Monument, Arizona,
W80-04133 5C

COST ANALYSIS
Least Cost Solutions to the Problem of Effluent Abatement in Urban Systems,
W80-04154 5D

Technical and Economic Evaluation of an MSF Solar Energy Powered Desalination Plant,
W80-04155 3A

Cost Behavior and Water Systems,
W80-04156 6C

COST-BENEFIT ANALYSIS
The Costs and Benefits of Water Metering,
W80-03974 6B

On the Cost-Benefit Analysis of Port Projects,
W80-04160 6B

Benefit Analysis for Combined Sewer Overflow Control.
W80-04165 5D

COSTS
Optimized Economic Use of Sludge Treatment Facilities in Durban,
W80-03979 5B

CRABS
Long-Term Effects of Water-Soluble Fractions of Kuwait Crude Oil on the Larval and Juvenile Development of the Mud Crab Eurypanopeus Depressus,
W80-04004 5A

CRAYFISH
Mercury Interaction in Crayfish Antennal Gland and Hepatopancreas,
W80-04006 5B

CREEPING SWAMP (NC)
Phosphorus Cycling in the Creeping Swamp Floodplain Ecosystem and Exports from the Creeping Swamp Watershed,
W80-03907 5B

CROP PRODUCTION
Consumptive Use and Yields of Crops in New Mexico,
W80-04107 2D

CRUDE OIL
Degradation of the Crude Oil by Arthrobacter Sp. (In Japanese),
W80-04002 5A

Long-Term Effects of Water-Soluble Fractions of Kuwait Crude Oil on the Larval and Juvenile Development of the Mud Crab Eurypanopeus Depressus,
W80-04004 5A

CRUSTACEANS
Seasonal Variation in the Populations of Moina Macrocopa Strauss and Moina Micrura Kurz (Crustacea: Cladocera) in Zoafaraniyah Pools,
W80-04121 5B

CULTURES
Production of Vitamin B12, Thiamine, and Biotin by Freshwater Phytoplankton,
W80-04169 2H

CURRENTS (WATER)
Origins of Oceanic Plankton in the Middle Atlantic Blight,
W80-04132 2L

CYANOPHYTA
Seasonal Changes in Structure of a Submerged Bluegreen Algal/Bacterial Community from a Geothermal Hostspring,
W80-04117 5C

Volatile Organic Sulfides from Freshwater Algae,
W80-04128 5C

CYCLING NUTRIENTS
Consumer Regulation of Nutrient Cycling,
W80-04122 5B

Applying Phosphorus Loading Models to Embayments,
W80-04123 5B

Uptake and Release of Nutrients by Aquatic Macrophytes,
W80-04136 5C

Phosphatase Activity and Its Role in the Mineralization of Organic Phosphorus in Coastal Sea Water,
W80-04141 5F

DAMS
Hydrogeology and Computer Model of the Bass Lake Area, St. Croix County, Wisconsin,
W80-04111 2H

DAPHNIA
Acute Toxicity of Some Experimental Road Surfacing Compounds to Daphnia Pulex,
W80-04003 5C

DATA COLLECTIONS
An Optimal Sampling Procedure for the Collection of Residential Water Use Data,
W80-03931 6D

The Worth of Streamflow Data in Water Resources Planning: Computational Results,
W80-04019 2E

Hydrologic Data from Selected Wells in the Helena Valley, Lewis and Clark County, Montana,
W80-04090 2F

Geohydrologic Data for the Beaver-Pasquiset Ground-Water Reservoir, Rhode Island,
W80-04098 7C

DATA STORAGE AND RETRIEVAL
The Development of Palis: A Ponds and Lakes Information System for Massachusetts,
W80-03902 6A

Measurements of Rainfall Intensity, Instrumentation and Data Processing,
W80-04028 2B

Multidate Landsat Lake Quality Monitoring Program,
W80-04118 7B

DDE
DDE-Contaminated Fish Off Los Angeles Are Suspected Cause in Deaths of Captive Marine Birds,
W80-03986 5C

DDT
DDE-Contaminated Fish Off Los Angeles Are Suspected Cause in Deaths of Captive Marine Birds,
W80-03986 5C

DDT-Induced Changes in the Activity of the Photosynthetic System of Aquatic Plants,
W80-03998 5C

DECISION MAKING
The Worth of Hydrologic Data for Nonoptimal Decision Making,
W80-04044 6B

Termination of Hydrologic Data Collection (A Case Study),
W80-04049 6B

A Statistical Approach to Station Discontinuance,
W80-04050 2E

Some Policy Implications of Water Development,

A Diatom Assemblage Living Below the Surface of Intertidal Sand Flats,
W80-04143 2L

DIFFUSION
A Note on Diffusion from a Continuous Line Source in a Time Varying Flow,
W80-04037 5B

DIMETHYL SULFIDE
Volatile Organic Sulfides from Freshwater Algae,
W80-04128 5C

DISASTERS
A Chance-Constrained Goal Programming Model to Evaluate Response Resources for Marine Pollution Disasters,
W80-04164 6A

DISCHARGE
Ground Water Interactions with Wetlands,
W80-03926 2A

DISCHARGE (WATER)
Dumanli Spring, Turkey--The Largest Karstic Spring in the World,
W80-04029 2F

The Linear Reservoir with Markovian Inflows,
W80-04035 2H

DISEASE
Human Viruses in the Aquatic Environment: A Status Report with Emphasis on the EPA Research Program.
W80-03922 5A

DISEASES
Domestic Water Supplies, Health and Poverty: A Brief Review,
W80-04183 6D

DISECONOMIES OF SCALE
Capital Cost Functions of a Surface Water Treatment Plant and its Components,
W80-04161 6C

DISPERSION
Stochastic Analysis of Macrodispersion in a Stratified Aquifer,
W80-03928 2F

Analytical Solution of a Velocity Dependent Dispersion Problem,
W80-04030 5B

DISSOLVED OXYGEN
Use of Hypolimnetic Oxygen Depletion Rate as a Trophic State Index for Lakes,
W80-03954 2H

Relationships Between Bacterial Populations and Oxygen Levels in the Central Basin of Lake Erie,
W80-04059 2H

Spatial and Temporal Patterns of Temperature, Alkalinity, Dissolved Oxygen and Conductivity in an Oligo-Mesotrophic, Deep-Storage Reservoir in Central Texas,
W80-04135 5C

DISTRIBUTION
Ichthyoplankton of the St. Lawrence Estuary: Composition, Distribution, and Abundance,
W80-03965 2H

Distribution and Quantitative Development of Aquatic Macrophytes in Relation to Sediment Characteristics in Oligotrophic Lake Kalgaard, Denmark,
W80-04172 5C

DIVERSION
Impact of Waste Diversion on Water Quality in Lakes,
W80-04144 3C

DNA
Changes in Biochemistry of Some Aquatic Organisms of the Barents Sea Coast in Experimental Oil Intoxication,
W80-03996 5A

DOMESTIC WASTES
Phosphorus Loading Associated with Housing in a Rural Watershed,
W80-04055 5B

Evaluation of Mound Systems for Purification of Septic Tank Effluent,
W80-04112 5D

DOMESTIC WATER
The Costs and Benefits of Water Metering,
W80-03974 6B

Domestic Water Supplies, Health and Poverty: A Brief Review,
W80-04183 6D

DRAINAGE
Organic Carbon Export from Upland and Forested Wetland Watersheds,
W80-03925 5B

Impact of Road Networks on Southeastern Michigan Lakeshore Drainage,
W80-03951 2E

DRAINAGE PROGRAMS
Post-War Land Drainage, Fertilizer Use and Environmental Impact in Northern Ireland,
W80-04115 4A

DREDGED MATERIAL
Depositional Characteristics of Sediments at a Low Energy Ocean Disposal Site, Savannah, Georgia,
W80-04067 5

DREDGING
Shelf-Sediment Dynamics and Solid-Waste Disposal,
W80-04063 5C

Waste Disposal and Dredging Activities: The Geological Perspective,
W80-04064 5C

Dredging and Disposal in Chesapeake Bay, 1975-2025,
W80-04070 5C

The Problem of Misplaced Sediment,
W80-04071 5C

Dredged Material, Ocean Disposal, and the Regulatory Maze,
W80-04075 5C

DROUGHTS
The 1976-1977 California Drought--A Review,

FEDERAL PROJECT POLICY
The Pyramid Lake-Newlands Project Controversy, 1903-1926,
W80-03917 6B

FEDERAL-STATE WATER RIGHTS CONFLICTS
Newfoundland's Claim to Offshore Mineral Resources: An Overview of the Legal Issues,
W80-04150 6E

FEDERAL WATER POLLUTION CONTROL ACT
Liability Without Fault Under the Federal Water Pollution Control Act,
W80-03971 6E

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972
Planning for Nonpoint Pollution Control in North Carolina,
W80-04130 5B

FERTILIZATION
Addition of Nutrients to a Lake Leads to Greatly Increased Catch of Salmon,
W80-04114 5C

Post-War Land Drainage, Fertilizer Use and Environmental Impact in Northern Ireland,
W80-04115 4A

FERTILIZERS
Construction and Application of a Water Quality Model for the Upper Blackfoot River Basin in the Caribou National Forest, Idaho,
W80-04105 6A

FIELD MEASUREMENTS
Field Measurement of Soil Hydraulic Properties Characterizing Water Movement Through Swelling Clay Soils,
W80-03935 2G

FILTRATION
Selection and Use of Polymers in Contact Filtration,
W80-04018 5F

FINITE ELEMENT ANALYSIS
Groundwater Basin Modeling Using the Finite Element Method - Yolo County Case Study,
W80-03904 6A

FISH ANAESTHETICS
Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Haemoglobin Electrophoresis, ATP Levels and Corpuscular Fragility Curves,
W80-03988 5A

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Intraspecies Differences,
W80-03989 5C

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Interspecies Differences,
W80-03990 5C

FISH DISEASES
Studies on Chemotherapy of Fish Diseases with Piromidic Acid--I. Absorption, Distribution, Excretion and Toxicity of Piromidic Acid in Some Species of Fishes,
W80-04012 5B

FISH EGGS
Ichthyoplankton of the St. Lawrence Estuary: Composition, Distribution, and Abundance,
W80-03965 2H

FISH ESTABLISHMENT
Impact of an Introduced Fish Species (Morone Americana) on the Fisheries Resources of Nebraska,
W80-04109 5C

FISH FARM NIVKA (USSR)
Primary Production and Bacterioplankton in Fish Ponds with Mono and Poly-Culture,
W80-04148 5C

FISH FARMING
Addition of Nutrients to a Lake Leads to Greatly Increased Catch of Salmon,
W80-04114 5C

Primary Production and Bacterioplankton in Fish Ponds with Mono and Poly-Culture,
W80-04148 5C

FISH HARVEST
Addition of Nutrients to a Lake Leads to Greatly Increased Catch of Salmon,
W80-04114 5C

FISH MANAGEMENT
The Optimal Management of Transboundary Renewable Resources,
W80-03970 6B

Bioeconomic Model of the Gulf of Carpentaria Prawn Fishery,

MICROORGANISMS
Analysis of Heterotrophic Microplankton in an Upwelling Area,
W80-04145 5C

MIDDLE ATLANTIC BIGHT
Origins of Oceanic Plankton in the Middle Atlantic Blight,
W80-04132 2L

MIMBRES (NM)
Seasonal Changes in Structure of a Submerged Bluegreen Algal/Bacterial Community from a Geothermal Hostspring,
W80-04117 5C

MINE WASTES
Water Quality and Mining: A Management Plan.
W80-04180 5G

MINERAL LEVELS
Chemistry of Water Milfoil Tissue: Seasonal Variation in Submersed Apices,
W80-03910 5A

MINERALS
Chemistry of Water Milfoil Tissue: Seasonal Variation in Submersed Apices,
W80-03910 5A

MINING
Construction and Application of a Water Quality Model for the Upper Blackfoot River Basin in the Caribou National Forest, Idaho,
W80-04105 6A

Water Quality and Mining: A Management Plan.
W80-04180 5G

MIXING
Sediment Mixing by Lampsilis Radiata Siliquoidea (Mollusca) from Western Lake Erie,
W80-04053 2J

MODEL STUDIES
Stochastic Analysis of Macrodispersion in a Stratified Aquifer,
W80-03928 2F

Storm Travel Distance Calculations for Total Phosphorus and Suspended Materials in Rivers,
W80-03930 5B

A Planning Model for the Management of Groundwater Quality,
W80-03932 2F

Analytical Solutions for Predicting Solute Movement and Their Interpretation in Reclamation,
W80-03936 2G

Calculation of Water Balance in the Crop Root Zone by Computer,
W80-03937 2G

Considerations for the Design of a Hydrologic Data Network Using Multivariate Sensors,
W80-03941 7A

Soil Spatial Variability and Its Consequences on Simulated Water Balance,
W80-03947 2G

Stochastic Analysis of Steady State Groundwater Flow in a Bounded Domain, 2. Two-Dimensional Simulations,
W80-03949 2F

Discharge Response Analysis and Hydrologic Similarity: The Interrelation Between the Geomorphologic IUH and the Storm Characteristics,
W80-03957 2A

A Rainfall-Runoff Analysis of the Geomorphologic IUH,
W80-03958 2A

The Worth of Streamflow Data in Water Resources Planning: Computational Results,
W80-04019 2E

Consideration of Total Energy Loss in Theory of Flow to Wells,
W80-04022 2F

Application and Analysis of a Coupled Surface and Groundwater Model,
W80-04024 2E

Multiobjective Dynamic Programming with Application to a Reservoir,
W80-04025 4A

Multiobjective Dynamic Programming: A Classic Problem Redressed,
W80-04026 4A

Reliability-Constrained Reservoir Control Problems, 1. Methodological Issues,
W80-04031 2H

On the Problem of Discretization in Dam Theory,
W80-04033 2H

The Linear Reservoir with Markovian Inflows,
W80-04035 2H

A Note on Diffusion from a Continuous Line Source in a Time Varying Flow,
W80-04037 5B

Effect of Periodic Parameters on the Autocorrelation Structure of Hydrologic Series,
W80-04039 2E

Kriging in the Design of Streamflow Sampling Networks,
W80-04047 7A

Application of Short-Time Scale Recording Meter Data to Numerical Modelling of Toronto Harbour,
W80-04057 5B

Simulated Changes in Ground-Water Levels and Streamflow Resulting from Future Development (1970 to 2020) in the Platte River Basin, Nebraska,
W80-04096 6A

Urban Stormwater Data Management System with Applications to South Florida Studies,
W80-04097 7C

Thermal Modeling of Flow in the San Diego Aqueduct, California, and Its Relation to Evaporation,
W80-04102 2D

Applying Phosphorus Loading Models to Embayments,
W80-04123 5B

Phytoplankton Modeling Involving Random Rate Constants. Part I: Deterministic Setting,
W80-04151 5C

The Balance of Groundwater Resources of the European Community: A Methodology for a Multinational Problem,
W80-04182 4B

MODELS
OTEC Physical and Climatic Environmental Impacts: An Overview of Modeling Efforts and Needs,
W80-04197 5C

MOLLUSKS
Heat Resistance of Cells of Upper Sublittoral Bivalve Mollusks of Sandy Infauna in Peter the Great Bay (Sea of Japan),
W80-03983 5C

Some Biochemical Constituents of Stage I and II Nauplii of Balanus Balanoides (L.) and the Effect of Anoxia on Stage I,
W80-04005 5C

On the Resistance of Isolated Bivalve Gill Pieces to Oxygen Deficiency and Hydrogen Sulphide,
W80-04009 5C

Sediment Mixing by Lampsilis Radiata Siliquoidea (Mollusca) from Western Lake Erie,
W80-04053 2J

MONROE COUNTY (PA)
Geology and Groundwater Resources of Monroe County, Pennsylvania,
W80-04095 2F

MONTANA
Hydrologic Data from Selected Wells in the Helena Valley, Lewis and Clark County, Montana,
W80-04090 2F

MONTEZUMA WELL NATIONAL MONUMENT (AZ)
Epipelic and Epilithic Diatom Assemblages in Montezuma Well National Monument, Arizona,
W80-04133 5C

MORONE AMERICANA
Impact of an Introduced Fish Species (Morone Americana) on the Fisheries Resources of Nebraska,
W80-04109 5C

MORTALITY
DDE-Contaminated Fish Off Los Angeles Are Suspected Cause in Deaths of Captive Marine Birds,
W80-03986 5C

MOUND SYSTEMS
Evaluation of Mound Systems for Purification of Septic Tank Effluent,
W80-04112 5D

MOUNDS POND (WISC)
Hydrogeology and Computer Model of the Bass Lake Area, St. Croix County, Wisconsin,
W80-04111 2H

MS222
Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Haemoglobin Electrophoresis, ATP Levels and Corpuscular Fragility Curves,
W80-03988 5A

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Intraspecies Differences,
W80-03989 5C

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Interspecies Differences,
W80-03990 5C

MULTIPLE-PURPOSE RESERVOIRS
Benefits of Long-Range Streamflow Prediction,
W80-03901 6B

Recreation at the McClellan-Kerr Arkansas River Navigation System,
W80-04153 6B

MUNICIPAL WASTES
Least Cost Solutions to the Problem of Effluent Abatement in Urban Systems,
W80-04154 5D

Land Treatment of Municipal Wastewater Effluents: Design Factors-I.
W80-04166 5D

Land Treatment of Municipal Wastewater Effluents: Design Factors-II.
W80-04167 5D

Land Treatment of Municipal Wastewater Effluents: Case Histories.
W80-04168 5D

Utilization of Natural Ecosystems for Wastewater Renovation,
W80-04188 5D

MUNICIPAL WATER
Demineralization of Brackish Municipal Water Supplies--Comparative Costs,
W80-03978 6B

MYRIOPHYLLUM HETEROPHYLLUM
Chemistry of Water Milfoil Tissue: Seasonal Variation in Submersed Apices,
W80-03910 5A

NASHVILLE (TENN)
Ground-Water Resources in the Metropolitan Region of Nashville, Tennessee,
W80-04089 2F

NATIONAL WATER DATA EXCHANGE (NAWDEX)
Program Objectives for the National Water Data Exchange (NAWDEX) for Fiscal Year 1980,
W80-04088 10D

NATURAL RECHARGE
Regional Identification of Saline-Seep Recharge Areas, Stillwater and Yellowstone Counties, Montana,
W80-03959 2F

NEBRASKA
Impact of an Introduced Fish Species (Morone Americana) on the Fisheries Resources of Nebraska,
W80-04109 5C

NEOGOBIUS
Effect of Hexachloran on Oxygen Consumption of Neogobius Melanostomus and Neogobius Fluviatilis,
W80-03985 5C

NETWORK DESIGN
Design of Operational Precipitation and Streamflow Networks for River Forecasting,
W80-03939 7A

Sampling of Interrelated Random Fields: The Rainfall-Runoff Case,
W80-03940 7A

Considerations for the Design of a Hydrologic Data Network Using Multivariate Sensors,
W80-03941 7A

Statistical Considerations in Network Design,
W80-03942 7A

Development of Hydrometric Networks in British Columbia,
W80-03944 7A

Dimensionality Problems in Water Quality Network Design,
W80-04041 7A

Water Quality Sampling: Some Statistical Considerations,
W80-04042 7A

The Worth of Hydrologic Data,
W80-04043 7A

Network Design Using Optimal Estimation Procedures,
W80-04045 7A

Kriging in the Design of Streamflow Sampling Networks,
W80-04047 7A

NETWORKS
Dense Networks to Measure Convective Rainfall in the Southwestern United States,
W80-03943 7A

Development of Hydrometric Networks in British Columbia,
W80-03944 7A

A Case Study of Rationalization of a Rain Gage Network in Southwest England,
W80-04046 2B

Use of Principal Component Analysis to Identify Homogeneous Precipitation Stations for Optimal Interpolation,
W80-04048 7A

NEUTRALIZATION
Evaluation of Limestone Neutralization of Acidic Adirondack Surface Waters,
W80-03961 2K

NEVADA
The Pyramid Lake-Newlands Project Controversy, 1903-1926,
W80-03917 6B

Climatological Estimate of the Average Monthly Energy and Water Budgets of Lake Tahoe, California-Nevada,
W80-03953 2H

Application and Analysis of a Coupled Surface and Groundwater Model,
W80-04024 2E

NEW MEXICO
Dense Networks to Measure Convective Rainfall in the Southwestern United States,
W80-03943 7A

An Energy Budget Analysis of Water Use by Saltcedar,
W80-04020 2D

Termination of Hydrologic Data Collection (A Case Study),
W80-04049 6B

Consumptive Use and Yields of Crops in New Mexico,
W80-04107 2D

NEW YORK
Analysis of Changes in Ground-Water Levels in a Sewered and an Unsewered Area of Nassau County, Long Island, New York,
W80-04099 2F

NEWFOUNDLAND
Newfoundland's Claim to Offshore Mineral Resources: An Overview of the Legal Issues,
W80-04150 6E

NICHES
The Potential Effects of Energy Related Activities on the Seasonal Trajectories of Epiphytic Marine Diatoms,
W80-04125 5C

NITRATES
Statistical Analysis of Nitrate Concentrations from the River Frome (Dorset) for the Period 1965-76,
W80-04101 5B

NONPOINT POLLUTION
Planning for Nonpoint Pollution Control in North Carolina,
W80-04130 5B

Impact of Nonpoint Pollution Control on Western Lake Superior, Red Clay Project, Final Report: Summary,
W80-04181 2J

NORTH CAROLINA
Organic Carbon Cycling in a Swamp-Stream Ecosystem and Export by Streams in Eastern North Carolina,
W80-03906 5C

Phosphorus Cycling in the Creeping Swamp Floodplain Ecosystem and Exports from the Creeping Swamp Watershed,
W80-03907 5B

Public Participation in the North Carolina Statewide 208 Water Quality Planning Program: An Evaluation of the Problem Identification Phase of Planning,
W80-03909 6B

Planning for Nonpoint Pollution Control in North Carolina,
W80-04130 5B

Water Quality and Mining: A Management Plan,
W80-04180 5G

NORTH CAROLINA MINING ACT OF 1971
Water Quality and Mining: A Management Plan,
W80-04180 5G

NORTH-CENTRAL TENNESSEE
Ground-Water Resources in the Metropolitan Region of Nashville, Tennessee,
W80-04089 2F

NORTH DAKOTA
Water Resources Data for North Dakota, Water Year 1978,
W80-04085 7C

NORTHERN IRELAND
Post-War Land Drainage, Fertilizer Use and Environmental Impact in Northern Ireland,
W80-04115 4A

NUCLEAR MOISTURE METERS
The Application of the Gamma Neutron Method for Transport Studies in Field Soils,
W80-04032 2G

NUCLEOTIDES
Changes in Biochemistry of Some Aquatic Organisms of the Barents Sea Coast in Experimental Oil Intoxication,
W80-03996 5A

NUMERICAL ANALYSIS
Measurement and Numerical Simulation of Hysteretic Flow in a Heterogeneous Porous Medium,
W80-04023 2G

NUTRIENTS
Nutrients Limiting Phytoplankton Production in Ice-Covered Lake St. Clair,
W80-04051 5C

Phosphate Characteristics and Bioavailability of Suspended Sediments from Streams Draining Into Lake Erie,
W80-04054 5B

Addition of Nutrients to a Lake Leads to Greatly Increased Catch of Salmon,
W80-04114 5C

OCEAN DUMPING
Shelf-Sediment Dynamics and Solid-Waste Disposal,
W80-04063 5C

Dredged Material, Ocean Disposal, and the Regulatory Maze,
W80-04075 5C

OGALLALA AQUIFER (TX)
Water Resource Uses and Issues in Texas,
W80-03933 7C

OHIO
Multiobjective Optimization in Water Quality and Land Management,
W80-04027 5B

Chemical and Biological Quality of Selected Lakes in Ohio - 1976 and 1977,
W80-04087 2H

Water-Quality Assessment of Rattlesnake Creek Watershed, Ohio,
W80-04091 5A

OIL
Degradation of the Crude Oil by Arthrobacter Sp. (In Japanese),
W80-04002 5A

Long-Term Effects of Water-Soluble Fractions of Kuwait Crude Oil on the Larval and Juvenile Development of the Mud Crab Eurypanopeus Depressus,
W80-04004 5A

OIL POLLUTION
Fundamental Studies on the Influence of Oil Pollution Upon Marine Organisms--V The Toxicity of the Gelling Compounds for Petroleum to Marine Organisms (In Japanese),
W80-03981 5A

Investigations of Physical Process,
W80-04078 5C

Biological Observations,
W80-04081 5C

Mitigating Oil Spill Damage--Ecologically Responsible Clean-Up Techniques,
W80-04192 5C

Coastal Impact Mitigation and OCS-Induced Oil and Gas Development: A Perspective of the Clean Water Act's Section 404 Guidelines,
W80-04193 5C

OIL SPILLS
Liability Without Fault Under the Federal Water Pollution Control Act,
W80-03971 6E

Investigations of Physical Process,
W80-04078 5C

Chemical Composition of Selected Environmental and Petroleum Samples from the Amoco Cadiz Oil Spill,
W80-04079 5C

Investigations of Beach Processes,
W80-04080 5C

Biological Observations,
W80-04081 5C

Oil Spill Cleanup Activities,
W80-04082 5C

A Chance-Constrained Goal Programming Model to Evaluate Response Resources for Marine Pollution Disasters,
W80-04164 6A

Mitigating Oil Spill Damage--Ecologically Responsible Clean-Up Techniques,
W80-04192 5C

OKLAHOMA
Spatial Variability of Infiltration in a Watershed,
W80-04062 2G

Water Resources Data for Oklahoma, Water Year 1978--Volume 1. Arkansas River Basin,
W80-04083 7C

Water Resources Data for Oklahoma, Water Year 1978--Volume 2. Red River Basin,
W80-04084 7C

OLIGOTROPHY
Distribution and Quantitative Development of Aquatic Macrophytes in Relation to Sediment Characteristics in Oligotrophic Lake Kalgaard, Denmark,
W80-04172 5C

ON-SITE INVESTIGATIONS
In Situ Measurements of Net Primary Production in a Colorado Mountain Stream,
W80-04140 5C

OPTIMIZATION
Optimized Economic Use of Sludge Treatment Facilities in Durban,
W80-03979 5B

Multiobjective Optimization in Water Quality and Land Management,
W80-04027 5B

Least Cost Solutions to the Problem of Effluent Abatement in Urban Systems,
W80-04154 5D

Optimizing the Benefits of Investments in Sewerage in Developing Countries,
W80-04163 6B

Optimal Water Use and Salinity Control for Energy--Upper Colorado River Basin,
W80-04190 6A

OREGON
Turbidity-Induced Meromixis in an Oregon Reservoir: Hypothesis,
W80-03948 2H

ORGANIC COMPOUNDS
Organic Carbon Cycling in a Swamp-Stream Ecosystem and Export by Streams in Eastern North Carolina,
W80-03906 5C

Fundamental Studies on the Influence of Oil Pollution Upon Marine Organisms--V The Toxicity of the Gelling Compounds for Petroleum to Marine Organisms (In Japanese),
W80-03981 5A

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Haemoglobin Electrophoresis, ATP Levels and Corpuscular Fragility Curves,
W80-03988 5A

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Intraspecies Differences,
W80-03989 5C

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Interspecies Differences,
W80-03990 5C

ORGANIC MATTER
Estimating Soil Water Retention Characteristics from Particle Size Distribution, Organic Matter Percent, and Bulk Density,
W80-04038 2G

Distribution and Quantitative Development of Aquatic Macrophytes in Relation to Sediment

Characteristics in Oligotrophic Lake Kalgaard, Denmark,
W80-04172 5C

ORGANIZATIONS
West European Institutional Arrangements for Environmental Policy Implementation-Especially Air and Water Pollution Control,
W80-04200 6E

OUTER CONTINENTAL SHELF
Shelf-Sediment Dynamics and Solid-Waste Disposal,
W80-04063 5C

Waste Disposal and Dredging Activities: The Geological Perspective,
W80-04064 5C

Stability of Dredged Material Deposited Seaward of the Columbia River Mouth,
W80-04065 5C

Geologic Effects of Ocean Dumping on the New York Bight Inner Shelf,
W80-04066 5C

Depositional Characteristics of Sediments at a Low Energy Ocean Disposal Site, Savannah, Georgia,

The Fishery Conservation and Management Act as a Tool for Mitigation in Outer Continental Shelf Petroleum Development,
W80-04195 5C

The Mississippi, Alabama, Florida, Outer Continental Shelf Baseline Environmental Survey - MAFLA 1977/1978. Volume 1-B. Executive Summary Report.
W80-04196 5C

OTEC Physical and Climatic Environmental Impacts: An Overview of Modeling Efforts and Needs,
W80-04197 5C

Progress Report for the Environmental Impact Assessment Program for the 1-MWe Early Ocean Test Platform,
W80-04198 5C

OVERLAND FLOW
Stabilized Sand Surfaces for Overland Flow Studies,
W80-03945 2E

OXYGEN-ACTIVATED SLUDGE TREATMENT
Status of Oxygen-Activated Sludge Wastewater Treatment.
W80-04170 5D

OXYGEN REQUIREMENTS
Effect of Hexachloran on Oxygen Consumption of Neogobius Melanostomus and Neogobius Fluviatilis,
W80-03985 5C

On the Resistance of Isolated Bivalve Gill Pieces to Oxygen Deficiency and Hydrogen Sulphide,
W80-04009 5C

OZONE
Maximum Utilization of Water Resources in a Planned Community: Chlorine and Ozone Toxicity Evaluation,
W80-03921 5C

PACIFIC NORTHWEST U.S.
Undeveloped Hydropower As a Potential Energy Source in Idaho,
W80-03918 6B

PACIFIC OCEAN
Mercury Contents of Zooplankton Collected in the Tropical Pacific Ocean,
W80-04007 5A

PARTICLE SIZE
Estimating Soil Water Retention Characteristics from Particle Size Distribution, Organic Matter Percent, and Bulk Density,
W80-04038 2G

PATH OF POLLUTANTS
Non-Point Source Sedimentation Studies Using Infrared Remote Sensing,
W80-03923 5B

Soil Suitability for On-Site Waste Disposal: Development of Genetically Marked Escherichia coli Strains as Tracers of Subsurface Water Flow,
W80-04017 5E

PATHOGENIC AMOEBAE
Analysis of Nevada Surface Waters for Pathogenic Amoebae as Indicators of Thermal Pollution,
W80-03960 5A

PAWCATUCK RIVER BASIN
Geohydrologic Data for the Beaver-Pasquiset Ground-Water Reservoir, Rhode Island,
W80-04098 7C

PBC SPILLS
Polychlorinated Biphenyls: Phytotoxicity, Absorption and Translocation by Plants, and Inactivation by Activated Carbon,
W80-03924 5C

PEAK DISCHARGE
Use of Extreme Value Theory in Estimating Flood Peaks from Mixed Populations,
W80-04015 2E

PENNSYLVANIA
Inventory and Evaluation of Elevated Sand Mound Sewage Disposal Systems in Pennsylvania,
W80-03912 5D

Design of Operational Precipitation and Streamflow Networks for River Forecasting,
W80-03939 7A

PERNA
On the Resistance of Isolated Bivalve Gill Pieces to Oxygen Deficiency and Hydrogen Sulphide,
W80-04009 5C

PERSISTENCE
Persistence Modeling for the Potomac and Adjacent Rivers,
W80-03916 2E

A Stochastic Description of Wet and Dry Spells in Terms of an Effective Number of Days,
W80-03938 6A

PESTICIDE TOXICITY
Effect of Hexachloran on Oxygen Consumption of Neogobius Melanostomus and Neogobius Fluviatilis,
W80-03985 5C

DDE-Contaminated Fish Off Los Angeles Are Suspected Cause in Deaths of Captive Marine Birds,
W80-03986 5C

PESTICIDES
Studies on Chemotherapy of Fish Diseases with Piromidic Acid--I. Absorption, Distribution, Excretion and Toxicity of Piromidic Acid in Some Species of Fishes,
W80-04012 5B

PHAEOPHYTA
Chelation of Divalent Metal Ions by Brown Algal Polyphenols,
W80-03987 2C

The Effect of Dissolved Copper on the Increase in Length of Four Species of Intertidal Fucoid Algae,
W80-03992 5A

Changes in Biochemistry of Some Aquatic Organisms of the Barents Sea Coast in Experimental Oil Intoxication,
W80-03996 5A

PHILIP'S EQUATION
Spatial Variability of Infiltration in a Watershed,
W80-04062 2G

PHOSPHATES
Interactions of Mining and Water Resource Systems in the Southeastern Idaho Phosphate Field,
W80-04104 2F

Construction and Application of a Water Quality Model for the Upper Blackfoot River Basin in the Caribou National Forest, Idaho,
W80-04105 6A

PHOSPHORUS
Phosphorus Dynamics in a Piedmont Reservoir,
W80-03908 2H

Storm Travel Distance Calculations for Total Phosphorus and Suspended Materials in Rivers,
W80-03930 5B

A Note on Error Analysis for a Phosphorus Retention Model,
W80-04040 2H

Phosphate Characteristics and Bioavailability of Suspended Sediments from Streams Draining Into Lake Erie,
W80-04054 5B

Phosphorus Loading Associated with Housing in a Rural Watershed,
W80-04055 5B

Applying Phosphorus Loading Models to Embayments,
W80-04123 5B

Phosphatase Activity and Its Role in the Mineralization of Organic Phosphorus in Coastal Sea Water,
W80-04141 5F

PHOSPHORUS CYCLING
Phosphorus Cycling in the Creeping Swamp Floodplain Ecosystem and Exports from the Creeping Swamp Watershed,
W80-03907 5B

PHOTOSYNTHESIS
DDT-Induced Changes in the Activity of the Photosynthetic System of Aquatic Plants,
W80-03998 5C

Some Photosynthetic Carbon Fixation Properties of Seagrasses,
W80-04129 5C

Physiological Aspects of Primary Production in Seagrasses,
W80-04134 2L

Photosynthetic Carboxylating Enzymes in Marine Phytoplankton,
W80-04146 5C

PHYTOPLANKTON
Indication of Anthropogenic Eutrofication in Lake Ladoga,
W80-04010 5C

Nutrients Limiting Phytoplankton Production in Ice-Covered Lake St. Clair,
W80-04051 5C

Possible Relation Between Phytoplankton Numbers and Saprolegnioid Fungi in Shatt Al-Arab Near Basrah, Iraq,
W80-04119 5F

Turbulence and Phytoplankton Diversity: A General Model of the 'Paradox of Plankton',
W80-04138 5C

Buoyancy of Natural Populations of Marine Phytoplankton,
W80-04139 5C

MARS - A New Instrument for Measuring Phytoplankton Sinking Rate,
W80-04142 7B

Photosynthetic Carboxylating Enzymes in Marine Phytoplankton,
W80-04146 5C

Phytoplankton Modeling Involving Random Rate Constants. Part I: Deterministic Setting,
W80-04151 5C

Production of Vitamin B12, Thiamine, and Biotin by Freshwater Phytoplankton,
W80-04169 2H

PIPELINES
Quality and Treatment of Water Involved with Coal Slurry Transport by Pipeline,
W80-04108 5D

PLANKTON
Features of the Structure and Trophic Links of Planktonic Associations in Two Lakes With Differnet Degress of Salinity,
W80-03963 5C

PLANNING
Public Participation in the North Carolina Statewide 208 Water Quality Planning Program: An Evaluation of the Problem Identification Phase of Planning,
W80-03909 6B

Optimal Allocation of Water Resources in An Input-Output Framework: User's Manual,
W80-03915 6A

Multiobjective Dynamic Programming: A Classic Problem Redressed,
W80-04026 4A

Program Objectives for the National Water Data Exchange (NAWDEX) for Fiscal Year 1980,
W80-04088 10D

Planning for Nonpoint Pollution Control in North Carolina,
W80-04130 5B

Environmental Implications of Water Development for Developing Countries,
W80-04186 6D

PLANT GROWTH
Polychlorinated Biphenyls: Phytotoxicity, Absorption and Translocation by Plants, and Inactivation by Activated Carbon,
W80-03924 5C

Growth, Chlorophyll and Mineral Nutrient Studies on Phalaris Arundinaceae L. in Three Scottish Lochs,
W80-04147 5C

PLANT PHYSIOLOGY
Some Photosynthetic Carbon Fixation Properties of Seagrasses,
W80-04129 5C

Physiological Aspects of Primary Production in Seagrasses,
W80-04134 2L

PLANT TISSUES
Chemistry of Water Milfoil Tissue: Seasonal Variation in Submersed Apices,
W80-03910 5A

PLATTE RIVER BASIN (NEBR)
Simulated Changes in Ground-Water Levels and Streamflow Resulting from Future Development (1970 to 2020) in the Platte River Basin, Nebraska,
W80-04096 6A

PLECOGLOSSUS
Studies on Chemotherapy of Fish Diseases with Piromidic Acid--I. Absorption, Distribution, Excretion and Toxicity of Piromidic Acid in Some Species of Fishes,
W80-04012 5B

POINT SINGULARITIES
Modeling Groundwater Flow Fields Containing Point Singularities: Streamlines, Travel Times, and Breakthrough Curves,
W80-03956 2F

POLICY
Some Policy Implications of Water Development,
W80-04184 6D

West European Institutional Arrangements for Environmental Policy Implementation-Especially Air and Water Pollution Control,
W80-04200 6E

POLITICAL ASPECTS
Participation in Water Resources Planning: Leader and Non-Leader Comparisons,
W80-03903 6B

Some Policy Implications of Water Development,
W80-04184 6D

POLITICAL CONSTRAINTS
Environmental Alternatives and Social Goals,
W80-04157 6E

POLLUTANT IDENTIFICATION
Distribution of Pollutants from a New Paper Plant in Southern Lake Champlain, Vermont and New York,
W80-04126 5B

POLLUTANTS
Volatile Chloro- and Chlorofluorocarbons in Lake Erie--1977 and 1978,
W80-04058 5A

POLLUTION
Incorporation of Perceptual Standards Into a Water Quality Information System,
W80-03966 6A

Environmental Problems of Developing Countries,
W80-03969 6E

POLLUTION ABATEMENT
Least Cost Solutions to the Problem of Effluent Abatement in Urban Systems,
W80-04154 5D

Man-Induced Modifications in Estuaries of the Northern Gulf of Mexico: Their Impacts on Fishery Resources and Measures of Mitigation,
W80-04191 5C

Mitigating Oil Spill Damage--Ecologically Responsible Clean-Up Techniques,
W80-04192 5C

Coastal Impact Mitigation and OCS-Induced Oil and Gas Development: A Perspective of the Clean Water Act's Section 404 Guidelines,
W80-04193 5C

Pre-Impact Process Analysis: Design for Mitigation,
W80-04194 5C

POLLUTION TAXES (CHARGES)
The Pollution Control Tax Incentive: A Non-Incentive,
W80-03968 6E

POLYCHLORINATED BIPHENYLS
Polychlorinated Biphenyls: Phytotoxicity, Absorption and Translocation by Plants, and Inactivation by Activated Carbon,
W80-03924 5C

POLYELECTROLYTES
Selection and Use of Polymers in Contact Filtration,
W80-04018 5F

POLYMERS
Functional Polymers for Removal of Heavy-Metal Pollutants from Water,
W80-03911 5D

Selection and Use of Polymers in Contact Filtration,
W80-04018 5F

POLYPHLOROGLUCINOLS
Chelation of Divalent Metal Ions by Brown Algal Polyphenols,
W80-03987 2C

PONDS
The Development of Palis: A Ponds and Lakes Information System for Massachusetts,
W80-03902 6A

PONDWEED
DDT-Induced Changes in the Activity of the Photosynthetic System of Aquatic Plants,
W80-03998 5C

PONDWEEDS
Uptake and Release of Nutrients by Aquatic Macrophytes,
W80-04136 5C

POPULATION
Growth and Population Studies on Tilapia Galilaea in Lake Kinneret,
W80-04152 5G

POPULATION DYNAMICS
Seasonal Variation in the Populations of Moina Macrocopa Strauss and Moina Micrura Kurz (Crustacea: Cladocera) in Zoafaraniyah Pools,
W80-04121 5B

Turbulence and Phytoplankton Diversity: A General Model of the 'Paradox of Plankton',
W80-04138 5C

POROUS MEDIA
Mathematical Modelling of Ground-Water Flow,
W80-03927 2F

Measurement and Numerical Simulation of Hysteretic Flow in a Heterogeneous Porous Medium,
W80-04023 2G

POTABLE WATER
Human Viruses in the Aquatic Environment: A Status Report with Emphasis on the EPA Research Program.
W80-03922 5A

POTAMOGETON
DDT-Induced Changes in the Activity of the Photosynthetic System of Aquatic Plants,
W80-03998 5C

POTENTIAL WATER SUPPLY
Water Resources of the Lower Elwha Indian Reservation, Washington,
W80-04086 2F

PRASEODYMIUM RADIOISOTOPES
Roles of Food and Sea Water in the Accumulation of Radionuclides by Marine Fish,
W80-04000 5A

PRAWNS
The Bacterial Flora of Certain Marine Fishes and Prawns in Cochin Waters in Relation to Their Environs,
W80-03984 5C

PRECIPITATION (ATMOSPHERIC)
Design of Operational Precipitation and Streamflow Networks for River Forecasting,
W80-03939 7A

A Case Study of Rationalization of a Rain Gage Network in Southwest England,
W80-04046 2B

Use of Principal Component Analysis to Identify Homogeneous Precipitation Stations for Optimal Interpolation,
W80-04048 7A

PRICING
Rebuttal of 'Economic Value of Natural Coastal Wetlands: A Critique',
W80-04158 6B

PRIMARY PRODUCTIVITY
Primary Production of Algae Growing on Natural and Artificial Aquatic Plants: A Study of Interactions Between Epiphytes and Their Substrate,
W80-04131 2I

Physiological Aspects of Primary Production in Seagrasses,
W80-04134 2L

Distribution and Aspects of the Production and Biomass of Eelgras, Zostera Marina L., at Roscoff, France,
W80-04137 2I

In Situ Measurements of Net Primary Production in a Colorado Mountain Stream,
W80-04140 5C

Analysis of Heterotrophic Microplankton in an Upwelling Area,
W80-04145 5C

Photosynthetic Carboxylating Enzymes in Marine Phytoplankton,
W80-04146 5C

Primary Production and Bacterioplankton in Fish Ponds with Mono and Poly-Culture,
W80-04148 5C

Phytoplankton Modeling Involving Random Rate Constants. Part I: Deterministic Setting,
W80-04151 5C

Production of Vitamin B12, Thiamine, and Biotin by Freshwater Phytoplankton,
W80-04169 2H

PRODUCTIVITY
Effect of Salinity of the Water on Macrophytes in Lakes of the South Ural Zone,
W80-03993 5C

Addition of Nutrients to a Lake Leads to Greatly Increased Catch of Salmon,
W80-04114 5C

PROGRAMS
Program Objectives for the National Water Data Exchange (NAWDEX) for Fiscal Year 1980,
W80-04088 10D

PROJECT PURPOSES
Environmental Implications of Water Development for Developing Countries,
W80-04186 6D

PROJECTIONS
Simulated Changes in Ground-Water Levels and Streamflow Resulting from Future Development (1970 to 2020) in the Platte River Basin, Nebraska,
W80-04096 6A

PUBLIC HEALTH
Human Viruses in the Aquatic Environment: A Status Report with Emphasis on the EPA Research Program.
W80-03922 5A

Domestic Water Supplies, Health and Poverty: A Brief Review,
W80-04183 6D

Environmental Implications of Water Development for Developing Countries,
W80-04186 6D

PUBLIC PARTICIPATION
Participation in Water Resources Planning: Leader and Non-Leader Comparisons,
W80-03903 6B

PUBLIC UTILITIES
Water Rate Policy: Lessons from Less Developed Countries,
W80-04162 6C

PUERTO RICO
A Rainfall-Runoff Analysis of the Geomorphologic IUH,
W80-03958 2A

PULP AND PAPER INDUSTRY
Wood Pulp, Water Pollution, and Advertising,
W80-03972 6E

Distribution of Pollutants from a New Paper Plant in Southern Lake Champlain, Vermont and New York,
W80-04126 5B

PULP WASTES
Distribution of Pollutants from a New Paper Plant in Southern Lake Champlain, Vermont and New York,
W80-04126 5B

PUNTA SAN JUAN
Analysis of Heterotrophic Microplankton in an Upwelling Area,
W80-04145 5C

RADAR
Rainfall Measurements by Weather Radar: Applications to Hydrology,
W80-03929 7B

RADIOISOTOPES
Kinetics of Accumulation of Some Radionuclides by Marine Bacteria,
W80-03997 5A

Roles of Food and Sea Water in the Accumulation of Radionuclides by Marine Fish,
W80-04000 5A

RAIN GAGE NETWORKS
A Case Study of Rationalization of a Rain Gage Network in Southwest England,
W80-04046 2B

RAIN GAGES
A Case Study of Rationalization of a Rain Gage Network in Southwest England,
W80-04046 2B

RAINFALL
Rainfall Measurements by Weather Radar: Applications to Hydrology,
W80-03929 7B

A Stochastic Description of Wet and Dry Spells in Terms of an Effective Number of Days,
W80-03938 6A

Discharge Response Analysis and Hydrologic Similarity: The Interrelation Between the Geomorphologic IUH and the Storm Characteristics.
W80-03957 2A

A Rainfall-Runoff Analysis of the Geomorphologic IUH,
W80-03958 2A

Network Design Using Optimal Estimation Procedures,
W80-04045 7A

RAINFALL DISPOSITION
Dense Networks to Measure Convective Rainfall in the Southwestern United States,
W80-03943 7A

RAINFALL INTENSITY
Measurements of Rainfall Intensity, Instrumentation and Data Processing,
W80-04028 2B

RAINFALL MEASUREMENTS
Rainfall Measurements by Weather Radar: Applications to Hydrology,
W80-03929 7B

RATTLESNAKE CREEK WATERSHED (OHIO)
Water-Quality Assessment of Rattlesnake Creek Watershed, Ohio,
W80-04091 5A

RECHARGE AREA
Regional Identification of Saline-Seep Recharge Areas, Stillwater and Yellowstone Counties, Montana,
W80-03959 2F

RECHARGE PONDS
Regional Identification of Saline-Seep Recharge Areas, Stillwater and Yellowstone Counties, Montana,
W80-03959 2F

RECLAIMED WATER
Renovation of Septic Tank Effluent in Sand-Clay Mixtures,
W80-03913 5D

CCE-m Values of Natural and Recharged Groundwaters,
W80-04110 5B

RECREATION
Keep Recreational Waters Algae-Free,
W80-04116 5G

Recreation at the McClellan-Kerr Arkansas River Navigation System,
W80-04153 6B

RED RIVER BASIN (OKLA)
Water Resources Data for Oklahoma, Water Year 1978--Volume 2. Red River Basin.
W80-04084 7C

REGIONAL ANALYSIS
Estimation of Floods of Various Frequencies for the Small Ephemeral Streams in Eastern Washington,
W80-04093 2E

REGRESSION ANALYSIS
Estimating Soil Water Retention Characteristics from Particle Size Distribution, Organic Matter Percent, and Bulk Density,
W80-04038 2G

A Quantitative Analysis of Streamflow: The Importance of Precipitation and Geomorphic Factors in Determining Yields from Small Watersheds,
W80-04106 6A

REGULATIONS
Dredged Material, Ocean Disposal, and the Regulatory Maze,
W80-04075 5C

REHABILATION
Renovation of Septic Tank Effluent in Sand-Clay Mixtures,
W80-03913 5D

RELIABILITY
Reliability-Constrained Reservoir Control Problems, 1. Methodological Issues,
W80-04031 2H

REMOTE SENSING
Non-Point Source Sedimentation Studies Using Infrared Remote Sensing,
W80-03923 5B

Multidate Landsat Lake Quality Monitoring Program,
W80-04118 7B

REPRODUCTION
Seasonal Variation in the Populations of Moina Macrocopa Strauss and Moina Micrura Kurz (Crustacea: Cladocera) in Zoafaraniyah Pools,
W80-04121 5B

RESEARCH PRIORITIES
Termination of Hydrologic Data Collection (A Case Study),
W80-04049 6B

RESERVOIR OPERATION
Reliability-Constrained Reservoir Control Problems, 1. Methodological Issues,
W80-04031 2H

On the Problem of Discretization in Dam Theory,
W80-04033 2H

RESERVOIRS
Phosphorus Dynamics in a Piedmont Reservoir,
W80-03908 2H

Turbidity-Induced Meromixis in an Oregon Reservoir: Hypothesis,
W80-03948 2H

Multiobjective Dynamic Programming with Application to a Reservoir,
W80-04025 4A

Multiobjective Dynamic Programming: A Classic Problem Redressed,
W80-04026 4A

Reliability-Constrained Reservoir Control Problems, 1. Methodological Issues,
W80-04031 2H

On the Problem of Discretization in Dam Theory,
W80-04033 2H

The Linear Reservoir with Markovian Inflows,
W80-04035 2H

RESOURCES DEVELOPMENT
Eastern Gulf of Mexico Marine Habitat Study. Volume I.
W80-04076 5B

Man-Induced Modifications in Estuaries of the Northern Gulf of Mexico: Their Impacts on Fishery Resources and Measures of Mitigation,
W80-04191 5C

Coastal Impact Mitigation and OCS-Induced Oil and Gas Development: A Perspective of the Clean Water Act's Section 404 Guidelines,
W80-04193 5C

Pre-Impact Process Analysis: Design for Mitigation,
W80-04194 5C

The Fishery Conservation and Management Act as a Tool for Mitigation in Outer Continental Shelf Petroleum Development,
W80-04195 5C

The Mississippi, Alabama, Florida, Outer Continental Shelf Baseline Environmental Survey - MAFLA 1977/1978. Volume 1-B. Executive Summary Report.
W80-04196 5C

RETENTION
Estimating Soil Water Retention Characteristics from Particle Size Distribution, Organic Matter Percent, and Bulk Density,
W80-04038 2G

REVERSE OSMOSIS
Demineralization of Brackish Municipal Water Supplies--Comparative Costs,
W80-03978 6B

RHODAMINE
Dumanli Spring, Turkey--The Largest Karstic Spring in the World,
W80-04029 2F

Stability of Rhodamine WT in Saline Waters,
W80-04036 2L

RHODE ISLAND
Geohydrologic Data for the Beaver-Pasquiset Ground-Water Reservoir, Rhode Island,
W80-04098 7C

RHODIUM RADIOISOTOPES
Roles of Food and Sea Water in the Accumulation of Radionuclides by Marine Fish,
W80-04000 5A

RISKS
A Chance-Constrained Goal Programming Model to Evaluate Response Resources for Marine Pollution Disasters,
W80-04164 6A

RIVER FLOW
Dumanli Spring, Turkey--The Largest Karstic Spring in the World,
W80-04029 2F

RIVER FORECASTING
Design of Operational Precipitation and Streamflow Networks for River Forecasting,
W80-03939 7A

RIVER FROME (UK)
Statistical Analysis of Nitrate Concentrations from the River Frome (Dorset) for the Period 1965-76,
W80-04101 5B

RIVERS
Skeletonema Potamos (Weber) Hasle and Cyclotella Atomus Hustedt (Bacillariophyceae) in the Plankton of Rivers in England and France,
W80-04120 2I

RNA
Changes in Biochemistry of Some Aquatic Organisms of the Barents Sea Coast in Experimental Oil Intoxication,
W80-03996 5A

ROAD NETWORKS
Impact of Road Networks on Southeastern Michigan Lakeshore Drainage,
W80-03951 2E

ROCKY MOUNTAINS (IDAHO)
A Quantitative Analysis of Streamflow: The Importance of Precipitation and Geomorphic Factors in Determining Yields from Small Watersheds,
W80-04106 6A

ROOT ZONE
Calculation of Water Balance in the Crop Root Zone by Computer,
W80-03937 2G

ROSCOFF
Distribution and Aspects of the Production and Biomass of Eelgras, Zostera Marina L., at Roscoff, France,
W80-04137 2I

ROSS BAY (IRELAND)
Preliminary Observations on the Benthic Macroinvertebrate Communities of Ross Bay, A Polluted Area of Lough Leane, South-West Ireland,
W80-03934 5B

RUNOFF
Discharge Response Analysis and Hydrologic Similarity: The Interrelation Between the Geomorphologic IUH and the Storm Characteristics,
W80-03957 2A

A Rainfall-Runoff Analysis of the Geomorphologic IUH,
W80-03958 2A

Triazine Residues in Suspended Solids (1974-1976) and Water (1977) from the Mouths of Canadian Streams Flowing Into the Great Lakes,
W80-04056 5A

RURAL AREAS
Domestic Water Supplies, Health and Poverty: A Brief Review,
W80-04183 6D

RURAL WATER SUPPLY
Management of Rural Water Supplies,
W80-04185 6D

RUTHENIUM RADIOISOTOPES
Roles of Food and Sea Water in the Accumulation of Radionuclides by Marine Fish,
W80-04000 5A

SAFETY FACTORS
Mitigating Oil Spill Damage--Ecologically Responsible Clean-Up Techniques,
W80-04192 5C

SAGINAW BAY
Applying Phosphorus Loading Models to Embayments,
W80-04123 5B

SALINE LAKES
Impact of an Introduced Fish Species (Morone Americana) on the Fisheries Resources of Nebraska,
W80-04109 5C

SALINE SEEP
Regional Identification of Saline-Seep Recharge Areas, Stillwater and Yellowstone Counties, Montana,
W80-03959 2F

SALINE SOILS
Analytical Solutions for Predicting Solute Movement and Their Interpretation in Reclamation,
W80-03936 2G

SALINE WATER
Regional Identification of Saline-Seep Recharge Areas, Stillwater and Yellowstone Counties, Montana,
W80-03959 2F

Stability of Rhodamine WT in Saline Waters,
W80-04036 2L

SALINITY
Features of the Structure and Trophic Links of Planktonic Associations in Two Lakes With Different Degress of Salinity,
W80-03963 5C

An Economic Evaluation of the Salinity Impacts from Energy Development: The Case of the Upper Colorado River Basin,
W80-03964 6B

Effect of Salinity of the Water on Macrophytes in Lakes of the South Ural Zone,
W80-03993 5C

SALINITY REDUCTION
An Economic Evaluation of the Salinity Impacts from Energy Development: The Case of the Upper Colorado River Basin,
W80-03964 6B

SALMON
Addition of Nutrients to a Lake Leads to Greatly Increased Catch of Salmon,
W80-04114 5C

SALT MARSHES
Studies on the Plant Community of a North Florida Salt Marsh Part II. Nutritive Value and Decomposition,
W80-03975 5C

SAMPLING
An Optimal Sampling Procedure for the Collection of Residential Water Use Data,
W80-03931 6D

Sampling of Interrelated Random Fields: The Rainfall-Runoff Case,
W80-03940 7A

Considerations for the Design of a Hydrologic Data Network Using Multivariate Sensors,
W80-03941 7A

Dimensionality Problems in Water Quality Network Design,
W80-04041 7A

Water Quality Sampling: Some Statistical Considerations,
W80-04042 7A

Network Design Using Optimal Estimation Procedures,
W80-04045 7A

Kriging in the Design of Streamflow Sampling Networks,
W80-04047 7A

A Statistical Approach to Station Discontinuance,
W80-04050 2E

Volatile Chloro- and Chlorofluorocarbons in Lake Erie--1977 and 1978,
W80-04058 5A

Numerical Abundance and Biomass of Bacteria, Algae and Macrobenthos of a Large Northern River, the Athabasca,
W80-04127 5C

SAMPLING THEORY
An Optimal Sampling Procedure for the Collection of Residential Water Use Data,
W80-03931 6D

SAN DIEGO AQUEDUCT
Thermal Modeling of Flow in the San Diego Aqueduct, California, and Its Relation to Evaporation,
W80-04102 2D

SAN DIEGO AQUEDUCT (CALIF)
Comprehensive Monitoring of Meteorology, Hydraulics, and Thermal Regime of the San Diego Aqueduct, California,
W80-04100 2D

SAND BARS
Wave-Induced Liquefaction: A Modern Example from the Bay of Fundy,
W80-04061 2L

SARDINES
The Bacterial Flora of Certain Marine Fishes and Prawns in Cochin Waters in Relation to Their Environs,
W80-03984 5C

SAROTHERODON
Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Haemoglobin Electrophoresis, ATP Levels and Corpuscular Fragility Curves,
W80-03988 5A

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Intraspecies Differences,
W80-03989 5C

Haematological Assessment of the Effects of the Anaesthetic MS222 in Natural and Neutralized Form in Three Freshwater Fish Species: Interspecies Differences,
W80-03990 5C

SCOTLAND
Growth, Chlorophyll and Mineral Nutrient Studies on Phalaris Arundinaceae L. in Three Scottish Lochs,
W80-04147 5C

SEA OF JAPAN
Heat Resistance of Cells of Upper Sublittoral Bivalve Mollusks of Sandy Infauna in Peter the Great Bay (Sea of Japan),
W80-03983 5C

SEASONAL
Seasonal Changes in Structure of a Submerged Bluegreen Algal/Bacterial Community from a Geothermal Hostspring,
W80-04117 5C

Seasonal Variation in the Populations of Moina Macrocopa Strauss and Moina Micrura Kurz (Crustacea: Cladocera) in Zoafaraniyah Pools,
W80-04121 5B

SEASONAL VARIATIONS
Chemistry of Water Milfoil Tissue: Seasonal Variation in Submersed Apices,
W80-03910 5A

SECOND GENERATION OPEN REACTOR OXYGEN SYSTEM (MAROX)
Status of Oxygen-Activated Sludge Wastewater Treatment,
W80-04170 5D

SECONDARY PRODUCTIVITY
Consumer Regulation of Nutrient Cycling,
W80-04122 5B

SECONDARY TREATMENT
Effects of Nonsettleable Biosolids on Stream Organisms,
W80-03991 5C

SEDIMENT TRANSPORT
Sources of Sediment Induced Reductions in Water Quality Appraised from Catchment Attributes and Land Use,
W80-03967 4D

On the Threshold of Transport of Sand-Sized Sediment Under the Combined Influence of Unidirectional and Oscillatory Flow,
W80-04060 2J

Mud Deposits Near the New York Bight Dumpsites: Origin and Behavior,
W80-04068 5C

Distribution of Suspended Particulate Matter Near Sewage Outfalls in Santa Monica Bay, California,
W80-04074 5C

SEDIMENTATION
Sources of Sediment Induced Reductions in Water Quality Appraised from Catchment Attributes and Land Use,
W80-03967 4D

Water Quality and Mining: A Management Plan.
W80-04180 5G

Impact of Nonpoint Pollution Control on Western Lake Superior, Red Clay Project, Final Report: Summary,
W80-04181 2J

SEDIMENTATION CONTROL
Water Quality and Mining: A Management Plan.
W80-04180 5G

SEDIMENTOLOGY
On the Threshold of Transport of Sand-Sized Sediment Under the Combined Influence of Unidirectional and Oscillatory Flow,
W80-04060 2J

SEDIMENTS
Sediment Mixing by Lampsilis Radiata Siliquoidea (Mollusca) from Western Lake Erie,
W80-04053 2J

Stability of Dredged Material Deposited Seaward of the Columbia River Mouth,
W80-04065 5C

Depositional Characteristics of Sediments at a Low Energy Ocean Disposal Site, Savannah, Georgia,
W80-04067 5

Mud Deposits Near the New York Bight Dumpsites: Origin and Behavior,
W80-04068 5C

Containment of Particulate Wastes at Open-Water Disposal Sites,
W80-04069 5C

No Waste Disposal Sites on the Continental Shelf Off the Middle Atlantic States: Observations Made from Submersibles,
W80-04072 5C

Investigations of Beach Processes,
W80-04080 5C

Distribution of Pollutants from a New Paper Plant in Southern Lake Champlain, Vermont and New York,
W80-04126 5B

A Diatom Assemblage Living Below the Surface of Intertidal Sand Flats,
W80-04143 2L

Distribution and Quantitative Development of Aquatic Macrophytes in Relation to Sediment Characteristics in Oligotrophic Lake Kalgaard, Denmark,
W80-04172 5C

SELENIUM
Elemental Content of Aquatic Organisms Inhabiting a Pond Contaminated with Coal Fly Ash,
W80-04011 5B

SEPTIC TANKS
Inventory and Evaluation of Elevated Sand Mound Sewage Disposal Systems in Pennsylvania.
W80-03912 5D

Renovation of Septic Tank Effluent in Sand-Clay Mixtures,
W80-03913 5D

Hydraulic Evaluation of a Mound System in Maine,
W80-03962 5B

Soil Suitability for On-Site Waste Disposal: Development of Genetically Marked Escherichia coli Strains as Tracers of Subsurface Water Flow,
W80-04017 5E

Evaluation of Mound Systems for Purification of Septic Tank Effluent,
W80-04112 5D

SERIOLA
Roles of Food and Sea Water in the Accumulation of Radionuclides by Marine Fish,
W80-04000 5A

SETTLING VELOCITY
MARS - A New Instrument for Measuring Phytoplankton Sinking Rate,
W80-04142 7B

SEWAGE BACTERIA
Evaluation of Mound Systems for Purification of Septic Tank Effluent,
W80-04112 5D

SEWAGE DISPOSAL
Inventory and Evaluation of Elevated Sand Mound Sewage Disposal Systems in Pennsylvania,
W80-03912 5D

Environmental Aspects of Ocean Dumping in the Western Gulf of Mexico,
W80-03980 5C

SEWAGE EFFLUENTS
Hydraulic Evaluation of a Mound System in Maine,
W80-03962 5B

Effects of Nonsettleable Biosolids on Stream Organisms,
W80-03991 5C

Survival of Juvenile Spot (Leiostomus xanthurus) Exposed to Bromochlorinated and Chlorinated Sewage in Estuarine Waters,
W80-04008 5A

Status of Oxygen-Activated Sludge Wastewater Treatment.
W80-04170 5D

SEWAGE SLUDGE
Environmental Aspects of Ocean Dumping in the Western Gulf of Mexico,
W80-03980 5C

Mathematical Modeling Predictions of the Geological Effects of Sewage Sludge Dumping on the Continental Shelf,
W80-04073 5C

Distribution of Suspended Particulate Matter Near Sewage Outfalls in Santa Monica Bay, California.
W80-04074 5C

SEWAGE TREATMENT
Land Treatment of Municipal Wastewater Effluents: Case Histories.
W80-04168 5D

Utilization of Natural Ecosystems for Wastewater Renovation.
W80-04188 5D

SEWERAGE
Analysis of Changes in Ground-Water Levels in a Sewered and an Unsewered Area of Nassau County, Long Island, New York.
W80-04099 2F

Optimizing the Benefits of Investments in Sewerage in Developing Countries.
W80-04163 6B

SHATT AL-ARAB RIVER (IRAQ)
Possible Relation Between Phytoplankton Numbers and Saprolegnioid Fungi in Shatt Al-Arab Near Basrah, Iraq,
W80-04119 5F

SHRIMP
Bioeconomic Model of the Gulf of Carpentaria Prawn Fishery,
W80-04199 6B

SILT LOAM SOILS
Spatial Variability of Infiltration in a Watershed,
W80-04062 2G

SIMULATION ANALYSIS
Turbulence and Phytoplankton Diversity: A General Model of the 'Paradox of Plankton',
W80-04138 5C

SLUDGE TREATMENT
Optimized Economic Use of Sludge Treatment Facilities in Durban,
W80-03979 5B

Status of Oxygen-Activated Sludge Wastewater Treatment.
W80-04170 5D

SLURRIES
Quality and Treatment of Water Involved with Coal Slurry Transport by Pipeline,
W80-04108 5D

SMALL WATERSHEDS
A Quantitative Analysis of Streamflow: The Importance of Precipitation and Geomorphic Factors in Determining Yields from Small Watersheds,
W80-04106 6A

SOCIAL ASPECTS
Participation in Water Resources Planning: Leader and Non-Leader Comparisons,
W80-03903 6B

Environmental Problems of Developing Countries,
W80-03969 6E

Wood Pulp, Water Pollution, and Advertising,
W80-03972 6E

Cultural Differences in Perceptions of Environmental Problems,
W80-03973 6B

SOCIAL IMPACT
Recreation at the McClellan-Kerr Arkansas River Navigation System,
W80-04153 6B

SOCIAL VALUES
Environmental Alternatives and Social Goals,
W80-04157 6E

SOIL PROPERTIES
Soil Spatial Variability and Its Consequences on Simulated Water Balance,
W80-03947 2G

Soil Suitability for On-Site Waste Disposal: Development of Genetically Marked Escherichia coli Strains as Tracers of Subsurface Water Flow,
W80-04017 5E

SOIL WATER
Effects of Clearcutting on Soil Water Depletion in an Engelmann Spruce Stand.
W80-04034 4A

Estimating Soil Water Retention Characteristics from Particle Size Distribution, Organic Matter Percent, and Bulk Density.
W80-04038 2G

SOIL WATER MOVEMENT
Field Measurement of Soil Hydraulic Properties Characterizing Water Movement Through Swelling Clay Soils,
W80-03935 2G

The Application of the Gamma Neutron Method for Transport Studies in Field Soils,
W80-04032 2G

SOIL-WATER-PLANT RELATIONSHIPS
Consumptive Use and Yields of Crops in New Mexico,
W80-04107 2D

SOLAR ENERGY
Technical and Economic Evaluation of an MSF Solar Energy Powered Desalination Plant,

SOLID WASTES
Stability of Dredged Material Deposited Seaward of the Columbia River Mouth,
W80-04065 5C

Geologic Effects of Ocean Dumping on the New York Bight Inner Shelf,
W80-04066 5C

SORPTION
Kinetics of Accumulation of Some Radionuclides by Marine Bacteria,
W80-03997 5A

SOUTH FLORIDA
Urban Stormwater Data Management System with Applications to South Florida Studies,
W80-04097 7C

SOUTHWEST ENGLAND
A Case Study of Rationalization of a Rain Gage Network in Southwest England,
W80-04046 2B

SPATIAL DISTRIBUTION
Soil Spatial Variability and Its Consequences on Simulated Water Balance,
W80-03947 2G

Studies on the Plant Community of a North Florida Salt Marsh Part II. Nutritive Value and Decomposition,
W80-03975 5C

The Bacterial Flora of Certain Marine Fishes and Prawns in Cochin Waters in Relation to Their Environs,
W80-03984 5C

Spatial and Temporal Patterns of Temperature, Alkalinity, Dissolved Oxygen and Conductivity in an Oligo-Mesotrophic, Deep-Storage Reservoir in Central Texas,
W80-04135 5C

A Diatom Assemblage Living Below the Surface of Intertidal Sand Flats,
W80-04143 2L

SPECIATION
Skeletonema Potamos (Weber) Hasle and Cyclotella Atomus Hustedt (Bacillariophyceae) in the Plankton of Rivers in England and France,
W80-04120 2I

SPECIES COMPOSITION
Origins of Oceanic Plankton in the Middle Atlantic Blight,
W80-04132 2L

SPECIES DIVERSITY
Turbulence and Phytoplankton Diversity: A General Model of the 'Paradox of Plankton',
W80-04138 5C

SPOT
Survival of Juvenile Spot (Leiostomus xanthurus) Exposed to Bromochlorinated and Chlorinated Sewage in Estuarine Waters,
W80-04008 5A

SPRAY IRRIGATION
Impact of Waste Diversion on Water Quality in Lakes,
W80-04144 3C

SPRINGS
Dumanli Spring, Turkey--The Largest Karstic Spring in the World,
W80-04029 2F

ST LAWRENCE ESTUARY (CANADA)
Ichthyoplankton of the St. Lawrence Estuary: Composition, Distribution, and Abundance,
W80-03965 2H

ST. LAWRENCE RIVER
Characterization of the Water Quality in the Saint Lawrence River: Determination of Homogeneous Zones by Correspondence Analysis,
W80-03955 5A

ST. MARKS (FL)
Studies on the Plant Community of a North Florida Salt Marsh Part II. Nutritive Value and Decomposition,
W80-03975 5C

STATIONS
Statistical Considerations in Network Design,
W80-03942 7A

Use of Principal Component Analysis to Identify Homogeneous Precipitation Stations for Optimal Interpolation,
W80-04048 7A

STATISTICAL METHODS
Statistical Considerations in Network Design,
W80-03942 7A

STATISTICS
An Optimal Sampling Procedure for the Collection of Residential Water Use Data,
W80-03931 6D

Statistical Analysis of Nitrate Concentrations from the River Frome (Dorset) for the Period 1965-76,
W80-04101 5B

STOCHASTIC DESCRIPTION
A Stochastic Description of Wet and Dry Spells in Terms of an Effective Number of Days,
W80-03938 6A

STOCHASTIC PROCESSES
A Stochastic Description of Wet and Dry Spells in Terms of an Effective Number of Days,
W80-03938 6A

Sampling of Interrelated Random Fields: The Rainfall-Runoff Case,
W80-03940 7A

Stochastic Analysis of Steady State Groundwater Flow in a Bounded Domain, 2. Two-Dimensional Simulations,
W80-03949 2F

STORAGE
Thermal Energy Storage in a Confined Aquifer: Experimental Results,
W80-03952 2F

STORM RUNOFF
Storm Travel Distance Calculations for Total Phosphorus and Suspended Materials in Rivers,
W80-03930 5B

STORM WATER
Urban Stormwater Data Management System with Applications to South Florida Studies,
W80-04097 7C

STRATIFICATION
Spatial and Temporal Patterns of Temperature, Alkalinity, Dissolved Oxygen and Conductivity in an Oligo-Mesotrophic, Deep-Storage Reservoir in Central Texas,
W80-04135 5C

STREAMBEDS
In Situ Measurements of Net Primary Production in a Colorado Mountain Stream,
W80-04140 5C

STREAMFLOW
Design of Operational Precipitation and Streamflow Networks for River Forecasting,
W80-03939 7A

The Worth of Streamflow Data in Water Resources Planning: Computational Results,
W80-04019 2E

Application and Analysis of a Coupled Surface and Groundwater Model,
W80-04024 2E

Kriging in the Design of Streamflow Sampling Networks,
W80-04047 7A

Simulated Changes in Ground-Water Levels and Streamflow Resulting from Future Development (1970 to 2020) in the Platte River Basin, Nebraska,
W80-04096 6A

STREAMFLOW FORECASTING
Benefits of Long-Range Streamflow Prediction,
W80-03901 6B

A Quantitative Analysis of Streamflow: The Importance of Precipitation and Geomorphic Factors in Determining Yields from Small Watersheds,
W80-04106 6A

STREAMLINES
Modeling Groundwater Flow Fields Containing Point Singularities: Streamlines, Travel Times, and Breakthrough Curves,
W80-03956 2F

STREAMS
Impact of Road Networks on Southeastern Michigan Lakeshore Drainage,
W80-03951 2E

Effects of Nonsettleable Biosolids on Stream Organisms,
W80-03991 5C

SUBMERGED PLANTS
Chemistry of Water Milfoil Tissue: Seasonal Variation in Submersed Apices,
W80-03910 5A

Distribution and Quantitative Development of Aquatic Macrophytes in Relation to Sediment Characteristics in Oligotrophic Lake Kalgaard, Denmark,
W80-04172 5C

SUBSURFACE FLOW
Soil Suitability for On-Site Waste Disposal: Development of Genetically Marked Escherichia coli Strains as Tracers of Subsurface Water Flow,
W80-04017 5E

SUCCESSION
The Potential Effects of Energy Related Activities on the Seasonal Trajectories of Epiphytic Marine Diatoms,
W80-04125 5C

SULFUR COMPOUNDS
Volatile Organic Sulfides from Freshwater Algae,
W80-04128 5C

SURFACE SEALING
Stabilized Sand Surfaces for Overland Flow Studies,
W80-03945 2E

SURFACE WATER
Benefits of Long-Range Streamflow Prediction,
W80-03901 6B

SURFACE WATERS
Water Resource Uses and Issues in Texas,
W80-03933 7C

Evaluation of Limestone Neutralization of Acidic Adirondack Surface Waters,
W80-03961 2K

Water Resources Data for Oklahoma, Water Year 1978--Volume 1. Arkansas River Basin.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 13, NUMBER 13
JULY 1, 1980

W80-04201 -- W80-04500
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the
Office of Water Research and Technology
U.S. Department of the Interior

VOLUME 13, NUMBER 13
JULY 1, 1980

W80-04201 - W80-04500

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most our our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographic citation and a set of identifiers or descriptors which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Office of Water Research and Technology.

To provide SWRA with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

The input from these Centers, and from the 54 Water Resources Research Institutes administered under the Water Research and Development Act of 1978, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies becomes the information base from which this journal is derived.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology
U.S. Department of the Interior
Washington, D.C. 20240

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

GROUNDWATER TRANSPORT OF A SALT TRACER THROUGH A SANDY LAKEBED,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Biology and Health Physics Div.
D. R. Lee, J. A. Cherry, and J. F. Pickens.
Limnology and Oceanography, Vol 25, No 1, p 45-61, January 1980. 13 Fig, 2 Tab, 35 Ref.

Descriptors: *Mass transfer, *Groundwater movement, *Tracers, *Lakes, *Salts, *Surface-groundwater relationships, *Canada, Dispersion, Advection, Lake beds, Permeability, Shores, Seepage, Sediment-water interfaces, Lake bottom springs, Numerical analysis, Sampling, Electrical conductance, Anisotropy, Hydraulic conductivity, Groundwater transport.

In an investigation of groundwater advection and dispersion in a lakebed, a vertical zone of salt solution was injected between 1.7 and 3 m beneath the shoreline and entered the lake through a large area of lakebed at a reduced concentration. Migration of the tracer pulse and flux to the lake were monitored over a 7 x 8 m area of lakebed by measuring the electrical conductance of water collected from sampling points beneath the lakebed and from seepage meters on the lakebed. The tracer moved horizontally, curved gently upward, and entered the lake through an area of 17 sq m--an area 5.7 times larger than the initial cross-sectional area of the tracer zone. Seepage flux through the sediment-water interface declined exponentially with offshore distance and averaged 240 cu m/yr per meter of shoreline. Results showed that prediction of solute flux from onshore zones of groundwater contamination requires consideration of dispersion (mixing) and the ratio of horizontal to vertical permeability (K sub h:K sub v). Numerical simulations showed that with increasing K sub h:K sub v, tracer- or contaminant-entry areas on the lakebed extend over larger areas and are displaced farther offshore. A K sub h:K sub v of 10 matched the field observations. An analytical model indicated that the observed reduction in peak concentration (a decline to 31% of the initial value over a 6-m flow path) would result from values of longitudinal dispersivity as small as 1 cm. MODELLING AND ANALYSIS OF DATA FROM CATCHMENT STUDIES OF LAND USE CHANGE,
National Research Advisory Council of New Zealand, Wellington.
A. R. Rao, A. I. McKerchar, and A. J. Pearce.
Progress in Water Technology, Vol 11, No 6, p 579-597, 1979. 1 Fig, 40 Ref.

Descriptors: *Watersheds(Basins), *Water quality, *Runoff, *Land use, *Model studies, Mathematical models, Analytical techniques, Regression analysis, Stochastic processes, Hydrology, Hydrographs, Unit hydrographs, Urbanization, Conceptual models, Intervention analysis.

Catchment studies of effects of land use change on water quantity and quality have proliferated in recent years. Careful planning of these studies is necessary to ensure that questions of concern are posed as hypotheses and that the catchments instrumented will provide relevant data for testing the hypotheses. Appropriate analysis methods must be used to establish the significance of observed changes in quantity and quality characteristics. Regression methods have commonly been used but have limited applicability where the variance of the data may have been inhomogeneous. Alternative methods are unit hydrograph studies, conceptual modeling, and stochastic analysis. Unit hydrograph studies have been used to predict changes in storm runoff hydrographs as a result of increased urbanization of catchments. Conceptual models offer an alternative to the control catchment in traditional paired catchment experiments but have not assisted in predicting alterations in discharge resulting from land use change. Recently developed stochastic analysis methods are designed to identify, and to establish the significance of, interventions in stochastic processes. These methods have potential for application, although they are still being developed. (Sims-ISWS)

YIELD AND MACRONUTRIENT CONTENT OF WATER IN RELATION TO PLANT COVER FROM THE SNOW TUSSOCK GRASSLAND ZONE OF EASTERN AND CENTRAL OTAGO, NEW ZEALAND,
Otago Univ., Dunedin (New Zealand). Dept. of Biology.
A. F. Mark, and D. K. Holdsworth.
Progress in Water Technology, Vol 11, No 6, p 449-462, 1979. 2 Fig, 2 Tab, 18 Ref.

Descriptors: *Water yield, *Nutrients, *Vegetation effects, Mountains, Grasses, Water balance, Rainfall, Precipitation(Atmospheric), Evaporation, Storage, Fog, Lysimeters, Water resources, Land use, *New Zealand.

A lysimeter approach to water yield within the high altitude snow tussock grassland zone of eastern and central Otago is demonstrating a significant difference in water yield associated with the type and condition of plant cover. From all but one of six sites within the zone of high altitude snow tussock (above about 750 m) the highest yields were associated with unmodified snow tussock grassland which returns 55-68% of the measured precipitation, substantially more than that yielded by a short turf of blue tussock grassland that frequently replaces mismanaged snow tussock in the region, or even from bare soil. Below this zone, in mixed fescue-snow tussock grassland that has been, or currently is being, converted into higher producing exotic pasture wherever topography permits, water yield under snow tussock from one site, associated with relatively low precipitation, was less than 50% of input and was exceeded by both a blue tussock sward and bare soil. Evidence was produced which indicates that substantial interception gains from fog by the tall fine foliage provided by a snow tussock canopy is the main factor accounting for the increased yield associated with this type of cover at higher altitudes within the region. This moisture source is not available to either a short grass turf or bare soil. Macronutrient levels of both rainfall and leachate associated with the snow tussock cover were presented but as yet are insufficient to compile nutrient budgets. Levels were generally in the range of those reported for natural ecosystems elsewhere. (Sims-ISWS)

THE CALIFORNIA WATER ATLAS.
California Office of Planning and Research, Sacramento.
1978. 124 p, 32 Plates, 4 Fig, 10 Tab, 108 Photo, 143 Ref.

Descriptors: *California, *Maps, *Water resources, *Urbanization, *Colorado River, *Central Valley Project, *Administration, *Water districts, *Water requirements, *Economics, *Industrial water, *Recreation, *Water quality, *Water management(Applied), *Water supply, *Water demand, *Conservation, Meteoric water, River systems, Water storage, Oceans, Flood control, Irrigation, Water rights, Boulder Canyon Project Act, Metropolitan Water Dist. of So. Cal., Federal-state water rights conflicts, Legal aspects, Water rights, Floods, Droughts, Recreational demand, Hydroelectric power, Navigation, Water quality control, Deltas, Demand, Supply, Technology, Water conservation, Data collections, *Sacramento Valley(CA), *Hetch Hetchy Valley(CA), Los Angeles water system.

The atlas was developed to provide the average citizen with a single-volume point of access to understanding how water works in California. It treats every aspect of water supply, delivery, and use in California--the nature of the water environment, the changes mankind has made in that environment, the history of water development, the operation of the major natural and artificial water systems of today, the relationship of water pricing to water consumption, the uses of water in industry, recreation, and energy development, the problems of water quality, and the current and emerging questions of water policy for the future. THE WEATHER REPORT PREDICTS RAIN--AN ESTIMATION OF WHERE, WHEN, AND HOW MUCH RAIN WILL FALL CAN NOW BE DETERMINED BY FREQUENCY ANALYSIS,
New Haven City, CT.
H. F. Goetz, Jr.
Water and Wastes Engineering, Vol 17, No 1, p 39-40, January 1980. 2 Fig, 1 Tab.

Descriptors: *Rainfall, *Design storm, *Frequency, Duration curves, Watersheds(Basins), Rainfall intensity, Precipitation intensity, Storms, Runoff, Drainage, Design, Curves, Frequency curves, Rating curves, Meteorology, Climatology, Time-intensity curves.

Consideration of the total rainfall amount and time period during which the rainfall occurred has resulted in the meteorological rating of storms. The Connecticut Bureau of Highways has compiled and issued a graph of the rainfall frequency curves for Connecticut which establishes relationships between total rainfall, duration of rainfall, and frequency of occurrence. Time-intensity patterns of storms have already been statistically investigated. Intensity-duration graphs, based upon frequency analysis by the method of extreme values, after Gumbel, have been plotted. This type of graph relates three variables--rainfall intensity, return period or frequency, and duration or time of concentration--for the watershed being investigated. These figures reveal that while the storm has only one return period in terms of meteorological data, this same storm results in a number of return periods of varying severity depending upon the time of concentration of the individual shed. Also, since intensity ranking of storms does not consider the areal pattern of the storm, it may not give the same results as obtained from a frequency-discharge curve for the shed. (Sims-ISWS)

SPELLS OF DRY DAYS RELATED TO AGRICULTURAL DROUGHT IN INDIA,
Meteorological Office, Poona (India).
A. Chowdhury, S. S. Gokhale, and G. S. Rentala.
Mausam, Vol 30, No 4, p 501-510, October 1979. 5 Fig, 3 Tab, 7 Ref.

Descriptors: *Droughts, *Rainfall, *Semiarid climates, Dry seasons, Distribution patterns, Precipitation(Atmospheric), Agriculture, Data processing, Statistics, Analytical techniques, Climatology, Weather, Meteorology, *India.

Efficacy of dry spells in identifying drought-prone areas has been advanced in this study. For this purpose, daily rainfall from 1 June to 31 October, which nearly covers all growth phases of crops grown principally during kharif season for a 70-year period (1901-1970), for 26 stations in Maharashtra State, were analyzed. Two types of dry days were classified, namely, a day receiving less than 2.5 mm of rainfall and receiving less than 6.3 mm of rainfall. Dry spells for both categories were computed and analyzed. Similarly, probabilities of occurrence of dry spells of different lengths were analyzed. A theoretical distribution was also fitted to dry spells. The study revealed that logarithmic distribution nearly represents both categories of dry days. Analysis of dry spells and the probabilities confirmed that the hard-core of the drought in Maharashtra State is located over Ahmednagar district. Other areas which possess high degree of drought proneness are eastern parts of Pune, Satara, and Sangli districts and western parts of Sholapur, Aurangabad, and Bhir districts. In the coastal belt of Konkan and eastern parts of Vidarbha, the drought menace is comparatively less. (Sims-ISWS)

STUDY OF NORMAL RAINFALL OF SATARA DISTRICT,
Regional Meteorological Center, Bombay (India).
A. K. Mukherjee, B. Shyamala, and R. Mazumdar.
Mausam, Vol 30, No 4, p 493-500, October 1979. 6 Fig, 4 Tab, 3 Ref.

Descriptors: *Rainfall, *Distribution patterns, *Climatology, Forecasting, Weather forecasting, Precipitation(Atmospheric), Mountains, Elevation, Water resources, Semiarid climates, Statistics, Analytical techniques, Meteorology, Weather, *India, *Satara District(India).

Issue of districtwise Farmers' Weather Bulletin in its present form is too general to be of any specific use to the farmer. It was felt that attempts should be made to improve the Farmers' Weather Bulletins, and a beginning in this direction was made with a detailed study of rainfall characteristics over Madhya Maharashtra. It was often seen that there is wide variation in the intensity and distribution of rainfall even within the same district. A study of such rainfall characteristics of Satara district in south Madhya Maharashtra was undertaken. A rough line of delineation running north-south across the district was suggested which distinguishes the rainfall distribution in the talukas to the west and the talukas to the east. (Sims-ISWS)

ROLE OF TREE-RING ANALYSIS AND RELATED STUDIES IN PALAEO-CLIMATOLOGY: PRELIMINARY SURVEY AND SCOPE FOR INDIAN REGION,
Institute of Tropical Meteorology, Poona (India).
G. B. Pant.
Mausam, Vol 30, No 4, p 439-448, October 1979. 5 Fig, 1 Tab, 30 Ref.

Descriptors: *Dendrochronology, *Climatology, *Trees, *Tropical regions, Forests, Rainfall, Temperature, Semiarid climates, Data processing, Analytical techniques, *India, Dendroclimatology, Tree rings.

The subject of palaeoclimatology and various methods of palaeoclimatological research were introduced as a multidisciplinary approach. The methods of inferring climatological information from the tree-ring analysis and related studies along with relevant details of sample collection and limitations of the method were discussed. Current status of research in dendroclimatology was reviewed and important techniques were summarized. Available literature relating to growth-ring studies for Indian trees was surveyed, and important findings and limitations relevant to planning and establishment of dendroclimatic research in India were discussed. The scope and importance of dendroclimatic research in India in the light of existing information and a complex relationship of tropical climate with the tree-growth characteristics were presented. The trees of Pinus family such as Chir and other conifers along the Himalayan snowline and sub-Himalayan mountains with relatively prominent ring structure were believed to show a significant response to temperature and snowfall. Maintenance of favorable water balance throughout the year for the trees in the regions of scanty rainfall and occasional droughts is essential for their proper growth. Study of the interaction between various climatic factors during the growing season and possible effects of previous seasons on tree growth is essential for orchard owners and forest planners in these regions. Therefore, the urgent need for an intensive study of response of certain tree species in semiarid tropical regions of India to rainfall, in particular the instances of severe droughts, was recommended. The optimum water balance requirements of plant communities can be estimated on the basis of the statistical relationship between the growth parameters and the seasonal rainfall amounts. A comparison of growth parameters of trees from reserve forests and largely inhabited regions of similar climatic zones may bring out much demanded information about the role of forests on the ecological balance. AN EFFECTIVE ANTIFREEZE FOR STORAGE RAINGAUGES,
Ministry of Works and Development, Christchurch (New Zealand), Water and Soil Div.
M. J. McSaveney.
Journal of Hydrology (New Zealand), Vol 18, No 1, p 52-54, 1979.

Descriptors: *Antifreeze, *Rain gages, *Gages, Rain water, Rain, Alcohols, Hydrometers, Rainfall, Temperature, Water, *New Zealand, *Storage rain gages, Commercial antifreeze, Rain gage antifreeze, Methylated spirits, Water-antifreeze solution, Ice needles, Wood alcohol.

Commercial antifreeze will not protect a storage rain gage from freezing: it is too dense and does not mix with rainwater without stirring. The right density for an effective rain gage antifreeze is about 0.995 kg/l, so that the undiluted antifreeze floats between the evaporation-inhibiting oil layer and the water-antifreeze mixture. Such an antifreeze is self-stirring during rain. An antifreeze of this density was made by mixing almost equal quantities of commercial antifreeze and methylated spirits. A slight excess of the latter lighter alcohol was needed, and the correct density was best achieved when a hydrometer was used to test the mixture. The amount of mixture needed for adequate protection must be determined by experience. It varies between gage types and capacities, with rainfall and winter temperature, and even with the frequency of reading. (Roberts-ISWS)

STUDIES OF SILVER IODIDE ICE-FORMING ACTIVITY: VERIFICATION OF THEORY,
Akademiya Nauk SSSR, Novosibirsk. Inst. of Chemical Kinetics and Combustion.
B. Z. Gorbunov, N. A. Kakutkina, and K. P. Koutzenogii.
Journal of Applied Meteorology, Vol 19, No 1, p 71-77, January 1980. 6 Fig, 26 Ref.

Descriptors: *Cloud seeding, *Silver iodide, *Particle size, *Model studies, Mathematical models, Temperature, Air temperature, Weather modification, Precipitation(Atmospheric), Rainfall, Fog, Freezing, Condensation, Crystals, Laboratory tests, Theoretical analysis, Aerosols, Meteorology, Cloud physics.

The dependence of the ice-forming activity on particle radius over the range 50 to 3000 A at fog temperatures of -5, -10, and -20C has been obtained. It was found by diffraction methods that silver iodide particles either have a hexagonal or a cubic low-temperature structure, depending on their size. With these data, the temperature dependences of the threshold particle radius were obtained for hexagonal and cubic modifications of silver iodide. These dependences were compared to theoretical ones obtained by Fletcher for various models of ice formation. It appears that neither the sublimation nor the freezing models describe the experiment. Taking into account the process of water condensation on silver iodide aerosol particles does not improve the situation. A comparison with the Fletcher theory of ice formation on particles with nonuniform surfaces was carried out. It was shown that there are no values of the theoretical parameters which will give a good fit to theory and experiment. (Sims-ISWS)

SYMPOSIUM ON GLACIER BEDS: THE ICE-ROCK INTERFACE.
Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, 1979. 445 p. Glen, J.W., Adie, R.J., Johnson, D.M., Homer, D.R., and MacQueen, A.D., editors. Published by the International Glaciological Society, Cambridge (England).

Descriptors: *Conferences, *Glaciology, *Ice, *Interfaces, *Beds, Reviews, Movement, Glaciers, Remote sensing, Erosion, Glaciohydrology, On-site investigations, Sediments, Physical properties, Melt water, Energy dissipation, Streams, Glaciation, Deformation, Melting, Temperature, Abrasion, Laboratory tests, Model studies, Boundary processes, Ice sheets, Ice-rock interfaces, Regelation.

The symposium objectives were to provide a review of the present (1977) state of knowledge of glacier beds and to report on recent and current work. The subject areas covered were: erosion and deposition processes, the nature of the ice-rock interface, the sliding boundary condition, physical and chemical properties of debris-laden basal ice, remote sensing, physical and chemical processes at the glacier bed, conditions at the base of Pleistocene ice sheets, and subglacial hydrology. PROCESSES OF GLACIER EROSION ON DIFFERENT SUBSTRATA,
University of East Anglia, Norwich (England). School of Environmental Sciences.
G. S. Boulton.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 15-38, 1979. 9 Fig, 42 Ref.

Descriptors: *Glaciation, *Beds, *Boundary processes, *Erosion, *Reviews, Sediments, Shape, Ice, Glaciers, Abrasion, Bedrock, Movement, Analysis, Analytical techniques, Velocity, Theoretical analysis, Model studies, On-site investigations, Interfaces, Rates, Erosion rates, Deformation, Basal ice, Substrata, Sliding, Drumlins, Flutes.

Most theories of glacier movement and subglacial erosion have assumed that glaciers rest on rigid bedrock surfaces. While this is probably correct for much of the bed area of most modern glaciers, deformable sediments do occur beneath them and formed a substantial area of the beds of large ice sheets during glacial periods. Observations and theories were presented and reviewed about the processes of glacier erosion of rock and unlithified

sediment beds both when they are frozen and unfrozen. Erosional bedrock landforms, such as roches moutonnees, indicate two principal subglacial erosional processes, plucking and abrasion. Where supraglacially derived debris is unimportant, plucking provides the tools which abrade the bed, and must be a quantitatively more important process than abrasion, though more localized. Where plucking is suppressed, erosion rates must be slow. Subglacial measurements of abrasion rates beneath a temperate glacier were used to test an earlier abrasional theory. The form of the predicted abrasion-rate curve for changing ice velocity and pressure was verified. This theory successfully simulates two-dimensional erosional bedforms. Subglacial observations demonstrate how flow of basal ice around the flanks of bedrock obstacles causes streaming of debris to occur. It was suggested that this streaming process is primarily responsible for the longitudinally lineated form of large-scale surfaces typical of glacially eroded bedrock. Plucking and abrasion also occur beneath cold ice, though at slow rates, and are probably restricted to places where the ice thickness is small. Where the glacier bed is composed of unlithified sediment, subglacial measurements show that deformation can produce very large discharges of subglacial material, which makes this a potential agent of very rapid subglacial landform production. The heterogeneity of subglacial sediment leads to spatially variable rates of deformation, and it was suggested that relatively stronger parts of the sediment body may form the nuclei for drumlin and mega-flute formation. Whereas unlithified unfrozen sediment deforms beneath the glacier rather than being incorporated within it, ice-cemented subglacial sediments can behave like bedrock, because of their relative rigidity, and are readily plucked and incorporated englacially. They may also deform beneath the glacier. (See also W80-04313) (Humphreys-ISWS)
W80-04314

A THEORETICAL MODEL OF GLACIAL ABRASION,
Stanford Univ., CA. Dept. of Geology.
B. Hallet.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 39-50, 1979. 6 Fig, 17 Ref. NSF EAR77-13631.

Descriptors: *Glaciation, *Abrasion, *Beds, *Model studies, *Boundary processes, Ice, Erosion, Theoretical analysis, Interfaces, Mathematical models, Analytical techniques, Movement, Glaciology, Glaciers, Loads(Forces), Deformation, Melting, Basal ice, Sliding.

Preliminary results of a quantitative model of glacial abrasion were presented. The analysis, which was constructed within a framework of modern glaciological views of processes near to the bed, was aimed at modeling abrasion under a temperate glacier whose basal layers contain only occasional rock fragments. It does not simulate abrasion by debris-rich ice or by subglacial drift. Calculations of abrasion-rates reduce to evaluations of the forces pressing rock fragments against the glacier bed and of the rates at which they are moved along the bed. The estimated viscous drag induced by ice flow toward the bed due to basal melting is generally the dominant contribution to this contact force. Several new results are noteworthy: (1) other parameters being equal, abrasion will tend to be fastest where basal melting is most rapid, (2) glacier thickness does not affect abrasion through its influence on basal pressures, and (3) lodgement of rock fragments is only possible if the sliding velocity is very low, equivalent to the rate of basal melting. (See also W80-04313) (Humphreys-ISWS)
W80-04315

SIMULATED GLACIAL ABRASION,
British Columbia Univ., Vancouver. Dept. of Geological Sciences.
W. H. Mathews.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 51-56, 1979. 2 Fig, 5 Ref.

Descriptors: *Glaciation, *Abrasion, *Laboratory tests, *Model studies, Laboratory equipment, Erosion, Beds, Instrumentation, Boundary processes, Methodology, Loads(Forces), Friction, Friction coefficient.

Glacial abrasion has been simulated by turning a grindstone made of ice and crushed quartz between two stone plates within a domestic deep-freeze. Within limits, the speed of rotation, the normal loading, and the temperature of operation can be controlled. The tangential force exerted on one of the stone plates can be measured. The ratio of tangential to normal force, the effective coefficient of friction, was found to vary with the 'roughness' of the grindstone, to increase gradually as abrasion proceeds, and to increase with decreasing velocity. Even at very low temperatures (to -26C), abrasion products accumulated in a pad of ice frozen to the tablet 'down-stream' from the grindstone, indicating that a water phase at least momentarily exists. The abraded surface of a fine-grained limestone displays grain-from-grain plucking dominating over abrasion of individual crystals. The abraded surface of a granite, by contrast, shows striations of crystals and rupture of cleavage along individual striae. (See also W80-04313) (Humphreys-ISWS)
W80-04316

THE SPECTRAL POWER DENSITY AND SHADOWING FUNCTION OF A GLACIAL MICRORELIEF AT THE DECIMETRE SCALE,
Centre National de la Recherche Scientifique, Grenoble (France). Lab. de Glaciologie.
J-P. Benoist.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 57-66, 1979. 3 Fig, 3 Tab, 15 Ref.

Descriptors: *Glaciation, *Beds, *Topography, Shape, Profiles, On-site investigations, Analytical techniques, Analysis, Shear, Bedrock, Statistical methods, Wavelengths, Measurement, Statistics, Spectral analysis, Spectral power density.

Longitudinal profiles of roches moutonnees were measured once every centimeter over a total length of more than 100 m. Only wavelengths in the range 3.6 cm less than lambda less than 40 cm were kept and analyzed. Levels and their slopes have a symmetrical, non-Gaussian distribution. The spectral power density varies roughly as gamma times nu to the -m power (nu = wavenumber = 1/lambda); n being the same for all the profiles (n = 2.36) and gamma being dependent on the studied area. No significant difference has been found for the shadowing function of the different studied areas. It seems that few parameters can quantitatively describe roches moutonnees; among these are the distribution of slopes and levels, the spectral power density, and the shadowing function. (See also W80-04313) (Humphreys-ISWS)
W80-04317

LOCAL FRICTION LAWS FOR GLACIERS: A CRITICAL REVIEW AND NEW OPENINGS,
Centre National de la Recherche Scientifique, Grenoble (France). Lab. de Glaciologie.
L. Lliboutry.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 67-95, 1979. 8 Fig, 2 Tab, 31 Ref.

Descriptors: *Glaciers, *Friction, *Reviews, *Model studies, *Boundary processes, Velocity, Glaciology, Movement, Mathematical models, Analytical techniques, Theoretical analysis, Bedrock, Beds, Ice, Rheology, Melting, Interfaces, Freezing, Heat balance, Mechanical properties, Viscosity, Drag, *Friction laws, Sliding.

'Sliding velocity' and 'friction law' were precisely defined. Different scales for tackling glacier dynamics were introduced. The energy balance in the melting-refreezing process was clarified. The validity of a Glen body as a model for ice rheology was discussed. The assumed model for subglacial water is a very slightly pervious ice, and a not absolutely watertight ice-bedrock interface, owing to glacial striae and rock joints. Then autonomous hydraulic regimes and cavities at water vapor pressure have a negligible influence on the drag, and only the interconnected regime has to be considered. A more rigorous treatment of Weertman's model (independent knobs) gives quite different numerical factors. In general a term increasing with Terzaghi's effective pressure N has to be added to the drag. The double-valued friction law found by Weertman was shown to have been an error. Kamb's relations for the model with a vanishing microrelief are considerably simplified. His conjectural solution cannot be extended to slopes actually found in the microrelief. The author's (Lliboutry, 1968) treatment was unsatisfactory and included an error. With a model consisting of irregular bumps of similar length, a new friction law was given. The pertinent measure of the bedrock roughness is then the shadowing function, not the spectral power density. (See also W72-02284 and W80-04313) (Humphreys-ISWS)
W80-04318

THE UNSOLVED GENERAL GLACIER SLIDING PROBLEM,
Northwestern Univ., Evanston, IL. Dept. of Materials Science and Engineering.
J. Weertman.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 97-115, 1979. 5 Fig, 73 Ref.

Descriptors: *Glaciology, *Boundary processes, *Reviews, *Theoretical analysis, Movement, Ice, Interfaces, Beds, Surfaces, Analytical techniques, Mathematical models, Erosion, Shape, Creep, Deformation, Rheology, Sliding, Basal ice, Roughness(Beds).

The status of the theory of glacier sliding was reviewed. The theory of Nye and Kamb essentially solves the problem of glacier sliding when the basal ice is in intimate contact with a nondeformable bed, but experimental work is needed on cyclic creep and the regelation process in order to put better numbers into the theory. The outstanding problem that remains to be solved, called in this paper the general glacier sliding problem, is the case of sliding when basal ice is not in intimate contact with a nondeformable bed because of the presence of cavities and a water film of finite thickness. This problem involves solving an intricately coupled basal water-flow problem. A new field of research is the study of the motion of glaciers over deformable beds. (See also W80-04313) (Humphreys-ISWS)
W80-04319

THE FLOW OF ICE, TREATED AS A NEWTONIAN VISCOUS LIQUID, AROUND A CYLINDRICAL OBSTACLE NEAR THE BED OF A GLACIER,
Institute of Hydrology, Wallingford (England).
E. M. Morris.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 117-129, 1979. 2 Fig, 21 Ref, 1 Append.

Descriptors: *Ice, *Flow around objects, *Boundary processes, *Mathematical studies, Glaciology, Viscous flow, Flow, Theoretical analysis, Movement, Equations, Analytical techniques, Fourier analysis, Regelation.

This paper described an analytical solution of the equations of motion and heat conduction for ice flowing around a cylindrical solid inclusion and over a solid plane boundary. This is intended to be a simplified representation of the flow of clean glacier ice around a stone and over a rigid rock bed. The ice is treated as a Newtonian viscous

liquid, and the equations are solved in two dimensions. Regelation boundary conditions are applied at both ice-rock interfaces. It was found that finite solutions for the temperature and stream function only exist for the special cases in which two dimensionless critical wavelengths are zero. That is, unless the stone is very far from the glacial bed, the classical regelation boundary conditions cannot be obeyed over the whole of its surface. (See also W80-04313) (Humphreys-ISWS)
W80-04320

A MATHEMATICAL APPROACH TO THE THEORY OF GLACIER SLIDING,
Trinity Coll., Dublin (Ireland). School of Mathematics.
A. C. Fowler.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 131-141, 1979. 2 Fig, 20 Ref.

Descriptors: *Ice, *Boundary processes, *Mathematical models, *Flow, Glaciology, Theoretical analysis, Analytical techniques, Interfaces, Movement, Viscous flow, Bedrock, Beds, Shape, Equations, Velocity, Mathematical studies, Model studies, Basal ice, Sliding.

Previous theories of glacier sliding are subject to the criticism that they are not properly formulated. This paper described how the basal ice flow may be related to the bulk ice flow by means of the formal mathematical method of matched asymptotic expansions. A complete model of the basal sliding (involving coupled problems in ice, water film, and bedrock) may be rationally reduced by a dimensional analysis to a consideration of the ice flow only, and regelation may be neglected provided roughness is absent on the finest scales (less than 1 mm). If the viscosity is supposed to be independent of the moisture content, then complementary variational principles exist that allow bounds on the drag to be obtained. In particular, these determine the magnitude of the basal velocity in terms of two crucial dimensionless parameters. Arguments were presented as to why realistic sliding laws should be taken as continuous functions of the temperature, and a (major) consequence of this assumption was mentioned. Finally, the effect of cavitation was discussed via an (exact) leading-order solution of the ice flow in the particular case of a Newtonian fluid and a 'small' bedrock slope. SIMULATED GLACIER SLIDING OVER AN OBSTACLE,
Centre National de la Recherche Scientifique, Grenoble (France). Lab. de Glaciologie.
R. Brepson.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 143-156, 1979. 14 Fig, 1 Tab, 13 Ref, 1 Append.

Descriptors: *Model studies, *Glaciers, *Movement, *Laboratory tests, Interfaces, Boundary processes, Ice, Viscometers, Laboratory equipment, Methodology, Glaciology, Drag, Analytical techniques, Petrology, Creep, Strain, Measurement, Shear, Beds, Sliding.

The sliding of temperate ice over two obstacles with sine-wave profiles (wavelength, 0.53 m; maximum slope, 0.22) and low thermal conductivity has been reproduced at full scale within a steel chamber. As expected, large cavities form between the ice and the obstacles so that the drag is limited. However, the delayed elasticity of bubbly ice modifies the expected behavior. At the base of the ice a fine-grained, bubble-free blue ice layer develops. The shear strain concentrates on the upstream side of bumps and in the blue ice layer. Tap-water ions enhance tertiary creep-rates. (See also W80-04313) (Humphreys-ISWS)

EMPIRICAL STUDIES OF ICE SLIDING,
Department of Science, Melbourne, Victoria (Australia). Antarctic Div.
W. F. Budd, P. L. Keage, and N. A. Blundy.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 157-170, 1979. 8 Fig, 2 Tab, 27 Ref.

Descriptors: *Ice, *Boundary processes, *Friction, *Laboratory tests, Interfaces, Glaciology, Methodology, Laboratory equipment, Analytical techniques, Analysis, Velocity, Erosion, Shear stress, Beds, Shape, Measurement, Movement, Rates, Sliding, Normal stress, Basal ice, Friction coefficient.

An experimental program was carried out for studying temperate-ice sliding over rock surfaces with a wide range of roughnesses, for normal and shear stresses comparable to those expected under real ice masses. The limiting static shear stress for acceleration was found to be directly proportional to the normal load giving a constant limiting coefficient of static friction characteristic of the surface. For a constant applied normal stress N and shear stress tau, well below the limiting static shear, a steady velocity V results which increases approximately proportionally to tau and decreases with increasing N and the roughness of the surface. For high normal stress the velocity becomes approximately proportional to the shear stress cubed and inversely proportional to the normal stress. As the shear stress increases, acceleration sets in, which for different roughness and normal loads, tends to occur for a constant value of the product tau times V. For some surfaces at high normal loads this acceleration was retarded by erosion. For constant-applied-velocity tests a steady shear stress resulted, which tended to become constant with high velocities, and which increased with increasing normal stress but with a reduced coefficient of sliding friction. The relevance of the results to the sliding of real ice masses was discussed with particular reference to the importance of the effect of the relative normal stress, above basal water pressure, to the sliding rate. It appears that the results presented can provide the basis for a sliding theory which has relevance to the sliding of ordinary glaciers and also to ice falls, surging glaciers, and fast-outlet polar glaciers. SEISMIC EVIDENCE FOR DISCRETE GLACIER MOTION AT THE ROCK-ICE INTERFACE,
Geological Survey, Menlo Park, CA.
C. S. Weaver, and S. D. Malone.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 171-184, 1979. 8 Fig, 14 Ref.

Descriptors: *Interfaces, *Seismic studies, *Glaciology, *Washington, Ice, Glaciers, Bedrock, Movement, On-site tests, On-site investigations, Avalanches, Seismic waves, Monitoring, Seasonal, Seismic properties, Travel time, Velocity, *Icequakes, Ice-rock interface, Sliding.

Seismic monitoring on three Cascade volcanoes in Washington State has shown that small seismic events are generated by the active glaciers found on each mountain. Detailed seismic experiments have been conducted to investigate the sources for these icequakes. Considerable evidence indicates that the events are the result of a stick-slip type of motion taking place at the bed of the glaciers. The few events the authors have been able to locate had depths comparable with the glaciers' thickness. The similarity of wave form from an explosion at the bottom of a glacier and natural icequakes suggests that the complexity of the seismic wave form is due to the path and not the source. The events exhibit an annual trend with more events being recorded in the summer than during the winter. A tenfold increase in the number of events preceded a large ice avalanche that involved the entire glacier thickness, suggesting that seismic monitoring may be useful in predicting catastrophic ice movements. ON THE ORIGIN OF STRATIFIED DEBRIS IN ICE CORES FROM THE BOTTOM OF THE ANTARCTIC ICE SHEET,
Cold Regions Research and Engineering Lab., Hanover, NH.
A. J. Gow, S. Epstein, and W. Sheehy.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 185-192, 1979. 5 Fig, 11 Ref.

Descriptors: *Antarctic, *Interfaces, *Ice, *Cores, On-site investigations, Analysis, Sediments, Stratigraphy, Petrography, Particle size, Melting, Ice-rock interface, Ice sheets, Ice cores, Basal debris.

Cores from the bottom 4.83 m of the Antarctic ice sheet at Byrd Station contain abundant stratified debris ranging from silt-sized particles to cobbles. The nature and disposition of the debris, together with measurements of the physical properties of the inclosing ice, indicate that this zone of dirt-laden ice originated by 'freezing-in' at the base of the ice sheet. The transition from air-rich glacial ice to ice practically devoid of air coincided precisely with the first appearance of debris in the ice at 4.83 m above the bed. Stable-isotope studies made in conjunction with gas-content measurements also confirm the idea of incorporation of basal debris by freezing of melt water at the ice-rock interface. It is suggested that the absence of air from basal ice may well constitute the most diagnostic test for discriminating between debris incorporated in a melt-refreeze process and debris entrapped by purely mechanical means, e.g., shearing. It was concluded from observations on bottom cores from Byrd Station that 'freezing-in' of basal debris is the major mechanism by which sediment is incorporated into polar ice sheets. THE DEBRIS-LADEN ICE AT THE BOTTOM OF THE GREENLAND ICE SHEET,
State Univ. of New York at Buffalo, Amherst. Ice Core Lab.
S. Herron, and C. C. Langway, Jr.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 193-207, 1979. 5 Fig, 2 Tab, 51 Ref.

Descriptors: *Ice, *Interfaces, *On-site investigations, Stratigraphy, Carbon dioxide, Analysis, Particle size, Shape, Gases, X-ray analysis, Quartz, Kaolinite, Crystals, Argon, *Ice cores, *Greenland, Ice sheets, Debris, Basal ice, Ice texture.

The Camp Century, Greenland, ice core was recovered from a bore hole which extended 1375 m from the surface of the Greenland ice sheet to the ice/subice interface. The bottom 15.7 m of the core contain over 300 alternating bands of clear and debris-laden ice. The size of the included debris ranges from particles less than 2 micrometers in diameter to particle aggregates which are a maximum of 3 cm in diameter: the average debris concentration is 0.24% by weight. The debris size, concentration, and composition indicate that the debris originates from the till-like material directly below the debris-laden ice. The total gas concentration averages 51 ml/kg ice compared to the average of 101 ml/kg ice for the top 1340 m. The gas composition of debris-bearing ice has apparently been modified by the oxidation of methane as reflected by traces of methane, high CO2 levels, and low O2 levels with respect to atmospheric air. Argon, which is not affected by the oxidation, shows an enrichment in samples with lower gas concentrations. Both the low gas concentration in the debris-laden zone and the argon enrichment may be explained by the downward diffusion of gases from bubbly glacier ice into an originally bubble-free zone of refrozen debris-laden ice. Ice texture and ice-fabric analyses reveal extremely

fine-grained ice and highly preferred crystal orientation in the lowermost 10 m of the core, indicating a zone of high deformation. (See also W80-04313) (Humphreys-ISWS)
W80-04326

DISCONTINUOUS FLOW, ICE TEXTURE, AND DIRT CONTENT IN THE BASAL LAYERS OF THE DEVON ISLAND ICE CAP,
Department of Energy, Mines and Resources, Ottawa (Ontario). Polar Continental Shelf Project.
R. M. Koerner, and D. A. Fisher.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 209-222, 1979. 6 Fig, 1 Tab, 24 Ref.

Descriptors: *Ice, *Soils, *Beds, Analysis, Crystals, Bedrock, Flow, Stratigraphy, Particle size, Oxygen isotopes, *Ice cores, *Devon Island, Basal ice, Ice texture, Ice cap.

Surface-to-bedrock cores obtained with a CRREL thermal drill were taken in 1972 and 1973 from the top of the Devon Island ice cap. There are very pronounced variations in oxygen isotope, microparticle concentration, and ice texture in the lower-most 5 m of the core. There is a section of isotopically cold, very fine bubbly ice with high microparticle concentrations between 2.6 and 4.4 m above the bed, considered to represent the Last Ice Age. There is coarse, isotopically warm, clean ice above and below this. For 1.2 m above the bed, the ice is finer again with high microparticle concentrations, but it shows very low bubble concentration and is isotopically the warmest in the core. While the broad variations are common to both cores, in detail there are significant variations despite the fact that the cores were taken only 27 m apart. The variations, when analyzed statistically, show that at least 25-30% of the originally continuous profile is missing from each core. Faulting within the near-bedrock ice may be responsible for some of the effect, but bubble fabric also gives evidence for irregular nonlaminar flow. Because of the strong relationship between crystal size and microparticle concentrations in the Devon Island cores, it is suggested that the fine-grained nature of dirty layers in the Antarctic and Greenland ice sheets is due to the effect of the dirt inclusions and not of shearing. Steep isotopic gradients in the Devon Island cores are shown to be evidence for possible shearing, which does not effect any change in the crystal texture. Clear ice near the bed is considered a tectonic feature, but the lack of effect on its bed by the ice cap confirms the nonerosional nature of an ice cap frozen to its bed. In terms of paleoclimatic history, it means that, because of bedrock effects, ice caps of intermediate depth (i.e., less than 400 m) can give continuous information only over the last approximate 5000 years. Between 5000 and 10,000 B.P., the time series becomes slightly discontinuous and beyond 10,000 B.P. so discontinuous as to allow only broad climatic inferences to be drawn. DEPOLARIZATION OF RADIO WAVES CAN DISTINGUISH BETWEEN FLOATING AND GROUNDED ICE SHEETS,
Natural Environment Research Council, Cambridge (England). British Antarctic Survey.
A. H. W. Woodruff, and C. S. M. Doake.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 223-232, 1979. 2 Fig, 1 Tab, 17 Ref.

Descriptors: *Ice, *On-site investigations, *Remote sensing, *Antarctic, Radio waves, Sounding, Analytical techniques, Analysis, Electromagnetic waves, Anisotropy, Beds, Surveys, Methodology, On-site tests, Movement, Floating, Ice sheets, Grounded ice, Ice shelf, Echo sounding, Ice thickness.

Polar ice is now thought to be marginally birefringent at radio echo-sounding frequencies. An experiment on the polarization behavior of 60 MHz radio echoes from the bed of both ice shelf and land ice in Antarctica showed a marked difference in the returned polarization. It appears that differences in electrical properties or roughness of the reflecting boundary cannot explain the results. It is suggested that there is a large change in the birefringence of the ice sheet at the hinge zone, caused by the effect of tidal strain on crystal orientation. This would imply a minimum value of the radio-frequency anisotropy in permittivity for the single crystal of (0.52 + or - 0.8)%; therefore, polarization changes could allow floating and grounded ice to be distinguished. ENERGY DISSIPATION DURING SUBGLACIAL ABRASION AT NISQUALLY GLACIER, WASHINGTON, U.S.A.,
Washington Univ., Seattle. Geophysics Program.
R. C. Metcalf.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 233-246, 1979. 3 Fig, 3 Tab, 35 Ref.

Descriptors: *Glaciers, *Abrasion, *Energy, *Washington, On-site investigations, Sediments, Glacial sediments, Melt water, Ice, Scour, Erosion, Rocks, Model studies, Mathematical models, Glaciology, *Nisqually Glacier(WA).

This study examined the effect of subglacial abrasion on the basal sliding term of the gravitational energy balance of the dynamic, temperate Nisqually Glacier on Mount Rainier, Washington. Subglacial water flux was estimated as 3 x 10 to the 7th power cu m/yr and suspended sediment flux as 3 x 10 to the 7th power kg/yr. Suspended-sediment flux was assumed to represent, within an order of magnitude, the annual mass eroded by subglacial abrasion. Subglacial abrasion involves both brittle fracture and plastic deformation. Field observations of bas-relief and grooved depression striations appear to have exact counterparts in rock mechanics experiments approximating subglacial velocities and normal stresses. Boulton's abrasion model and a new attritivity model proposed herein were shown to predict subglacial abrasion-rates within the limits of natural variability and the error range of measurements. The first crude gravitational energy balance for lower Nisqually Glacier (1.96 sq km) was attempted and probably has only order-of-magnitude accuracy. The importance of subglacial abrasion in dissipating basal sliding energy at Nisqually Glacier was confirmed. (See also W80-04313) (Sims-ISWS)

SEDIMENT CONCENTRATION IN MELT WATERS AS AN INDICATOR OF EROSION PROCESSES BENEATH AN ALPINE GLACIER,
Manchester Univ. (England). Dept. of Geography.
D. N. Collins.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 247-257, 1979. 5 Fig, 1 Tab, 12 Ref.

Descriptors: *Sediments, *Melt water, *Glaciers, Sampling, On-site investigations, Suspended solids, Discharge(Water), Ablation, Variability, Sediment transport, Erosion, Data processing, Sedimentology, Glaciology, *Gornera Glacier(Switzerland).

Suspended-sediment concentrations in melt waters from the Gornera, Gornergletscher, Switzerland, were determined at hourly intervals for periods during the ablation seasons of 1974 and 1975. Rapid erratic fluctuations of suspended-sediment concentration produced peaks which occurred both before and after highest daily flows. Clockwise daily hysteresis rating loops between sediment concentration and discharge included many involutions. Suspended-sediment concentration-discharge rating curves were different for rising and falling limbs of individual diurnal hydrographs and varied from day to day. Close-interval measurements of sediment concentration and discharge records allow interpretation of the nature of ice-water-sediment interactions at the bed of an Alpine glacier. At Gornergletscher, subglacial sediment is delivered to melt waters flowing in the smaller basal conduits, which often change course suddenly, entraining unworked sediment stored at the bed. During diurnal discharge maxima, sediment concentration in the Gornera is reduced because the rate of increase of water volume outstrips the rate of supply of sediment. The drainage of the ice-dammed lake Gornersee, producing exceptionally high flows, extended the drainage network over large areas of the glacier bed, and evacuated much sediment. PRESSURE-MELTING EFFECTS IN BASAL ICE OF TEMPERATE GLACIERS: LABORATORY STUDIES AND FIELD OBSERVATIONS UNDER GLACIER D'ARGENTIERE,
Cambridge Univ. (England). Cavendish Lab.
D. J. Goodman, G. C. P. King, D. H. M. Millar, and G. de Q. Robin.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 259-271, 1979. 7 Fig, 13 Ref, 1 Append.

Descriptors: *Ice, *Glaciers, *Pressure, *Melting, Laboratory tests, On-site investigations, Strain gages, Bedrock, Heat flow, Temperature, Freezing, Glaciology, *Glacier d'Argentiere(France), Regelation.

The suggestion that patches of basal ice may freeze to the bed of a glacier due to certain regelation effects has been tested in the laboratory by applying high hydrostatic pressures to ice samples at the pressure-melting point. During compression, ice temperatures follow the pressure-melting point closely, but after rapid decompression the ice temperature at first returns only half to three-quarters of the way to the pressure-melting point, after which it appears to warm by thermal conduction from outside the ice sample. If the moving ice at the base of a glacier behaves in the same way as it is exposed to changing pressure fields, frozen patches at bedrock are to be expected. Records of strain variations in a tunnel beneath Glacier d'Argentiere show two types of strain events. The first is a rapid jump or offset in the recorded strain, while the second are strain excursions, initiated by a change in strain over a period up to ten seconds, followed by a gradual recovery to the original strain over some minutes. It was suggested that the offset events are due to nearby stress release due to fracturing of frozen patches of ice at the bedrock, while the strain-excursion events show the more distant adjustment of the glacial bed to the former events due to the time lags associated with changes of water-film thickness and regelation heat flow. (See also W80-04313) (Sims-ISWS)

OBSERVATIONS WITHIN CAVITIES AT THE BED OF THE GLACIER OSTERDALSISEN, NORWAY,
Manchester Univ. (England). Dept. of Geography.
W. H. Theakstone.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 273-281, 1979. 4 Fig, 28 Ref.

Descriptors: *Glaciers, *Ice, *Movement, Deformation, Plastic deformation, Temperature, Strain, Bedrock, Rocks, Glaciology, *Glacier Osterdalsisen(Norway), Subglacial cavities, Regelation, Basal ice.

Basal ice at the glacier Osterdalsisen commonly deforms under stress within cavities at the glacier bed. Some ice subject to rapid strain, however, fails in a brittle manner. The creep-rate of basal ice is influenced by sediment particles within it, and by ice grain-size and structural anisotropy; a flow law for such ice has not been derived experimentally.

Near the glacier bed, particles enclosed in ice may migrate as a result of stress concentration, bubbles may be flattened, and anisotropic structures may develop. Recrystallization leads to grain-size changes. Both regelation spicules and layers of regelation ice, generally thin, form within subglacial cavities, but their occurrence is limited. Regelation-ice formation has a significant influence on the distribution of rock debris at the ceilings of subglacial cavities. (See also W80-04313) (Sims-ISWS)
W80-04332

A SEQUENCE OF GLACIAL DEFORMATION, EROSION, AND DEPOSITION AT THE ICE-ROCK INTERFACE DURING THE LAST GLACIATION: CRANBROOK, BRITISH COLUMBIA, CANADA,
University of Western Ontario, London. Dept. of Geology.
B. E. Broster, A. Dreimanis, and J. C. White.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 283-295, 1979. 7 Fig, 1 Tab, 12 Ref.

Descriptors: *Bedrock, *Glaciation, *Geomorphology, *Canada, Deformation, Plastic deformation, Erosion, Deposition(Sediments), Rocks, Till, On-site investigations, Geology, Ice, Fractures(Geologic), Glaciers, Glaciology, *British Columbia.

A comparison of bedrock fractures with orientation of structures and fabric in the overlying late Pleistocene basal till indicated a sequence of common glacial origin. The deformations in bedrock and till, and the deposition of the till layer, were accomplished by two glacial flows that were part of a mountain ice sheet: the regional (moving south-south-east) and the local (moving south-south-west) along Peavine Valley. The following sequence of events was postulated from this investigation: the initial glacial advance from the north-north-west that produced conjugate low-angle shear fractures in the bedrock was followed by competition of both the regional and the Peavine Valley glacial flows which also produced low-angle fracture systems. As the over-riding ice became thicker, high-angle conjugate fractures were formed by both glacial flows. Subsequently, south-east-dripping injection wedges were formed by the regional ice, which was concurrently eroding the down-glacier parts of the wedged blocks, depositing local till, and producing sigmoidal deformations in this till. The main deposition of the overlying lodgement till was accomplished by an interaction of both the regional and the Peavine Valley glacial flows, and the lodgement was supplemented by shearing of the till, producing fissility. Bedrock wedging, as a significant process of glacial erosion, is believed to be discussed here for the first time. (See also W80-04313) (Sims-ISWS)

GIANT GROOVES MADE BY CONCENTRATED BASAL ICE STREAMS,
Ohio State Univ. Research Foundation, Columbus. Inst. of Polar Studies.
R. P. Goldthwait.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 297-307, 1979. 6 Fig, 21 Ref.

Descriptors: *Glaciation, *Erosion, *On-site investigation, *Ohio, Bedrock, Ice, Streams, Beds, Abrasion, Analysis, Surveys, Land forming, Geomorphology, *Kelleys Island(OH), Basal ice, Ice sheets, Glacial grooves, Flutes.

Glacial grooves are known on all the flat-lying limestone islands in western Lake Erie. The largest megagroove complexes are on Kelleys Island, each 2-6 m deep, 5-20 m wide, and 100-400 m long before quarrying. Each megagroove floor is rolling with second-order rounded ridges and 'sine-shaped' grooves 10-90 cm deep and 5-40 m long. Furthermore, these are gouged laterally by sharply curving and nesting gouges up to 10 cm deep. All grooves exhibit third-order striation up to 1-2 mm deep and 5-200 cm long made by individual tools of debris traveling mostly 240-260 degrees. Ice of the Erie lobe was under compressive flow as it rose from 9 m below present lake level to 12 m above. Some sort of ice vortices (fixed eddies in the basal ice stream) are postulated to make the scoop marks and ridge ends. Fast-moving ice rather than water or a slurry is favored because there are no percussion marks. Very likely, a till mat of interfering engraving points is required. A strong convergence (2x to 10x) of striae into the deepest grooves indicates squeezing together of the debris tools and increase in local ice velocity. Interglacial subareal streams may well have shaped the initial trough up which these ice streams concentrated, because dendritic tributary grooves intersect, and main groove sets curve as much as 10 degrees or 20 degrees. Furthermore, sharp 100-180 degrees meander curves are preserved at the bottom of the deepest grooves. Hiram-age clay-till with rare erratics half fills the original grooves; it shows that this groove cutting was completed before 15,500 14C years ago. (See also W80-04313) (Humphreys-ISWS)

DIRECT MEASUREMENT OF BASAL WATER PRESSURES: PROGRESS AND PROBLEMS,
Geological Survey, Tacoma, WA. Water Resources Div.
S. M. Hodge.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 309-319, 1979. 2 Fig, 12 Ref.

Descriptors: *Glaciers, *Boreholes, *Water pressure, On-site investigations, Measurement, Drilling, Drill holes, Pressure, Water levels, Glaciology, *South Cascade Glacier(WA), *Blue Glacier(WA), Basal water, Subglacial water.

In 1975 and 1977, 24 bore holes were drilled to the bed of South Cascade Glacier, Washington, using both electrothermal and hot-water drills. Only two holes connected directly with the basal water system, a significant decrease from the four to five such connections in 13 holes drilled in 1973 and 1974. Most of the bed, possibly as much as 90%, appears to be hydraulically inactive and isolated from a few active subglacial conduits. Bore holes which penetrate these inactive areas initially should connect eventually with the active basal water system due to bed pressurization by the water standing in the bore hole, provided there is a sufficient supply of water available to form and maintain the connection passageway. These sealed-off areas probably consist of the subsole drift and permeability barriers found recently at the bed of Blue Glacier; an increase in the area of bed covered by these features probably caused the decrease in chance of bore-hole connection. This apparently was not due to any external cause but rather was the result of a real internal change in the subglacial hydraulic system which occurred between 1974 and 1975. If most of the area of a glacier bed is hydraulically isolated subsole drift, or something similar, such features may well control large-scale glacier sliding changes, since changes in the amount of water having access to the glacier bed will take considerable time to affect the interstitial water pressure in the more widespread subsole drift. Water pressures in the active part of the basal water system of South Cascade Glacier are generally in the range of 50-75% of the ice overburden pressure. Water levels in a connected bore hole are probably representative over an area of the bed 100 m or more in extent. A correlation of bore-hole water levels with changes in surface motion supports the idea that the sliding of a temperate glacier is controlled largely by the basal water pressure. SUBGLACIAL REGELATION WATER FILM,
Stanford Univ., CA. Dept. of Geology.
B. Hallet.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 321-334, 1979. 5 Fig, 41 Ref. NSF EAR77-13631.

Descriptors: *Glaciers, *Chemical precipitation, *Carbonates, *Calcite, Bedrock, Films, Chemical analysis, Geomorphology, Variability, Temporal distribution, Spatial distribution, Glaciology, Regelation, Basal water.

Recent studies of subglacially precipitated carbonate deposits and associated solutional furrows have provided interesting new insight on subglacial water films, as well as on chemical exchange at the glacier bed. Considerable information on the film thickness and its temporal and spatial variability has been gained by analyzing several properties of subglacial carbonate deposits including: (1) the morphology of surface features aligned parallel to ice flow, (2) the laminated structure, and (3) the size distribution of fine rock fragments presumably transported in the film prior to their incorporation in the deposits. Chemical analyses of water from pro-glacial streams, together with calculations of CaCO3 solubility and mass balance, showed that the channelized water is chemically distinct from the film water in which CaCO3 precipitates, and that subglacial precipitation is not possible where there is a considerable water flux through the film in excess of that associated with regelation sliding. The principal implication of these studies was that a temperate cirque glacier is characteristically separated from its bed by a thin water film, probably micrometers in thickness; however, the film appears to occasionally thicken, at least locally by as much as a hundredfold in exceptional cases. Furthermore, the water flux and/or solute concentration in the basal film undergoes periodic, probably seasonal, variations possibly related to variations in the amount of water reaching and flowing through the basal film. GEOMETRY OF FORMER SUBGLACIAL WATER CHANNELS AND CAVITIES,
Stanford Univ., CA. Dept. of Geology.
J. Walder, and B. Hallet.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 335-346, 1979. 8 Fig, 31 Ref. NSF EAR77-13631.

Descriptors: *Glaciers, *Bedrock, *Abrasion, *Erosion, Flow, Rocks, Chemical precipitation, Mapping, Geology, Scour, Glaciology, Basal ice, Basal water, Cavities.

The spatial pattern of the formerly active processes of water flow, cavitation, abrasion, dissolution, and precipitation at the base of a small cirque glacier has been reconstructed by detailed mapping of surficial features on recently deglaciated limestone bedrock near the glacier terminus. Interpretation of these features, which reflect basal conditions averaged over a period of several or several tens of years, leads to the following conclusions: (1) A nearly continuous, nonarborescent network of cavities and incised channels existed and probably acted as the primary drainage of melt waters. This network evolved through time as many channels were filled, perhaps intermittently, by basal ice. (2) At least 20% of the glacier sole was separated from the bed by water-filled cavities. The rest of the glacier-rock interface characteristically comprises a very thin water film. (3) Abrasion was locally intensified, relative to chemical alteration, in 5-10 m wide zones paralleling the ice-flow direction, perhaps as a result of locally enhanced sheet flow of subglacial water. QUANTITATIVE DETERMINATION OF THE SUBGLACIAL HYDROLOGY OF TWO ALPINE GLACIERS,
Manchester Univ. (England). Dept. of Geography.
D. N. Collins.
In: Symposium on Glacier Beds: The Ice-Rock

Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 347-362, 1979. 5 Fig, 2 Tab, 30 Ref.

Descriptors: *Glaciers, *Hydrology, *Flow, *Discharge(Water), Melt water, Water chemistry, On-site investigations, Model studies, Mathematical models, Sediments, Electrical conductance, Hydrographs, Glaciology, Subglacial hydrology, Flow components.

Two components of discharge through the internal hydrological systems of Alpine glaciers were separated on the basis of chemical composition of water. Some surface melt waters retain low solute contents after flowing without delay through conduits in which no chemical enrichment occurs, whereas those flowing slowly at the glacier bed have increased ionic concentrations. A simple mixing model was used to investigate temporal variations in the quantities of water routed through each of the two subsystems. Electrical conductivity was taken as an indicator of melt-water composition and was monitored for periods during the summer ablation season of 1975 at Gornergletscher and of 1977 at Findelengletscher. At both glaciers, conductivity of melt waters varied diurnally inversely with discharge fluctuations, depending on the proportion of total discharge routed through the two subsystems. Total discharge and the flow component routed rapidly through conduits within the glacier, a large proportion (50-80%) of total discharge, exhibited in-phase rhythmic diurnal hydrographs at the two glaciers. Distinctive subglacial hydrological regimes were contrasted. At Findelengletscher, the hydrographs of total discharge and of subglacial chemically enriched flow were in phase. At Gornergletscher, the subglacial hydrograph occurred with reverse asymmetry and out of phase. A possible interpretation is that water was temporarily stored in basal cavities during high total discharge. During the night, stored water was released, contributing much of the total discharge at times of low flow. (See also W80-04313) (Sims-ISWS)

SUBGLACIAL CONSTRUCTIONS AND INVESTIGATIONS AT BONDHUSBREEN, NORWAY,
Norges Vassdrags- og Elektrisitetsvesen, Oslo.
B. Wold, and G. Ostrem.
In: Symposium on Glacier Beds: The Ice-Rock Interface, Proceedings of a Symposium held at Carleton University, Ottawa (Ontario), August 15-19, 1978. Journal of Glaciology, Vol 23, No 89, p 363-379, 1979. 12 Fig, 2 Tab, 8 Ref.

Descriptors: *Glaciers, *Drainage, *Construction, *Tunnel construction, Ice, Bedrock, Rocks, Till, Tunnels, Tunneling, Flow, Discharge(Water), Hydrology, Glaciology, Subglacial water, Subglacial water intakes, Basal ice, Basal water.

For the construction of a hydroelectric power station in western Norway, a diversion tunnel was made to collect subglacial melt water under an outlet glacier from the Folgefonni ice cap. Many investigations were carried out by glaciologists and engineers before the project could begin, and several unexpected problems arose during the completion of the project. This paper dealt with some of the problems and how they were solved. To avoid coarse glacier-carried material from being flushed into the water-collecting tunnel system, a large sedimentation chamber was constructed in the bedrock under the glacier. The dimensions of this huge chamber were decided from sediment-transport studies in the glacier stream and from studies of old bottom deposits in a lake close to the glacier front. Ice-velocity measurements were made on the glacier surface, and similar studies were attempted in subglacial ice caves made by spraying hot water near the glacier bed, where the ice is 170 m thick. The subglacial water-drainage system was studied from a horizontal tunnel constructed in the bedrock under the glacier. Some preliminary conclusions were drawn from these studies. In future, it will still be possible to undertake subglacial studies because inspection tunnels have been left in the bedrock, and the accessibility is relatively good. 2D. Evaporation and Transpiration

ESTIMATES OF LAKE ST. CLAIR EVAPORATION,
National Oceanic and Atmospheric Administration, Ann Arbor. MI. Great Lakes Environmental Research Lab.
J. A. Derecki.
Journal of Great Lakes Research, Vol 5, No 2, p 216-220, 1979. 4 Fig, 1 Tab, 10 Ref.

Descriptors: *Evaporation, *Lakes, *Mass transfer, *Estimating, Equations, Temperature, Air temperature, Winds, Humidity, Ice cover, Estimating equations, Water temperature, *Lake St. Clair.

Monthly evaporation from Lake St. Clair was determined for individual years of a 26-year period, 1950-75, by the mass transfer method applied to available land-based data adjusted to overwater conditions. Because of extensive ice cover on the lake, the overwater mass transfer results were adjusted for the effect of ice cover during winter. The ice-cover adjustment reduced the average annual evaporation by 100 mm to 750 mm. The mass transfer method is the only technique that permits operational evaporation estimates from this lake with presently available data, and it is also the approach most amenable to future improvements. ASSESSMENT OF THE QUALITY OF GENERALIZED WIND FUNCTIONS IN PENMAN'S EQUATIONS,
Dar es Salaam (Tanzania). Dept. of Physics.
C. J. Stigter.
Journal of Hydrology, Vol 45, No 3/4, p 321-331, February 1980. 2 Tab, 29 Ref.

Descriptors: *Winds, *Equations, *Mass transfer, Evaporation, Atmosphere, Water management(Applied), Agriculture, Management, Meteorological data, *Wind functions, *Penman's equations, Bulk mass transfer, Evaporating surface, Potential evaporation, Crop evaporation, Atmospheric instability, Water management problems.

A simplification of the aerodynamical expression for bulk mass transfer over a rough evaporating surface was used to assess the quality of generalized empirical statistical wind functions in Penman's equations. It was shown that Penman's revised wind function for the open water case was good enough to be preferred over any attempt for more adaptations. It was also shown that for the case of potential evaporation, or reference crop evaporation, a recent approach by Doorenbos and Pruitt formed an appreciable improvement. Comparison with another generalization by Thom and Oliver showed that the generalized wind functions preferred held also under conditions of atmospheric instability. Limitations were discussed for using reference crop evaporation formulas with only a generalized wind function in agricultural water management problems. (See also W77-09953) (Roberts-ISWS)

EVAPORATION FROM VEGETATION IN LANDSCAPES DEVELOPING SECONDARY SALINITY USING THE VENTILATED-CHAMBER TECHNIQUE, II. EVAPORATION FROM ATRIPLEX PLANTATIONS OVER A SHALLOW SALINE WATER TABLE,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Land Resources Management.
E. A. N. Greenwood, and J. D. Beresford.
Journal of Hydrology, Vol 45, No 3/4, p 313-319, February 1980. 5 Fig, 4 Ref.

Descriptors: *Evaporation, *Vegetation, *Landscaping, Salinity, Soils, Plant populations, Groundwater, Water table, Transpiration, Shrubs, *Landscapes, *Secondary salinity, Ventilated-chamber technique, Ungrazed plantations, Bare soils, Groundwater levels, Plots, Nocturnal transpiration.

Daytime evaporation from ungrazed plantations of Attriplex vesicaria, of varying spacing between bushes, was determined during summer. Daily evaporation from individual bushes, plus 1 sq m of surrounding soil, declined significantly with increasing closeness of planting (3.3-1.3 mm/d). Evaporation from bare soil between plants was not affected by spacing and averaged 0.4 mm/d. The integration of these two sources of evaporation showed that total evaporation significantly increased with closeness of spacing from 0.7 to 1.3 mm/d. The increase in evaporation was reflected in groundwater levels measured at the center of each plot throughout the summer. The water table under plots with the closest spacing was 10-20 cm deeper (P less than 0.05) than under the widest spacing. This suggested that Atriplex may have a hydrologic role in saltland reclamation in addition to its value as a grazing plant. There was evidence of a low rate of nocturnal transpiration. (Roberts-ISWS)
W80-04273

SUITABILITY OF REGION-WIDE IRRIGATION SCHEDULING BY LOCAL EVAPOTRANSPIRATION MEASUREMENT,
Nebraska Univ. Panhandle Station at Scottsbluff.
W. L. Trimmer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-169360, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Center, University of Nebraska, Project Completion Report, March 1980. OWRT A-050-NEB (1), 14-34-0001-9029.

Descriptors: *Irrigation scheduling, *Evapotranspiration, *Irrigation design, *Irrigation efficiency, Model studies, Analytical techniques, Instrumentation, Climatology.

Irrigation scheduling requires an estimate of evapotranspiration (ET) to provide a means of determining when to irrigate and with how much water. Measuring ET or crop water use at every site is too expensive. Three sites in the Nebraska Panhandle were chosen as measurement sites. The three formed a triangle approximately 95 km on a side and represented three distinct different climates. Three years ET data for June through August showed relatively little difference between the sites. Norman instrument error explained a great deal of the variation. Instrument calibration, including hygrothermographs and silicon cell pyranometers, proved difficult and illustrated that the fewest number of measurement sites was optimum. Poor calibration can account for far greater differences than climatological differences within a 100-km radius given no great orographic, elevation or micrometeorological differences in location.

2E. Streamflow and Runoff

RUNOFF CURVE NUMBERS FROM PARTIAL AREA WATERSHEDS,
Utah State Univ., Logan. Dept. of Civil and Environmental Engineering.
R. H. Hawkins.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 105, No IR4, Proceedings Paper 15024, p 375-389, December 1979. 10 Fig, 2 Tab, 14 Ref, 2 Append.

Descriptors: *Runoff coefficient, *Storms, *Surface runoff, *Watersheds(Basins), Methodology, Hydrology, Hydrologic data, Analytical techniques, Infiltration rates, Antecedent moisture content, *Runoff curve numbers, *Potential site retention, Small watersheds, Initial abstraction.

Runoff curve numbers are coefficients used in a technique for estimating surface runoff from rainstorms. Analyses of rainfall-runoff events for small watersheds (60 to 4200 acres) in Arizona, Colorado, Utah, and Wyoming show that the curve number decreases with increase in storm rainfall, approximating the runoff as a simple fraction of the

rainfall. This strongly suggests a constant 'impervious' runoff-source area, like channel interception, accompanied by high infiltration rates relative to storm intensity and a constant role for antecedent moisture (uniformly dry). However, extremes in storm intensity or watershed wetness may invoke other processes. (Singh-ISWS)

APPROXIMATE FLOOD ROUTING METHODS: A REVIEW,
Victoria State Rivers and Water Supply Commission, Armadale (Australia).
P. E. Weinmann, and E. M. Laurenson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 105, No HY12, Proceedings Paper 15057, p 1521-1536, December 1979. 5 Fig, 1 Tab, 16 Ref, 2 Append.

Descriptors: *Flood routing, *Model studies, *Open channel flow, *Unsteady flow, Hydraulics, Hydrology, Analytical techniques, Numerical analysis, Rating curves, Hydraulic models, *Finite difference method, *Kinematic wave models, Dynamic effects.

Some well-known approximate flood routing models, including diffusion analogy models, kinematic wave models, and various extensions of the storage routing methods, were reviewed in the light of their theoretical background. A class of kinematic models was identified, and close relationships among many superficially diverse models were demonstrated. Limits of application for different groups of models were indicated, and some emphasis was placed on the analyses of parameter selection procedures. Attention was drawn to the kinematic model corrected for dynamic effects, a generalized model developed recently by Koussis. It covers the widest range of practical applications, excluding only cases where dynamic effects or downstream disturbances play a major role. Other features were reviewed which make the Koussis model an ideal framework for the development of generalized computer programs for approximate flood routing computations. (Singh-ISWS)

THE RIVER CONTINUUM CONCEPT,
Academy of Natural Sciences of Philadelphia, Avondale, PA. Stroud Water Research Center.
R. L. Vannote, G. W. Minshall, K. W. Cummins, J. R. Sedell, and C. E. Cushing.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, No 1, p 130-137, January 1980. 2 Fig, 38 Ref. NSF BMS75-07333, DEB78-11671.

Descriptors: *Rivers, *Ecosystems, *Geomorphology, *Biological communities, Biology, Biomass, Invertebrates, Aquatic microbiology, Streams, Streamflow, Environment, Aquatic environment, River continuum, Ecosystem stability, River zonation.

From headwaters to mouth, the physical variables within a river system present a continuous gradient of physical conditions. This gradient should elicit a series of responses within the constituent populations resulting in a continuum of biotic adjustments and consistent patterns of loading, transport, utilization, and storage of organic matter along the length of a river. Based on the energy equilibrium theory of fluvial geomorphologists, it was hypothesized that the structural and functional characteristics of stream communities are adapted to conform to the most probable position or mean state of the physical system. The authors reasoned that producer and consumer communities characteristic of a given river reach become established in harmony with the dynamic physical conditions of the channel. In natural stream systems, biological communities can be characterized as forming a temporal continuum of synchronized species replacements. This continuous replacement functions to distribute the utilization of energy inputs over time. Thus, the biological system moves towards a balance between a tendency for efficient use of energy inputs through resource partitioning (food, substrate, etc.) and an opposing tendency for a uniform rate of energy processing throughout the year. It was theorized that biological communities developed in natural streams assume processing strategies involving minimum energy loss. Downstream communities are fashioned to capitalize on upstream processing inefficiencies. Both the upstream inefficiency (leakage) and the downstream adjustments seem predictable. The authors proposed that this River Continuum Concept provides a framework for integrating predictable and observable biological features of lotic systems. Implications of the concept in the areas of structure, function, and stability of riverine ecosystems were discussed. (Sims-ISWS)

LEAF LITTER PROCESSING IN A REGULATED ROCKY MOUNTAIN STREAM,
Colorado State Univ., Fort Collins.
R. A. Short, and J. V. Ward.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, No 1, p 123-127, January 1980. 1 Fig, 2 Tab, 14 Ref.

Descriptors: *Leaves, *Streams, *River regulation, *Rocky Mountain Region, *Colorado River, Mountains, Rivers, Litter, Invertebrates, Temperature, Water temperature, Dams, Streamflow, Biology, *Leaf litter processing.

Processing of alder (Alnus tenuifolia) was investigated during autumn and winter to determine the influence of stream regulation on leaf litter processing. Study sites were the Colorado River below Granby Dam and the Fraser River, an unregulated tributary. Alder leaves (5-g units) were attached to bricks and placed in riffles. Leaching controls were retrieved after 48 h; thereafter five replicates were collected from each site after 17, 38, 52, and 66 d. There were significant differences (P less than 0.05) in processing rates between sites. The loss rate coefficient (k) was much higher ($k = 0.0462$) for leaves incubated in the regulated section of the Colorado River than for those in the unregulated tributary ($k = 0.0235$). The hypothesis that reductions in macroinvertebrate shredders would decrease processing rates of leaf litter in regulated streams was not supported by the results. The 'winter warm' thermal regime below the reservoir seemed to compensate for the virtual absence of shredder species apparently by enhanced microbial processing. (Sims-ISWS)

CHARACTERIZATION AND MODELS OF WATERSHED STORAGE,
Purdue Univ., Lafayette, IN. School of Civil Engineering.
A. R. Rao, P. C. Tao, and C. Rukvichai.
Journal of Hydrology, Vol 45, No 3/4, p 253-277, February 1980. 15 Fig, 6 Tab, 18 Ref. DACW 27-74-C-0072.

Descriptors: *Watershed(Basins), *Rainfall-runoff relationships, *Kentucky, Soil moisture, Hydrology, Time series analysis, Statistical models, Temperature, Streamflow, Evapotranspiration, Precipitation(Atmospheric), Fourier analysis, *Watershed storage, Stochastic models.

Precipitation and runoff are usually the only variables considered in forecasting runoff from watersheds by stochastic models. However, the degree of saturation of watersheds strongly affects statistical characteristics of daily runoff. Watershed storage series, which indicate the degree of saturation of a watershed, were analyzed, and the results were presented. The data from four watersheds in the Green River basin in Kentucky were analyzed. After a discussion of characteristics of the basic data, the watershed storage series was computed and its spectrum, correlogram, and other characteristics were discussed. Stochastic models were developed for the watershed storage series, and their prediction capability was analyzed. Daily watershed storage is a highly correlated seasonal variable which can be forecast a few days ahead with great accuracy. The utility of the watershed storage series in forecasting runoff was briefly discussed. (Lee-ISWS)

More than 80% of the total 1500 mm/year rainfall in the Indian Central Himalayas occurs during the monsoon months of June to September, when high intensity rains and cloudbursts are common. There is excessive runoff due to diminishing forest cover, unguarded terrace fields, steep and barren slopes, and periodic seismic phenomena, causing serious erosion, loss of top soil, leaching of the meagre soil nutrients, and high floods. The runoff carries a heavy silt load that causes rapid siltation of dams, reservoirs, rivers, and lakes. Construction of new roads extending across the hills has also caused extensive deforestation and landslides which have greatly increased the already severe problems of siltation and floods. In addition, the lakes of the Central Himalayas are becoming eutrophic and highly polluted due to increased human settlement and poor sanitation. The recent high floods in the Gangotri-Bhagirathi-Alakhnanda-Ganga basin and in the Jamunetri-Jamuna basin, have been caused partially by excessive rainfall in August 1978, but mainly by the siltation of streams and rivers during the last century. Some immediate preventive and remedial measures against destructive floods in the Central Himalayas are presented. (Sims-ISWS)

APPLICATION OF RECENT RESULTS IN FUNCTIONAL ANALYSIS TO THE PROBLEM OF WATER TABLES,
Cold Regions Research and Engineering Lab., Hanover, NH.
Y. Nakano.
Advances in Water Resources, Vol 2, No 4, p 185-190, December 1979. 7 Ref.

Descriptors: *Darcys law, *Water table, *Hydrodynamics, *Potential flow, *Theoretical analysis, Mathematics, Analysis, Continuity equation, Groundwater, Porous media, Interfaces, Singularities, Singular surfaces.

The traditional viewpoint in hydrology and soil physics purports that water tables appearing in porous media described by Darcy's law and the extended Darcy's law are not singular surfaces. Several particular solutions in which singularities occur were presented as counter-examples to the traditional viewpoint and as evidence supporting the new theory that water tables are generally singular surfaces. THREE-DIMENSIONAL SEEPAGE THROUGH A HOMOGENEOUS DAM,
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
J. Caffrey, and J. C. Bruch, Jr.
Advances in Water Resources, Vol 2, No 4, p 167-176, December 1979. 7 Fig, 11 Ref.

Descriptors: *Numerical analysis, *Finite element analysis, *Free surfaces, Porous media, Dams, Analysis, Water table, Seepage, Potential flow, *Three-dimensional flow, *Finite difference analysis, Stream functions.

Seepage flow through a homogeneous earth dam is a free surface flow phenomenon. Because of the shape of the dam, a two-dimensional analysis may not be appropriate and a three-dimensional analysis would be required. Such situations were investigated using the Baiocchi method and transformation. Algorithms using finite difference and finite element successive over-relaxation methods with projection were formulated. The solution to several example cases were presented with a discussion of the approach. (Adams-ISWS)

KARSTIC SPRING RECESSION HYDROGRAPH AND WATER TEMPERATURE ANALYSIS: OYMAPINAR DAM PROJECT, TURKEY,
J. Karanjac, and A. Altug.
Journal of Hydrology, Vol 45, No 3/4, p 203-217, February 1980. 6 Fig, 6 Ref.

Descriptors: *Karst, *Springs, *Sinks, *Dams, *Leakage, Tracers, Fluorescent dye, Velocity, Groundwater movement, Transmissivity, Water temperature, Groundwater recharge, Recession curves, Hydrographs, Water circulation, Limestones, Base flow, Karst hydrology, Discharge(Water), Depth, Geologic control, *Turkey, Hydraulic regime.

Karstic springs downstream of the high Oymapinar Dam, Turkey, which is under construction, were a cause of concern for eventual leakage of the Oymapinar Reservoir. Springwater temperatures were evaluated to indicate the depth of circulation and, implicitly, the extent of karstification. The evaluation of the temperature record, coupled to the interpretation of the spring recession hydrograph, was used to formulate the hypotheses for the recharge areas of the springs, transmissivity of the system, size of the system, and hydraulic regime of the springs. DISPERSIVITY AND VELOCITY RELATIONSHIP FROM LABORATORY AND FIELD EXPERIMENTS,
Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg bei Munich (Germany, F.R.). Inst. fuer Radiohydrometrie.
D. Klotz, K-P. Seiler, H. Moser, and F. Neumaier.
Journal of Hydrology, Vol 45, No 3/4, p 169-184, February 1980. 10 Fig, 3 Tab, 16 Ref.

Descriptors: *Dispersion, *Velocity, *Laboratory tests, *On-site tests, Porous media, Hydraulics, Sediments, Sands, Gravels, Groundwater, Observation wells, *Dispersivity, Longitudinal dispersion, Grain-size distribution.

Laboratory test results on longitudinal dispersion of soluble material in loose rocks with artificially composed or natural grain-size distributions were compared with one another and with results of field tests. In this way it can be demonstrated that it is quite possible to translate laboratory results to field conditions, if sedimentological properties of the loose materials are comparable, if bedding (geological interfaces) runs parallel to the flow direction and is hydraulically ineffective, and if distances between injection and detection are about less than 50 m. Transverse dispersion is difficult to determine. At first approximation the width of tracer cloud from a line injection was determined and the aperture angle of the resultant cloud calculated. The laboratory and field experiments showed an aperture angle of about 5 degrees on distances between 10 and 2500 m. (Lee-ISWS)

ESTIMATION OF RECHARGE TO THE PHREATIC AQUIFERS OF THE LOWER MANER BASIN, INDIA, BY USING THE TRITIUM INJECTION METHOD,
National Geophysical Research Inst. Hyderabad (India).
R. N. Athavale, C. S. Murti, and R. Chand.
Journal of Hydrology, Vol 45, No 3/4, p 185-202, February 1980. 6 Fig, 6 Tab, 10 Ref.

Descriptors: *Groundwater recharge, *Water table aquifers, *Tracers, *Tritium, Aquifers, Groundwater, Monsoons, Sampling, Moisture content, Depth, Soil profiles, *India.

Recharge to the phreatic aquifers in seven different geological formations of Lower Maner Basin, Andhra Pradesh, which forms a part of the Godavari Rift Valley, has been measured by using the tritium tagging method. Twenty-eight sites, covering an area of approximately 1575 sq km, were selected on the basis of geology, topography, drainage pattern, and soil types of the basin. Tritium injections, at 70 cm depth, were made before the commencement of the monsoon rains in June 1976. Soil core samples, in 10-cm sections, were collected from the injection sites in December 1976, i.e., after completion of the monsoon rains. Variation in tritium activity and moisture content with depth, in each soil profile, was measured for estimation of tracer movement and calculation of recharge. The recharge values over Kota claystones and Pakhal shales were found to range from 7 to 12 cm, with an average value of 9.6 cm. In Kamthi sandstones, which also contain some shaly facies, the recharge was found to vary from 7 to 24 cm, with a mean value of 12.7 cm. The total annual input to groundwater reserves of the phreatic aquifers of the basin was estimated as 152,000,000 + or - 15,000,000 cu m. This amounts to approximately 8% of the average annual rainfall of 125 cm over the basin. (Visocky-ISWS)

AGRICULTURAL LAND USE AND ITS EFFECT ON CATCHMENT OUTPUT OF SALT AND WATER--EVIDENCE FROM SOUTHERN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Land Resources Management.
D. R. Williamson, and E. Bettenay.
Progress in Water Technology, Vol 11, No 6, p 463-480, 1979. 7 Fig, 4 Tab, 39 Ref.

Descriptors: *Land clearing, *Groundwater, *Recharge, *Salinity, *Australia, Salts, Runoff, Streamflow, Seepage, Water quality, Vegetation effects, Watersheds(Basins), Climates, Soils, Rainfall, Infiltration, Agriculture, Land use, Salt balance, Clearing effects.

Agricultural development over the past 200 years in southern Australia has involved extensive clearing of the native, evergreen vegetation and its replacement with annual rain-fed crops and pastures. These introduced plants have a limited growing season, are comparatively shallow rooted, and hence, in a Mediterranean climate, use less water. A consequence of this is the secondary salinization of about 277,000 ha of previously productive land and associated degradation of valuable water resources. These effects were first noted in the 1890s, and by 1924 it was hypothesized that increased recharge caused a rise in levels of saline underground water bringing salts to the soil surface particularly near water courses. Studies initiated in the 1960s have shown that large quantities of soluble salts are stored in the deep weathering zones characteristic of southern Australia. Under forested conditions, surface and near surface waters are relatively fresh, although deeper groundwaters may be highly saline. Data presented showed that groundwaters rise as a consequence of clearing. This leads to the development of saline seeps, which, together with an increase in saline baseflow, results in increased salt export from catchments. Although there is usually a concomitant increase in runoff, this may not be sufficient to keep annual stream salinity below an acceptable level. The pattern of changes in streamflow quality during the year was shown to provide an indicator of the contribution of saline baseflow to streams from small catchments. This may be useful in predicting the effect of clearing, or in indicating a decline in saline baseflow following re-afforestation. (Sims-ISWS)

Descriptors: *Alaska, *Groundwater recharge, *Frozen soils, *Permafrost, Frozen ground, Pumping, Model studies, Mathematical studies, Snowmelt, Precipitation(Atmospheric), Groundwater barriers, Groundwater movement, Tundra, Thawing.

The role of frozen soils in northern groundwater systems is examined and modeled. The combination of relatively dry climates, frozen soils, and increased use of groundwater is creating new stresses on the groundwater systems of northern areas such as Alaska where declining water levels are reported. To study the regional effects of pumping, a model was developed that uses the transient equation for liquid water transport in the soil. This water transport is created by hydraulic gradients in the soil. Two cases were simulated with the model, a single layered organic only case and a double layered organic and mineral case. Results of the model give an indication of the potential for recharge in a region. Factors accounted for in the model include: distribution of soil water, soil conditions, slope, and input rate. Results of the model application show that in the interior of Alaska the potential for groundwater recharge from precipitation is limited. This is due to both the pattern of precipitation and soil conditions. Prolonged rainfall or snowmelt is needed for significant recharge. Model results from a snowmelt show that frozen soil with a low moisture content of about 10% behaves much like dry unsaturated soil while very wet frozen soils are considered impermeable. Model equations and other results are given. (Seigler-IPA)

GROUNDWATER UTILIZATION, SOUTH FORK OF LONG ISLAND,
G. F. Pinder, and R. H. Page.
Clearwaters, Vol 9, No 4, p 11-14, December 1979. 7 Fig, 7 Ref.

Descriptors: *Mathematical models, *Aquifer characteristics, *Groundwater resources, Seepage, Groundwater movement, Water level fluctuations, Pumping, Infiltration, Saline water, Saline water-freshwater interfaces, Water levels, Water wells, Water supply development.

Two mathematical models developed to predict groundwater system responses to pumpage and development on the South Fork of Long Island are briefly described. The aquifer has a pillow of fresh water underlain by denser saline water. Fresh water flows outward toward the sea by coastal seepage and is replaced by natural recharge from precipitation and groundwater streams. Any changes in this balance of inflow and outflow such as a drought or pumpage results in a lower equilibrium thickness and could result in salt water being drawn up into wells depending on their location and depth. The models developed to study various pumpage situations use nonlinear partial differential equations solved numerically with finite elements. The regional model simulates variability in the two horizontal space dimensions, while the other model, the local model, studies pressures and concentrations near a well. The local model, which is used to predict the salinity of water from a particular well, is based on equations describing the density-dependent groundwater flow and the convective and dispersive transport of a solute. System inputs and parameters for the regional model, the hydrogeologic properties of the aquifer and inflow-outflow rates, were gathered in 1975-1976 and the model was calibrated to allow for errors in data. Data from a drought period in the 1960's were used for forecasting the impact of proposed withdrawals. Most of the pumpage options simulated were found to have acceptable regional impact. HYDROLOGIC DATA FOR THE MORRIS BRIDGE WELL-FIELD AREA, HILLSBOROUGH COUNTY, FLORIDA, 1971-78,
Geological Survey, Tallahassee, FL. Water Resources Div.
A. D. Duerr.
Available from: OFSS Bx 25425 Fed. Ctr. Denver, CO, paper copy $10.25 microfiche $3.50. Geological Survey open-file report 79-1262, 1979. 76 p, 9 Fig, 5 Tab, 8 Ref.

Descriptors: Hydrologic data, *Well data, *Florida, *Groundwater, *Data collections, Test wells, Aquifer characteristics, Monitoring, Networks, Streams, Hydrographs, Water levels, Streamflow, Rainfall observation wells, Water yield, Drawdown, *Hillsborough County(Fla).

Well data are summarized for 102 wells constructed in the Morris Bridge well-field area in north-central Hillsborough County. Of the wells reported, 20 are public-supply wells that have yields averaging 1,800 gallons per minute and specific capacities that range from 36 to 346 gallons per minute per foot of drawdown. Also presented are 28 drillers' logs, 7 lithologic logs, and an index of 64 geophysical logs of 18 wells in the well-field area. The report also includes hydrographs of water levels of 10 observation wells, hydrographs of stream stage and streamflow of the Hillsborough River, and hydrographs of rainfall for two stations. JANUARY 1979 WATER LEVELS, AND DATA RELATED TO WATER-LEVEL CHANGES, WESTERN AND SOUTH-CENTRAL KANSAS,
Geological Survey, Lawrence, KS. Water Resources Div.
M. E. Pabst.
Geological Survey open-file report 79-925, May 1979. 213 p, 3 Tab.

Descriptors: *Groundwater, *Water levels, *Observation wells, *Kansas, *Water level fluctuations, Irrigation, Seasonal, Groundwater recharge, Aquifers, Hydrogeology, Western Kansas, South-central Kansas.

Water-level measurements were made in about 1,300 observation wells in 35 counties as part of an annual inventory of ground-water conditions in western and south-central Kansas. The measurements were made in mid-winter, mostly in January 1979, when pumping was minimal and water levels had recovered from the effects of pumping during the previous irrigation season. Tables in this report show the depths to water in 1940, 1944, or 1950 (the predevelopment years), 1966 (a year of abnormally high rainfall), 1978 and 1979; water-level declines from 1940-79, or 1950-79, from 1966-79, 1974-79, or 1978-79; and average annual declines from 1940-79, 1944-79, or 1950-79 and from 1966-79. Also shown are saturated thicknesses of the deposits in 1940, 1944, or 1950 and in 1979, as well as the percentage change in saturated thickness from 1940-79, 1944-79, or 1950-79. (Kosco-USGS)

HYDROLOGIC AND GEOLOGIC DATA FROM THE UPPER EAST COAST PLANNING AREA, SOUTHEAST FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
W. L. Miller.
Available from: OFSS Bx 25425, Fed. Ctr. Denver, CO 80225, Paper copy $13.25, Microfiche $3.50. Geological Survey open-file report 79-1543, 1979. 99 p, 2 Fig, 6 Tab.

Descriptors: *Hydrologic data, *Hydrogeology, *Water resources, *Planning, *Florida, Investigations, Well data, Aquifers, Lithologic logs, Water levels, Groundwater, Water quality, Water resources development, *Southeast Florida.

The Upper East Coast Planning Area, one of five designated planning areas in the South Florida Water Management District, consists of St. Lucie, Martin, and eastern Okeechobee Counties. Existing hydrologic and geologic data have been compiled as a base for additional investigations to determine the water-bearing characteristics of the shallow aquifer system in the area. These data include lithologic logs from 51 wells in excess of 90 feet in depth, periodic ground-water levels from 100 wells, and ground-water levels from 100 wells, and ground-water quality data from 93 wells. (Kosco-USGS)

HYDROGEOLOGIC FEATURES OF THE ALLUVIAL DEPOSITS IN THE NOWOOD RIVER DRAINAGE AREA, BIGHORN BASIN, WYOMING,
Geological Survey, Cheyenne, WY. Water Resources Div.
M. E. Cooley, and W. J. Head.
Geological Survey open-file report 79-1291 (WRI), 1979. 55 p, 4 Fig, 2 Plates, 11 Tab, 9 Ref.

Descriptors: *Groundwater resources, *Wyoming, *Aquifer characteristics, *Water yield, *Alluvium, Water wells, Alluvial aquifers, Hydrogeology, Surface-groundwater relationships, Rocky Mountain region, Streamflow, Groundwater recharge, Flood plains, Irrigation, Chemical analysis, Maps, *Bighorn Basin(Wyo), *Norwood River drainage area(Wyo).

In the Nowood River drainage area, Wyoming, the principal deposits comprising the alluvial aquifer include the flood-plain and younger (generally undissected) alluvial-fan deposits and a unique boulder-fan gravel. Other deposits mapped, but virtually nonwater yielding, are the older (dissected) alluvial-fan, pediment, and terrace deposits. Terraces are capped by gravel and form levels at 30-40, 45-100, 120-150, 200-260, and 280-330 feet above the Nowood River. The thickness of the alluvial aquifer indicated from the sparse well-log data and 42 surface resistivity measurements is between 25 and 50 feet along the Nowood River and more than 60 feet along Tensleep and Paint Rock

Creeks. The resistivity measurements indicate a buried bedrock ridge below the boulder-fan gravel between Paint Rock and Medicine Lodge Creeks and a buried channel filled by alluvium along Tensleep Creek. Well yields from the alluvial aquifer are estimated to be low. The most favorable areas for ground-water development are from the flood-plain alluvium along Tensleep Creek and from the boulder-fan gravel and adjoining flood-plain alluvium along Paint Rock and Medicine Creeks. Along the Nowood River the flood-plain alluvium, although its yields are small, has the best potential for ground-water development. (Kosco-USGS)

EFFECTIVE RAINFALL ESTIMATION,
Technical Univ. of Prague (Czechoslovakia). Dept. of Irrigation and Drainage.
J. Mls.
Journal of Hydrology, Vol 45, No 3/4, p 305-311, February 1980. 3 Fig, 5 Ref.

Descriptors: *Precipitation excess, *Effective precipitation, *Runoff, Rainfall, Runoff coefficient, Runoff forecasting, Infiltration rates, Infiltration, Surface runoff, Hydrology, Soil moisture, Ponding, *Asymptotic infiltration rate, Water ponding, Time of ponding.

A method for estimating the rainfall effective in generating runoff was presented which is based on the infiltration process. With the use of the known equations that describe the ponding infiltration rate in time, a functional relationship between the cumulative infiltration and the maximum possible infiltration rate was stated. Based on that statement the equation of infiltration rate such as it occurs during a general rainfall, was derived, and the infiltration envelope curve was defined. The theory was applied to the evaluation of infiltration from rain of constant intensity, and the results were compared with the numerical analysis of Smith, offering a good agreement. The method was further used to determine the effective rainfall for a given rain of nonconstant intensity. (See also W73-04376) (Lee-ISWS)

CONSTANT-RAINFALL INFILTRATION,
Technical Univ. of Prague (Czechoslovakia). Soil Science Lab.
M. Kutilek.
Journal of Hydrology, Vol 45, No 3/4, p 289-303, February 1980. 7 Fig, 2 Tab, 23 Ref.

Descriptors: *Infiltration, *Runoff, *Infiltration rates, Runoff coefficient, Soil moisture, Ponding, Moisture content, Hydrology, Rainfall, *Ponding time, Moisture profile, Infiltration equation.

An approximate solution of the infiltration equation for rain of constant intensity was developed. From the theory, the ponding time and the development of the moisture profile at time shorter than ponding time were determined. Using the theoretical background, simple empirical and algebraic equations were derived for the calculation of the ponding time. The solutions were compared with the results of the numerical analysis; good agreement was found. The solution of the infiltration for time greater than ponding time was obtained either for 'delta function' soil or for an empirical infiltration equation. (Lee-ISWS)

ESTIMATION OF SOIL MOISTURE AT DEEPER DEPTH FROM SURFACE LAYER DATA,
Meteorological Office, Poona (India).
B. C. Biswas, and S. K. Dasgupta.
Mausam, Vol 30, No 4, p 511-516, October 1979. 7 Fig, 2 Tab, 6 Ref.

Descriptors: *Soil moisture, *Estimating, *Model studies, Mathematical models, Estimating equations, Soil water, On-site investigations, Soils, Soil types, Rainfall, Infiltration, Soil water movement, Agriculture, Regression analysis, Soil science, *India.

In situ measurements of soil moisture at deeper layers is very difficult especially in heavy soils. Regression equations have, therefore, been developed to estimate in the clear season soil moisture variations at deeper layers from fluctuation of soil moisture in the surface layer. Estimated values were compared with observed values. The estimates were reasonably accurate. (Sims-ISWS)

Descriptors: *Soil water, *Soil moisture, *Evapotranspiration, Soils, Soil types, Crops, Rainfall, Water storage, Drainage, Evaporation, Agriculture, Meteorology, Climatology, Soil science, *India, Water availability.

The soil moisture available in the red sandy soils, red loams, medium black soils, and deep black soils at Bijapur was estimated using a simple climatic water balance model. As the ratio of actual evapotranspiration to the potential evapotranspiration gives the rate at which water is supplied compared to the demand for water, the values of the ratio A sub E/P sub E with 40, 60, and 80% probabilities in different soils were presented. The planting schedules for short, medium, and long duration crops were worked out, and the chances of sowing the crops of different durations during the optimum sowing periods were given. (Sims-ISWS)

WATER MANAGEMENT, WATER QUALITY AND ENGINEERING GEOLOGY STUDY OF SELECTED OXBOW LAKES AS THEY MAY BE IMPACTED BY DREDGING -- PHASE II,
Iowa State Univ., Ames. Dept. of Civil Engineering.
R. A. Lohnes, R. W. Bachmann, and T. A. Austin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-164692, Price codes: A06 in paper copy, A01 in microfiche. Iowa State Water Resources Research Institute, Iowa State University Completion Report No ISWRRI-103, ISU-ERI-AMES-80085, October 1979. 106 p, 21 Fig, 16 Tab, 45 Ref. OWRT A-066-IA (1).

Descriptors: *Iowa, *Oxbow lakes, *Dredging, *Sedimentation, Lake morphology, Lake morphometry, Lake sediments, Geomorphology, Water quality, Perched water, Groundwater, Hydrogeology, Erosion, Hydrology, Pumping, Wells.

Seven oxbow lakes located on the Missouri River floodplain in Iowa were studied to determine their value and water quality characteristics and to evaluate alternate water management improvement programs. The lakes studied were Lake Quinnebaugh, a shallow marsh; Badger Lake with extensive areas of aquatic vegetation; DeSoto Bend, a man-made cutoff; Carter Lake; Lake Manawa; Brown's Lake; and Blue Lake. Brown's Lake, Blue Lake, Lake Manawa, and DeSoto Bend are used extensively for recreation and were intensively studied. Data were gathered on lake morphometry, history, sedimentation, hydrology, and water quality. Results show that since these lakes were first cut off in the 1800's they have decreased to about 40% of their original area. This decrease is mostly due to lower groundwater tables rather than the common belief that extensive sedimentation has occurred. The lakes are perched and low-permeability silt and clay sediments seal the bottom to retard outward flow although there is a general outward flow gradient for most of the lakes. If dredging is used as a management technique care must be taken to prevent the destruction of this seal. Supplemental pumpings of groundwater appear to be a feasible management technique but well location should be carefully selected. Specific recommendations are given for the various lakes. (Seigler-IPA)

EFFECT OF AGRICULTURE ON CEDAR LAKE WATER QUALITY,
Illinois State Water Survey, Urbana.
D. P. Roseboom, R. L. Evans, and T. E. Hill.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-164619, Price codes: A04 in paper copy, A01 in microfiche. ISWS Circular 138, 1979. 61 p, 42 Fig, 32 Tab, 79 Ref.

Descriptors: *Lakes, *Illinois, *Water quality, *Agricultural watersheds, *Water pollution sources, Aquatic environment, On-site investigations, Data collections, Limnology, Water pollution, Effects, Pesticides, Organic pesticides, DDT, Dieldrin, Lake sediments, Heavy metals, Water chemistry, Dissolved oxygen, Analysis, Algae, Benthos, Water temperature, Lead, Copper, Zinc, Iron, Mercury, Arsenic, Secchi disks, Alkalinity, Hardness(Water), Phosphorus, *Carbondale(IL), *Cedar Lake(IL).

This study was made to delineate the type, distribution, and magnitude of orchard-related pesticides in the aquatic environment of Cedar Lake which includes the older impoundments of Little Cedar Lake and the Alto Pass Reservoir. Cedar Lake is a source of water supply for Carbondale, Illinois. The study included analyses for mineral and pesticide content of the soils, the water and bottom muds of the three lakes, and the water and sediments of the four major tributaries. In addition, the general limnology and biological characteris-

tics of Cedar Lake were defined, sedimentation surveys of the two older lakes were performed, and relevant data regarding pesticide content in fish were evaluated. The results showed that application of pesticides in well-sodded orchards does not pose a serious threat to the water quality of Cedar Lake, but a threat does exist when such orchard lands are converted to row crops, subdivisions, or other uses that destroy the sod cover that minimizes soil erosion. Pesticide residues that make their way by soil movement to the aquatic environment do accumulate in the bottom muds of the lakes, and may become solubilized and thus transferred to the lake waters. The waters of Cedar Lake stratify in summer resulting in depletion of dissolved oxygen in the lower 15 feet of water. Lake management to minimize such oxygen depletion is needed to control taste and odors and the introduction of undesirable metals in the water supply. The sedimentation surveys showed that soil loss on the watershed is excessive and that soil erosion prevention procedures are needed. The desirable game fish in the lakes contain mercury concentrations in excess of FDA tolerance limits despite the fact that mercury in excess of background levels was not found in the soils, suspended sediment, nor lake bottom sediments in the watershed. Research as to possible effects of inundated vegetation on the transfer of mercury from water to fish is suggested. DDT and dieldrin in fish are not a cause for concern in the Cedar Lake watershed. (Humphreys-ISWS)

COUPLING OF INTERNAL WAVE MOTION WITH ENTRAINMENT AT THE DENSITY INTERFACE OF A TWO-LAYER LAKE,
Canterbury Univ., Christchurch (New Zealand). Dept. of Civil Engineering.
R. H. Spigel.
Journal of Physical Oceanography, Vol 10, No 1, p 144-155, January 1980. 3 Fig, 17 Ref.

Descriptors: *Lakes, *Waves(Water), *Internal waves, *Model studies, Mathematical models, Density, Winds, Stratification, Equations, Energy, Pressure, Stress, Velocity, Entrainment, Limnology.

A solution was presented to the problem of a two-layer rectangular basin subject to a suddenly applied, uniform wind stress; Coriolis effects were ignored. The solution was obtained for the case in which the time scales of internal wave motion, wave decay, and entrainment are widely separated; in this range the entrainment across the interface is a perturbation on the mean motions. The solution included an oscillatory initial response, followed by wave decay and a steady-state interface setup with baroclinic circulation, all superimposed on a slow deepening of the top layer by entrainment. The entrainment in turn affects the frequency of interfacial waves as the mixed layer deepens--the deepening alters top and bottom layer thickness and the density jump between them. For the range of mixed-layer Richardson number considered, entrainment is energized by wind stirring at the water surface, which does work at a rate proportional to (u*) cubed. (Sims-ISWS)

A SIMPLE REFLECTANCE METHOD FOR THE MEASUREMENT OF PARTICULATE PIGMENT IN LAKE WATER AND ITS APPLICATION TO PHOSPHORUS-CHLOROPHYLL-SESTON RELATIONSHIPS,
McGill Univ., Montreal (Quebec). Dept. of Biology.
M. Bergmann, and R. H. Peters.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, No 1, p 111-114, January 1980. 3 Fig, 10 Ref.

Descriptors: *Phosphorus, *Chlorophyll, *Seston, *Lakes, Sampling, Analytical techniques, Pigments, Plant pigments, Light, Reflectance, Algae, Aquatic microorganisms, Filters, Membranes, Limnology.

This paper described a new method to measure total sestonic pigment based on the reduction in the amount of light reflected from a membrane filter after a given volume of lake water has passed through the filter. For a sample of 30 lakes, this index of 'reflectance' gave a better regression on total phosphorus than did chlorophyll which suggests that part of the variation in published phosphorus-chlorophyll relationships results from the association of phosphorus with pigments other than chlorophyll. But the residual variation suggested both that the amount of pigment developed per unit of phosphorus varies among lakes and that the index does not completely represent the seston. Relationships between reflectance and concentration of chlorophyll, phosphorus, and seston were good enough to suggest that this rapid, easy analysis may find application as an adjunct to more traditional analyses wherever membrane filters are routinely used in the analysis of lake water. (Sims-ISWS)

OXYGEN DEPLETION IN LAKE ERIE: HAS THERE BEEN ANY CHANGE,
Department of the Environment, Burlington (Ontario); and National Water Research Inst., Burlington (Ontario).
M. N. Charlton.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 37, No 1, p 72-81, January 1980. 8 Fig, 1 Tab, 23 Ref.

Descriptors: *Oxygen, *Dissolved oxygen, *Hypolimnion, *Lake Erie, Temperature, Water temperature, Water levels, Climatology, Sampling, Data processing, Analytical techniques, Lakes, Eutrophication, Limnology, *Oxygen depletion rates.

A new analysis of hypolimnetic oxygen in central Lake Erie indicates that historic increases in the apparent depletion were not as great as formerly believed. The differences that did occur were mostly related to variations in hypolimnion thickness. Changes, if any, in the oxygen depletion rate due to eutrophication are as yet too small to be recognized. Present-day oxygen depletion rates, when corrected for the relatively high temperatures in Lake Erie, are within the range thought to be indicative of mesotrophy in small lakes. The general level of oxygen depletion observed in the central basin of Lake Erie is expected on the basis of morphology alone. (Sims-ISWS)

DYNAMICS OF DISSOLVED OXYGEN DURING ALGAL BLOOM IN LAKE KASUMIGAURA, JAPAN,
Tsukuba Univ., Ikaraki (Japan). Inst. of Biological Sciences.
H. Seki, M. Takahashi, Y. Hara, and S. Ichimura.
Water Research, Vol 14, No 2, p 179-183, 1980. 4 Fig, 4 Tab, 14 Ref.

Descriptors: *Dissolved oxygen, *Algae, *Lakes, Nutrients, Solar radiation, Water temperature, Light, Phytoplankton, Chlorophyll, Bacteria, Nitrogen, Nitrogen compounds, Phosphorus, Oxygen, Water quality, Sampling, Limnology, Analytical techniques, Data processing. *Lake Kasumigaura(Japan).

Dynamics of dissolved oxygen during an algal bloom were studied in Lake Kasumigaura. Great amounts of oxygen arose from photosynthesis, and the concentration of dissolved oxygen reached 190% of saturation at 12 h. The majority of the dissolved oxygen produced was liberated into the atmosphere or consumed by microorganisms. Only minor fractions were transported into the dysphotic zone due to the low eddy diffusion coefficient in deeper waters of the euphotic zone. (Sims-ISWS)

DESCRIPTIVE AND COMPARATIVE STUDIES OF MAINE LAKES,
Maine Univ. at Orono. Life Sciences and Agriculture Experiment Station.
R. B. Davis, J. H. Bailey, M. Scott, G. Hunt, and S. A. Norton.
University of Maine Life Sciences and Agriculture Experiment Station. Technical Bulletin No 88, March 1978. 337 p, 68 Fig, 33 Tab, 117 Ref, 5 Append.

Descriptors: *Lakes, *Maine, *Basic data collections, *Chemical properties, *Biological properties, Water chemistry, Water pollution sources, Trophic level, Oligotrophy, Phosphorus, Nitrogen, Phytoplankton, Zooplankton, Water pollution, Watersheds(Basins), Land use, Alkalinity, Chlorophyll, Coliforms.

Maine has 5,700 lakes greater than 0.4 ha in area; this descriptive and comparative study focused on 17 Maine lakes (22 basins). Lakes were sampled June 1970-May 1973. Watersheds are usually heavily forested (50-97%), but in southwestern Maine agricultural lands comprise significant percentages of the watersheds. Major point pollution sources exist at Haley Pond and Long Lake; otherwise, pollutants originate at shoreline cottages or from agricultural fields. Severe cultural eutrophication exists only in a few Maine lakes. Mean alkalinities range 4-27 ppm CaCO3, typical of oligotrophic-oligomesotrophic lakes. Mean total phosphorus ranges 2.4-27.8 ppb; phosphate concentrations range 0.2-4.0 ppb in surface waters. Mean inorganic fixed nitrogen ranges 32-190 ppb and averages 96 ppb. Mean phytoplankton cell counts range 140-30,700/ml; blue-green algae are most numerous and diatoms most voluminous. Mean sestonic chlorophyll-a values range 0.8-4.3 microg/l. The most numerous zooplankters are rotifers, especially Conochilus, Keratella and Kellicottia; mean values range 10-179 zooplankters/l. Mean Secchi disc transparency ranges 2.6-9.4 m. Maine lakes have an average of 11.9 cottages per km of shoreline. Lake water contamination by coliform bacteria occurs at numerous locations associated with cottages. Suitability of shoreline soils for septic disposal is poor or very poor at most locations. Open water mean counts are 4-7 FC/100 ml, unsuitable for drinking water purposes. (Danovich-Wisconsin)

ROLE OF SEDIMENTATION IN THE PHOSPHORUS BUDGET OF NATURAL AND ARTIFICIAL IOWA LAKES,
Iowa State Univ., Ames. Dept. of Animal Ecology.
R. W. Bachmann, and D. E. Canfield.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-166507, Price codes: A05 in paper copy, A01 in microfiche. Iowa State Water Resources Research Institute, Iowa State University Completion Report No ISU-ERI-AMES-80030, September 1979. 101 p, 7 Fig, 11 Tab, 56 Ref. OWRT A-063-IA(1).

Descriptors: *Iowa, *Sedimentation rates, *Phosphorus, *Cycling nutrients, Lake stages, Mathematical models, Eutrophication, Limnology, Nutrients, Trophic level, Bottom sediments, Lake sediments, Chlorophyll, Secchi disks.

The limnological factors that influence sedimentation rates in natural and artificial lakes were studied and an empirical phosphorus model to predict

lake total phosphorus concentrations was developed and tested. Sediment traps were used to measure phosphorus sedimentation rates in four natural and four artificial Iowa lakes. While the sedimentation rates were found to be highly variable they were found to directly and significantly correlate with mean inorganic suspended matter concentrations and inorganic sedimentation rates. The rates measured in the Iowa lakes indicated that the lakes were losing from 5% to 60% of their total phosphorus daily. Since these lakes were not rapidly depleted of phosphorus as these rates would indicate it is probable that resuspension and resedimentation caused the traps to overestimate the net accumulation. Nutrient budget data from 290 natural and 433 artificial lakes in the U.S., Canada, and Europe, were used as a data base for a simple empirical phosphorus loading model that is based on the Vollenweider equation for input and output of phosphorus in lakes. The model was tested and found to predict lake total phosphorus concentrations equally well in both natural and artificial lakes. The model produces unbiased estimates of total phosphorus concentrations and has a 95% confidence interval of 31% to 288%. Due to the influence of allochthonous particulates in artificial lakes the model estimates for artificial lakes are less reliable. (Seigler-IPA)

BIOLOGICAL OBSERVATIONS ON THE CRATER LAKES OF JEBEL MARRA, SUDAN,
Westfield Coll., London (England). Dept. of Zoology.
J. Green, A. I. El Moghraby, and O. M. M. Ali.
Journal of Zoology, Vol 189, No 4, p 493-502, December 1979. 6 Fig, 18 Ref.

Descriptors: *Craters, *Lakes, *Jebel Marra(Sudan), *Biological communities, *Salinity, *Oxygen sag, Ecological distribution, Ecotypes, Niches, Eutrophication, Phytoplankton, Zooplankton, Water temperature, Hydrogen ion concentration, Diatoms, Rotifers, Aquatic insects, Volcanoes, Africa, Mixing, Stratification, Winds.

Floral and faunal compositions in two crater lakes on the top of Jebel Marra, western Sudan, were studied in January 1976; differences in fauna observed between these two lakes is attributed to different salinity and oxygen regimes. Small Dariba Lake is shallow (11.5 m) and highly saline with even temperatures throughout the lake. Large Dariba Lake (108 m) is less saline and periodically exhibits temperature stratification. In the shallow lake oxygen is supersaturated in the upper 2 m but no oxygen occurs below 6 m except when strong winds mix the lake, creating 40% oxygen saturation throughout the water column. In the deep lake after strong winds, there is 12% saturation in the top 30 m. In both lakes pH fluctuates between 9.0-10.0. Phytoplankton in Large Dariba Lake consist of Spirulina geitleri and Anabaenopsis arnoldii. Diatoms (Melosira and Nitzchia) are the only phytoplankton present in Small Dariba Lake. Zooplankton Brachionus plicatilis, B. dimidiatus and Hexarthra jenkinae occur in both lakes. Individuals from nine insect orders are found in the smaller lake. A laviform aquatic lampyrid, or glow-worm, is also recorded in the small lake; this is the first account of an aquatic glow-worm in Africa. Poor faunas of these lakes are attributed to: isolation of the volcanic massif in an arid area, lake salinity, and unfavorable oxygen regimes. (Harris-Wisconsin)

MONTHLY AND ANNUAL WATER BUDGETS OF LAKE WINGRA, MADISON, WISCONSIN, 1972-77,
Geological Survey, Madison, WI. Water Resources Div.
R. P. Novitzki, and B. K. Holmstrom.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-149842, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-100, November 1979. 31 p, 6 Fig, 9 Tab, 16 Ref.

Descriptors: *Hydrologic budget, *Lakes, *Wisconsin, *Wetlands, *Lake stages, Water quality, Precipitation(Atmospheric), Inflow, Discharge(Water), Evapotranspiration, Data collections, Lake Wingra(Wis).

This report presents estimated annual and monthly water budgets for Lake Wingra in Wisconsin and the adjacent wetland area for January 1972 through September 1977. Annually, inputs from precipitation, surface runoff, and ground-water inflow are approximately equal (31, 34, and 35 percent, respectively). Outputs include outflow from the lake into Murphy Creek (70 percent), evapotranspiration from the lake and wetland (26 percent) and ground-water outflow (4 percent). The inputs and outputs vary seasonally. In months when snowmelt occurs, surface runoff is a major input (56 percent in March; 46 percent in April). In fall and winter ground-water inflow is a major input (57 percent in November). Precipitation is 41 percent of the inflow in August, but only 18 percent in January. Lake outflow is the major output except in July, August, and September. Combined evaporation and evapotranspiration is a major output in summer (45 to 58 percent) but minor in winter (less than 13 percent). Ground-water outflow is a small part of the budget each month, ranging from 2 percent in March and April to a maximum of 7 percent in September. (Kosco-USGS)

AMMONIUM UPTAKE BY SYMBIOTIC AND APOSYMBIOTIC REEF CORALS,
California Univ., Los Angeles. Dept. of Biology.
L. Muscatine, H. Masuda, and R. Burnap.
Bulletin of Marine Science, Vol 29, No 4, p 572-575, October 1979. 2 Fig, 13 Ref. NSF GB 41458.

Descriptors: *Algae, *Ammonium compounds, *Symbiosis, *Kinetics, *Reefs, Ammonium salts, Madracis mirabilis, Ammonia, Laboratory tests, Nutrients, Ecology, Coral, Nutrient requirements, Discovery Bay, Jamaica, Sea water.

Laboratory experiments of ammonium uptake by symbiotic and aposymbiotic Madracis mirabilis (coral reef) colonies show that uptake is affected by symbiotic algae (zooxanthellae). With symbiotic M. mirabilis, ammonium medium concentration decreases rapidly during the first 10-15 minutes and relatively more slowly thereafter, approaching ambient concentrations after 2-3 hr. Aposymbiotic M. mirabilis and spiked sea water controls also decrease the ammonium concentration, both at virtually identical rates, but at 1/6th the rate of synbiotic M. mirabilis. Faster uptake by isolated algae than by controls; however, uptake rates by isolated algae are also significantly lower than those for intact corals based on zooxanthellae numbers. Naturally-occurring aposymbiotic colonies of M. mirabilis were located in Discovery Bay, Jamaica, contiguous with larger colonies of normal synbiotic M. mirabilis coral. (Danovich-Wisconsin)

Group 2I—Water In Plants

Eurasian milfoil (Myriophyllum spicatum) standing crops range from 0 g/sq m in winter to 60 g/sq m in summer in a cove within Bowline Pond, a small embayment of the Hudson River, New York measured January 1975-1976. M. spicatum main growth occurs May-December; peaks in dry weight biomass are observed in July (60 g/sq m) and October (32 g/sq m). Biomass decreases abruptly in August due to high temperatures (42C). Loss of plant biomass November-January represents winter die-off. Therefore, cove standing stocks exhibit major temporal variability. Low maximum standing crop (60 g/sq m) is due to physical conditions in the estuary; primary factors are probably light penetration (less than 1 m), tidal current regime (velocities up to 30 cm/s), and sediment type (sandy). M. spicatum annual productivity is 82 g/sq m. The proportion of leaf and stem biomass shifts throughout the year. Relative proportion of leaf biomass decreases May-July, corresponding to early M. spicatum growth. Following standing stock peak, the relative proportion of leaf biomass increases. Particulate matter on M. spicatum ranges from 0.8 g/g M. spicatum biomass (June mean) to 3.8 g/g M. spicatum (May mean). Particulate matter dry weight is generally greater than M. spicatum biomass; annual accumulation rate is 118 g/sq m. Large amounts of accumulated particulate matter in May are due to filamentous diatom Melosira. From June to August, Cladophora fracta, a filamentous green algae, comprises most of this material. KINETICS OF RED CLAY BLUFF DISSOLUTION IN WESTERN LAKE SUPERIOR,
Wisconsin Univ.-Superior.
D. A. Bahnick, T. P. Markee, and R. K. Roubal.
Journal of Great Lakes Research, Vol 5, No 2, p 221-224, 1979. 1 Fig, 12 Ref. EPA R005169-01.

Descriptors: *Erosion, *Bank erosion, *Silica, *Lake Superior, Dissolved solids, Clays, Particle size, Mineralogy, Sediments, Solutes, Chemicals, Lakes, Dissolution, Clay bluffs.

The dissolution of red clay bluff samples from the southwestern Lake Superior shoreline area in Lake Superior water or deionized water was studied by following the aqueous concentrations of reactive silica over a 3-month period. The dissolution process was initially rapid, followed by a first-order dissolution process (k = 9.4 x 10 to the minus 7th power/sec) up to about 30 days. After about 30 days, the rate of dissolution of the bluff material followed linear kinetics (k = 5.4 x 10 to the minus 8th power mg Si02/gram of bluff per second). (Sims-ISWS)

Little Traverse Bay, northeastern Lake Michigan, contains sediments ranging in mean grain size from about 1.5 phi around the bay margins to 7 phi in the central portion. Mineralogy of the fine-grained fraction of these sediments show the four main mineral groups, quartz, feldspars, clays, and carbonates, to have decidedly different distributions within the bay. Quartz and feldspar reach maxima near the center of the bay, while carbonates are highest around the edge. Clay mineral abundance reaches three separate maxima in regions characterized by very poorly sorted sediment. There are two important sources of these sediments, extensive outcrops of Devonian limestones and dolomites along the south shore of the bay and bluffs of reddish glacial till along the northwestern shoreline. Materials from these areas are transported eastward to the bay head by longshore transport incurred by the prevailing westerly winds and then return westward along the deep central trough of the bay as the wind-induced setup is relieved. Essentially all the calcite and much of the dolomite entering Little Traverse Bay undergoes dissolution during transport resulting in the carbonate-poor sediments of the bay floor. (Sims-ISWS)

Descriptors: *Erosion, *Sediments, *Sediment transport, *Agricultural-runoff, *Canada, Variability, Spatial distribution, Temporal distribution, Watersheds(Basins), Soils, Suspended solids, Dissolved solids, Precipitation(Atmospheric), Rainfall, Snowmelt, Mapping, Sedimentology.

A detailed study regarding areas that contribute sediment into the streams of two small agricultural watersheds in Canada has revealed that these areas may be expected to (1) constitute a relatively small percentage of the total watershed area, (2) be highly variable from season to season, year to year, and basin to basin, and (3) be in close proximity to streams. The sediment-contributing area during high basin moisture spring conditions is essentially equivalent to the runoff-contributing area. Areas contributing runoff during low moisture conditions in the spring and fall are considered to be potential rather than active sediment-producing areas. High sediment-producing areas are located close to stream channels, but the distribution and significance of sediment-producing categories and their location varies from basin to basin. Management strategies for controlling sediment production in agricultural areas should therefore be closely linked to a consideration of sediment source areas and their variability in time and space. SOME BASIC CONCEPTS OF WAVE SEDIMENT TRANSPORT,
Technical Univ. of Denmark, Lyngby. Inst. of Hydrodynamics and Hydraulic Engineering.
P. Nielsen.
Series Paper No 20, 1979. 160 p, 61 Fig, 3 Tab, 99 Ref, 1 Append.

Descriptors: *Sediment transport, *Reviews, *Model studies, *Boundary processes, *Beds, Waves(Water), Analytical techniques, Sediment-water interfaces, Suspended solids, Sediments, Shape, Beds under water, Movement, Theoretical analysis, Mathematical models, Flow, Drag, Bed load, Suspension, Ripple marks, Oscillatory flow, Incipient motion.

The literature on the basic mechanisms of wave sediment transport was reviewed. New theoretical and empirical results were presented concerning the motion of suspended particles, the magnitude and distribution of suspended sediment concentrations, and the geometry of bed forms under waves. A predictive model for sediment transport under waves and weak currents was presented. An analysis of the model revealed that the weakest point of our present-day knowledge on wave sediment transport is the description of the steady flow components near the bottom. Experimental results obtained during the study were listed in the appendix. (Humphreys-ISWS)

Mausam, Vol 30, No 4, p 449-456, October 1979. 9 Fig, 3 Tab, 20 Ref.

Descriptors: *Rain water, *Trace elements, *Monsoons, Rainfall, Chemicals, Chemistry of precipitation, Precipitation(Atmospheric), Water chemistry, Pollutants, Sea water, Sodium, Chlorine, Bromine, Iodine, Manganese, Calcium, Magnesium, Potassium, Sampling, Data processing, Regression analysis, *India.

A large number of rainwater samples were collected at three locations in Bombay city and were analyzed for sodium, chlorine, bromine, iodine, manganese, calcium, magnesium, and potassium. A few rainwater samples were also collected on board a ship, over the Arabian Sea, and were analyzed. The results showed that the seasalt aerosols predominate the trace element composition of the rainwater. Effect of industrial pollution was localized. The average Cl/Na ratio for all samples was near the seawater ratio of 1.8 while Br and I showed, respectively, a small and a very large enrichment relative to Na from seawater. The results indicated that K is enriched in the transfer from seawater to air while Mg is not. Large Ca excesses were measured in the samples, and a need for a correct evaluation of the source of this excess Ca was indicated. (Sims-ISWS)

Chemical analysis suggests that bacterial denitrification is the source of nitric and nitrous oxides in sediment samples taken from Kysing Fjord, a shallow, brackish basin off Jutland, Denmark. Peak denitrification activity occurs 1-3 cm below the sediment surface and only a little activity occurs at low nitrate concentrations in the transition zone. Nitric and nitrous oxide accumulations are not associated with the main zone of denitrification activity; instead, the maximum is located at the lower edge of the activity profile. A secondary denitrification zone occurs in the deeper layers of cores which contain brown, oxidized patches in the black, sulfide-rich layers below the transition zone; these patches are apparently induced by macrofauna burrowing activity. Most cores contain sediment that is oxidized to 5 cm depth as judged from brown coloration and surface layer positive redox potentials. The transition zone towards deeper, reduced layers with negative redox potentials is usually 1-2 cm. Nitrate concentrations decline rapidly with depth, from maximum close to the sediment surface to low values at the transition zone. Nitric and nitrous oxide maxima are located at the transition zone. Nitrous oxide peak concentrations are always less than 5 micro M, whereas nitric oxide highest concentrations are 200 micro M. (Danovich-Wisconsin)

2L. Estuaries

NUTRIENT AND OXYGEN REDISTRIBUTION DURING A SPRING NEAP TIDAL CYCLE IN A TEMPERATURE ESTUARY,
Virginia Inst. of Marine Science, Gloucester Point; and College of William and Mary, Gloucester Point, VA. School of Marine Science.
K. L. Webb, and C. F. D'Elia.
Science, Vol 207, No 4434, p 983-985, February 29, 1980. 2 Fig, 1 Tab, 16 Ref. NSF OCE75-2041.

Descriptors: *Estuaries, *Nutrients, *Dissolved oxygen, *Tidal effects, Oxygen, Density, Nitrogen compounds, Nitrites, Ammonia, Phosphorus, Phosphorus compounds, Phosphates, Stratification, Water circulation, Tides, Tidal waters, Sampling, Data processing, Nitrogen.

Spring tidal currents produce homogeneous water columns in a number of estuaries that are moderately stratified during neap tides. In the York River estuary, this destratification redistributes ammonium and phosphate regenerated by the benthos as well as oxygen from the surface. This redistribution has significant implications for nutrient cycles, organism distributions, and the management of estuaries. (Sims-ISWS)

EFFECTS OF CONTINUOUS CHLORINATION ON ENTRAINED ESTUARINE PLANKTON,
Environmental Protection Agency, Johns Island, SC.
S. J. Erickson, and H. R. Foulk.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 44-47, January 1980. 1 Tab, 13 Ref.

Descriptors: *Chlorination, *Estuaries, *Plankton, Sea water, Chlorine, Effects, Water temperature, Salinity, Biomass, Algae, Laboratory tests, Phosphates, Analytical techniques, Chlorination effects, Adenosine triphosphate.

The effects of continuous chlorination on planktonic life as measured by adenosine triphosphate content were examined in two running seawater aquaria systems for 1 year. The first system had ninety-six 37-liter aquaria; the second system had forty 5.5-liter aquaria. Salinity was 20.9 to 28.7%; water temperature, 10.1 to 30.8C; pH, 8.0 + or - 0.2. In the first system, the mean control adenosine triphosphate concentration was 0.55 microgram/liter. In aquaria treated with sodium hypochlorite, 0.125 mg/liter reduced the adenosine triphosphate to 87.1% of mean control concentration; 0.25 mg/liter, to 77.6%; and 0.5 mg/liter, to 66.8%. In the second system, the mean control adenosine triphosphate concentration was 0.40 microgram/liter. In aquaria treated with sodium hypochlorite, 0.47 mg/liter reduced adenosine triphosphate to 74.5% of the mean control concentration; 0.94 mg/liter, to 56.7%; and 1.41, to 42.5%. (Sims-ISWS)

THE RELATION BETWEEN PORE WATER CHEMISTRY AND BENTHIC FLUXES OF NUTRIENTS AND MANGANESE IN NARRAGANSETT BAY, RHODE ISLAND,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
R. J. McCaffrey, A. C. Myers, E. Davey, G. Morrison, and M. Bender.
Limnology and Oceanography, Vol 25, No 1, p 31-44, January 1980. 6 Fig, 4 Tab, 20 Ref.

Descriptors: *Pore water, *Nutrients, *Manganese, *Benthos, *Bottom sediments, *Rhode Island, Water chemistry, Advection, Sediment-water interfaces, Benthic fauna, Diffusion, Depth, Cores, Carbon cycle, Organic matter, *Narragansett Bay(RI).

Benthic fluxes of dissolved nutrients and manganese from biologically disturbed, relatively unpolluted sediment in Narragansett Bay, Rhode Island, have been measured. Analysis of the vertical gradients of chemical species dissolved in pore waters and the uptake of 22Na from the overlying water permit evaluation of the contribution of biological advection and molecular diffusion to the transport of dissolved material across the sediment-water interface. The activity of bottom-dwelling organisms appears to be about as important as molecular diffusion in most cases. The sum of the independently estimated contributions by both mechanisms is in good agreement with integrated benthic fluxes measured in situ. Sulfate and oxygen oxidize comparable amounts of organic matter in these sediments. (Visocky-ISWS)

THE FLAX POND ECOSYSTEM STUDY: EXCHANGES OF INORGANIC NITROGEN BETWEEN AN ESTUARINE MARSH AND LONG ISLAND SOUND,
Marine Biological Lab., Woods Hole, MA.
G. M. Woodwell, C. A. S. Hall, D. E. Whitney, and R. A. Houghton.
Ecology, Vol 60, No 4, p 695-702, August 1979. 2 Fig, 1 Tab, 41 Ref. NSF AG-375.

Descriptors: *Estuarine environments, *Flax Pond(NY), *Cycling nutrients, *Long Island Sound(NY), *Nitrogen, Estuaries, Seasonal, Nitrogen compounds, Nitrites, Nitrates, Ammonia, Inorganic compounds, Anion exchange, Cation exchange, Coastal marshes, Salt marshes, Tides, Tidal effects, Nutrient budgets, Nutrient transport, Phytoplankton, New York.

From September 1972 to April 1974 water samples were collected from Flax Pond, an estuarine marsh on the north shore of Long Island, New York; the exchange of nitrogen between the marsh and Long Island Sound varied seasonally in response to several factors. The greatest variation occurs in nitrate; concentrations range 1.3-230 microg N/l. Nitrogen as ammonium ion occurs at concentrations 6-106 microg N/l; and nitrite in concentrations of 30-310 microg N/l. All three ions follow seasonal patterns that are similiar: highest concentrations are in winter, lowest are in spring during phytoplankton blooms. The largest gross movements of inorganic nitrogen occur during winter when concentrations are high and when up to 85 kg of nitrate-nitrogen are exchanged between Flax Pond and Long Island Sound on each tide. The largest net exchange occurs in late summer-early fall as ammonium is lost from Flax Pond to Long Island Sound. However, the annual net exchange of inorganic nitrogen does not differ significantly from zero since inorganic nitrogen lost in summer through outward exchange with Long Island Sound is replaced in winter through inward exchange. Crude estimations of the total inorganic nitrogen budget of Long Island Sound suggest that estuaries, precipitation, and rivers each contribute approximately equal inputs. (Harris-Wisconsin)

THE EFFECTS OF IRRIGATION WITH MEATWORKS-FELLMONGERY EFFLUENT ON WATER QUALITY IN THE UNSATURATED ZONE AND SHALLOW AQUIFER,
Canterbury Frozen Meat Co. Ltd. Christchurch (New Zealand).
G. M. Keeley, and B. F. Quin.
Progress in Water Technology, Vol 11, No 6, p 369-386, 1979. 6 Fig, 7 Tab, 23 Ref.

Descriptors: *Irrigation, *Waste water disposal, *Groundwater, Pollutants, Nitrates, Nutrients, Bacteria, Sampling, Path of pollutants, Pastures, Grazing, Drainage, Effluents, Soils, Soil water, Soil contamination, Water quality, *Meatworks-fellmongery wastes.

Land application of meatworks-fellmongery effluent has been carried out at Fairton in Canterbury (New Zealand) for 80 years. Approximately 900 mm of effluent is applied annually to 100 ha of shallow soil (overlying gravels), which is bordered for surface irrigation, sown in pasture, and used for fattening beef. Because of the high nutrient content of the effluent, much of which is attributable to the fellmongery operation, soil fertility has quickly been increased to the point where the majority of most nutrients (phosphorus being a notable exception) are lost in the drainage. Investigation showed that the chemical composition of the drainage became more homogeneous with depth. The drainage (which also totaled 900 mm annually) and effluent contained similar concentrations of the species relatively unaffected by soil processes (Cl, Na, and S04-S), but the 100 mg/liter of N in the effluent, most of which was present as NH4-N, was replaced by N03-N in the drainage, although the lower concentration (40 mg/liter) suggested that denitrification losses were considerable. Despite the shallow nature of the soil, bacterial numbers in the gravel substrata were much lower than in the topsoil. The chemical composition of the groundwater beneath the scheme, where the water table is 21 m below ground level, was similar to that of drainage collected from a depth of 6 m. A three-depth investigation well situated 500 m from the scheme in the direction of groundwater flow showed definite chemical and bacteriological contamination from the effluent irrigation scheme only in the shallowest of the three depths. 4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

URBAN STORMWATER MANAGEMENT, PROCEEDINGS OF A SOUTHEAST REGIONAL CONFERENCE, NORTH CAROLINA STATE UNIVERSITY, APRIL 10-11, 1979.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-164627, Price codes: A08 in paper copy, A01 in microfiche. Water Resources Research Institute, University of North Carolina, Raleigh. (1980) edited by Howells, D. H. 258 p. OWRT B-123-NC(6), 14-34-0001-9144.

Descriptors: *Storm water, *Urban runoff, *Storm runoff, *Urbanization, Water management(Applied), Erosion control, Drainage programs, Water control, Sedimentation, Flood plain zoning, Conferences, Documentation, Southeast U.S.

Proceedings of an invitational conference to identify and prioritize water resource problems and to define research and technology transfer needs for the Southeastern United States are presented. Water resources research institutes and water resource agencies in the following states were involved: Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina, Tennessee, and Virginia. The theme of the conference was urban stormwater management with emphasis on drainage and detention, flood plain management, erosion and sedimentation control, and stormwater pollution control. The strengths and deficiencies of State and local urban stormwater management programs were examined and necessary steps to correct these weaknesses were discussed. Following the State, local, and regional program discussion two other papers were given: 'A Western Experience in Stormwater Management' and 'National Water Policy and Urban Stormwater Management'. Also given in the proceedings is a 'Model Surface Water Runoff Control Ordinance' for Florida. A list of conference participants is included. (Seigler-IPA)

Progress in Water Technology, Vol 11, No 6, p 501-520, 1979. 1 Fig, 13 Tab, 2 Ref.

Descriptors: *Land use, *Water quality, *Water yield, *Model studies, Mathematical models, Pollutants, Pathogenic bacteria, Phosphates, Nitrates, Pesticides, Oil, Heavy metals, Sediments, Heat, Water resources, Water supply, Watersheds(Basins), Agriculture, Domestic water, Surface waters.

This paper presented a summary of a Masters of Environmental Science thesis which developed two conceptual models predicting the effect of a combination of land features, land use, and land management on water quality and yield, and how the end use of water and its treatment would affect the suitability for use. Limited testing of the water yield submodel demonstrated how the models may be optimized. Both models may be combined for optimization of total water management strategies. (Sims-ISWS)

EVALUATION OF METHODS FOR ESTIMATING GROUND-WATER WITHDRAWALS IN WESTERN KANSAS,
Geological Survey, Lawrence, KS. Water Resources Div.
C. H. Baker, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-175631, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-92, 1979. 70 p, 3 Fig, 1 Tab, 6 Ref.

Descriptors: *Methodology, *Estimating, *Groundwater mining, *Withdrawals, *Kansas, Aquifers, Analytical techniques, Sampling, Pumping, Water utilization, Irrigation, Crops, Evaluation, *Western Kansas.

Individual users report ground-water withdrawals annually to the Kansas State Board of Agriculture. It is estimated that these values are 10 to 15 percent higher than actual values because most users do not possess the means for accurately determining discharge rates. Methods of estimating groundwater use in western Kansas that appear to offer the desired accuracy include (1) extrapolation from a sample of metered withdrawals, (2) calculation from precipitation and irrigated acreages of various crop types, and (3) calculation from a sample of power-coefficients. All three methods are being tested and compared with actual measured values. Newly developed electronic running-time and discharge-totaling meters are being tested that may give accurate values of total pumping time and discharge at small cost. (Kosco-USGS)

WATER RESOURCES OF THE SANTA ROSA INDIAN RESERVATION AND VICINITY, RIVERSIDE COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
A. Buono, W. R. Moyle, Jr., and P. Dana.
Available from: OFSS/USGS Box 25425, Fed. Ctr. Denver, CO, Paper copy $4.50 Microfiche $3.50. Geological Survey open-file report 79-1172, September 1979. 32 p, 8 Fig, 3 Tab, 27 Ref.

Descriptors: *Groundwater resources, *Indian reservations, *California, *Surface waters, *Water quality, Chemical analysis, Sampling, Sites, Drilling, Test wells, Potential water supply, Aquifer characteristics, Geology, Data collections, Measurement, Water levels, Streamflow, Precipitation(Atmospheric), Runoff, Evapotranspiration, *Santa Rosa Indian Reservation(Calif).

Additional water for irrigation is needed by the Santa Rosa Indian Reservation, Riverside County, California. Water in the area is derived from precipitation, which averages 12 inches annually, on three subbasins nearly surrounding the 17-square-mile reservation. No ground water flows in from outside the area. A supply well that taps sandy material overlying the pre-Tertiary basement complex showed a specific capacity of 0.4 gallon per minute per foot of drawdown. Estimates of specific yield for material encountered during drilling of three wells and a test hole ranged from 5 to 10 percent. A gravity survey outlined the thickest section of the aquifer in the Vandeventer Flat area, and test wells are proposed to determine its potential well yield. Damming streams to retain runoff (about 1,500 acre-feet per year, and more during periods of heavy precipitation) is also proposed. Analyses of water from the supply well and five major springs showed that ground water is suitable for irrigation except at Sulphur Spring, where the percent sodium of 97 exceeds recommended maximums, and at Bull Canyon Spring, where the specific conductance of 1,300 micromhos indicate a salinity hazard. (Kosco-USGS)

RESULTS OF TRANSIENT SIMULATIONS OF A DIGITAL MODEL OF THE ARIKAREE AQUIFER NEAR WHEATLAND, SOUTHEASTERN WYOMING,
Geological Survey, Cheyenne, WY. Water Resources Div.
D. T. Hoxie.
Available from: OFSS, USGS Box 25425, Fed. Ctr. Denver, CO 80225, Paper copy $2.00, Microfiche $3.50. Geological Survey open-file report 79-1280, 1979. 17 p, 7 Fig, 3 Tab, 4 Ref.

Descriptors: Model studies, *Simulation analysis, *Aquifer characteristics, *Wyoming, Projections, Computer models, Hydrogeology, Groundwater resources, Pumping, Industrial water, Irrigation wells, Water levels, Drawdown, *Arikaree aquifer(Wyo), *Southeastern Wyoming.

Revised ground-water pumpage data have been imposed on a ground-water flow model previously developed for the Arikaree aquifer in a 400 square-mile area in central Platte County, Wyo. Maximum permitted annual ground-water withdrawals of 750 acre-feet for industrial use were combined with three irrigation-pumping scenarios to predict the long-term effects on ground-water levels and streamflows. Total annual ground-water withdrawals of 8,806 acre-feet, 8,033 acre-feet, and 5,045 acre-feet were predicted to produce average water-level declines of 5 feet or more over areas of 99, 96, and 68 square miles, respectively, at the end of a 40-year simulation period. The first two pumping scenarios were predicted to produce average drawdowns of more than 50 feet over areas of 1.5 and 0.8 square miles, respectively, while the third scenario resulted in average drawdowns of less than 50 feet throughout the study area. In addition, these three pumping scenarios were predicted to cause streamflow reductions of 2.6, 2.0, and 1.4 cubic feet per second, respectively, in the Laramie River and 4.9, 4.7, and 3.7 cubic feet per second, respectively, in the North Laramie River at the end of the 40-year simulation period. Descriptors: *Hydrologic data, *Water supply, *Planning, *Kansas, *Hydrogeology, Data collections, Groundwater, Water wells, Water levels, Water yield, Chemical analysis, Sites, Climatic data, Observation wells, Rainfall, Soil moisture, Crop production, Solar radiation, Aquifers, Drawdown, Pumping, Irrigation wells, Water conservation, Irrigation, Water management(Applied), *Wichita County(Kans).

Data are presented that result from an intensive geohydrologic study for water-supply planning in a 12-square-mile area in northeastern Wichita County, Kansas. These data include records of wells, test drilling, chemical analyses, groundwater levels, rainfall, soil moisture, well yield, solar radiation, crop yield, and crop acreage. Data indicate that water levels in the unconsolidated aquifer are declining at an average annual rate of about 1 to 2 feet per year (1950-78). This decline is the aquifer's response to pumping by irrigation wells for watering corn, wheat, grain sorghum, and other crops. (Kosco-USGS)

CONJUNCTIVE WATER USE,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. M. Yevjevich.
Water International, Vol 4, No 3, p 17-24,30, September, 1979. 4 Fig.

Descriptors: *Conjunctive use, *Water management(Applied), *Water sources, Multi-purpose projects, History, Social impact, Economic justification, Legal aspects, Environmental effects, Political constraints, Computer models, Decision making, Optimization, Properties, Estimating, Systems analysis, Optimum development plans, Project planning, Water resources development, Water utilization, Water quality, Research priorities, Alternative water use.

The historical development of water resources planning and management over the last 100-150 years is reviewed. The present state-of-the-art is conjunctive use in the form of multi-structure, multi-purpose, and multi-source water resources systems. Basic concepts and dimensions of conjunctive water use are discussed with emphasis on integration of the water resources systems into the economic, social, environmental, legal, and political systems. Before a multi-source conjunctive use model can be developed, the following must be established: (1) commonalities and specificities of properties of various combinations of water sources; (2) basic, theoretically and experimentally verifiable, approaches to decomposition and recomposition of complex water resources systems; and (3) identification of subsystem properties, input, states and output processes. Optimization of decision making may follow general operational rules and equations, or a continual, real time approach. Several examples of conjunctive water use schemes are presented. These schemes depend on: (1) the number and position of water sources in relation to the user(s); (2) whether water(s) should be shifted between sources for any beneficial purpose; (3) whether water will flow through a conveyance structure uni-directionally or bi-directionally; and (4) topographical and economic constraints. Three avenues of research in conjunctive water use technology and the role of water quality are discussed. (Purdin-NWWA)

GROUND WATER MANAGEMENT IN GEORGIA,
Georgia Univ., Athens. Legislative Research Div.
J. E. Kundell.
Ground Water, Vol 18, No 1, p 77-79, January-February, 1980. 2 Fig, 2 Tab, 5 Ref.

Descriptors: *Ground water, *Water management(Applied), *Georgia, Water utilization, Withdrawal, Overdraft, Industrial plants, Surface water, Urbanization, Irrigation programs, Geomorphology, Land use, Geology, Water allocation(Policy), Water permits, State governments, Agriculture, Water rights.

Water quantity, rather than quality, is becoming increasingly important, not only in arid western states but also in humid eastern states like Georgia

which receives about 50 inches of precipitation annually. The Coastal Plain Province is the only area in Georgia underlain by extensive aquifers and is used for agriculture, forestry and recreation. Other areas depend primarily on surface water and are mainly urban/industrial. Industries are the major users of ground water but between 1970 and 1977 withdrawals have decreased by about 9% due to conservation measures and the use of more surface water. Rapid growth in agricultural irrigation has resulted in withdrawals increasing from 11% in 1970 to 18% of the total ground water use by 1977. Since 74% of the irrigation occurs in the southwestern portion of the State, historic lows were recorded in aquifers in the area during November, 1978. Irrigation withdrawals were exempted from the permit requirements of the 1972 Ground Water Use Act. This has led to an inability to manage the resource and questions regarding legal rights to the use of water. Measures may be taken during the 1980 session of the Georgia General Assembly to enable better management of the State's water resources. (Purdin-NWWA)

APPLICATION OF GEOMORPHIC PRINCIPLES TO ENVIRONMENTAL MANAGEMENT IN SEMIARID REGIONS,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
S. A. Schumm, M. T. Bradley, and Z. B. Begin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-169303, Price codes: A04 in paper copy, A01 in microfiche. Colorado Water Resources Research Institute, Colorado State University Completion Report No 93, February 1980. 43 p, 15 Fig, 27 Ref. OWRT B-150-COLO (2), 14-34-0001-7143.

Descriptors: *Erosion, *Geomorphology, *Terrain analysis, *Semiarid climates, Land management, Evaluation, Soil stability, Vegetation, Accelerated erosion, Gully erosion, Valleys, *Erosion control.

In many valleys of the semiarid West valley floors are either flat and vegetated without a channel, or they are gullied. Using previously collected data from the Piceance Creek area of western Colorado, it is possible to identify a valley-slope threshold above which, for a given drainage area, gullying is probable. Below this valley-slope threshold the valley floors are stable; above it they are susceptible to gullying. When the relations and techniques developed in western Colorado were applied to the Chalk Bluffs area of northeastern Colorado, it was determined that valley width was also a significant factor determining valley stability, and a ratio of valley slope to valley width could be used to identify at a given drainage area a threshold zone of valley floor instability. These relations explain the observed variability of gullies and also permit identification of those locations where gullying is probable.

Journal of the Water Pollution Control Federation, Vol 52, No 1, p 161-172, January 1980. 8 Fig, 2 Tab, 14 Ref. EPA R-804431.

Descriptors: *Groundwater recharge, *Recharge wells, *Injection wells, *Pollutants, *Organic compounds, Path of pollutants, Water pollution, Groundwater, Recharge, Chemicals, Reclaimed water, Waste water(Pollution), On-site investigations, Observation wells, Chemical analysis, Analytical techniques, Pollutant identification.

Concentration changes of organic trace contaminants were measured in an aquifer that was being recharged by direct injection of reclaimed water. The reclaimed water was obtained by advanced treatment of secondary effluent, including lime addition, coagulation, and sedimentation; air stripping; recarbonation; ozonation; and sand filtration. Naphthalene showed evidence of biodegradation in the aquifer. The field retention capacity of chlorobenzene was approximately 0.32 g/cu m aquifer in equilibrium with a concentration of 4 micrograms/liter in the water. The ratio of chlorobenzene transport relative to water movement was approximately one thirty-sixth. Chloroform was transported more rapidly than chlorobenzene, approximately one-fifth as fast as water. The approach showed promise for predicting water quality behavior in a large-scale groundwater recharge project based on short-term observations near the injection well. Concentrations were in the range of 0.1 to 10 micrograms/liter. (Sims-ISWS)

THE EFFECTS OF LAND USE AND HYDROLOGY ON GROUNDWATER QUALITY IN MID-CANTERBURY, NEW ZEALAND,
Ministry of Agriculture and Fisheries, Ashburton (New Zealand). Winchmore Irrigation Research Station.
B. F. Quin, and R. J. Burden.
Progress in Water Technology, Vol 11, No 6, p 433-448, 1979. 5 Fig, 2 Tab, 20 Ref.

Descriptors: *Land use, *Hydrology, *Groundwater, *Water quality, Irrigation, Agriculture, Pastures, Grazing, Sampling, Water chemistry, Nitrogen compounds, Nitrates, Chlorine, Nutrients, Pollutants, Geology, Recharge, Water pollution, *New Zealand.

Groundwater quality in Mid-Canterbury, New Zealand, between the Rakaia and Ashburton rivers (an area of 300,000 ha) can be classified into three distinct zones based on land use and hydrology. Zone A contains 0-3.5 g/cu m N03-N and 0-5 g/cu m Cl and consists primarily of runoff from the foothills and seepage from the rivers. Zone B, which contains 6-12 g/cu m N03-N and 5-10 g/cu m Cl, is situated beneath and downstream of a 26,000-ha surface irrigation scheme and consists primarily of drainage from this scheme. Zone C contains 5-20 g/cu m N03-N and 10-30 g/cu m Cl and lies beneath nonirrigated land that is not adjacent to major river recharge areas. The groundwater in this zone consists of varying proportions of drainage from surface-irrigated, spray-irrigated, and nonirrigated land, and seepage from the rivers. Future trends in groundwater quality were discussed in the light of these results. (Sims-ISWS)

NITRATE AND CHLORIDE IN GROUNDWATER, SURFACE WATER AND DEEP SOIL PROFILES OF CENTRAL CANTERBURY, NEW ZEALAND,
Lincoln Coll., (New Zealand). Dept. of Soil Science.
J. A. Adams, A. S. Campbell, W. R. McKeegan, R. J. McPherson, and P. J. Tonkin.
Progress in Water Technology, Vol 11, No 6, p 351-360, 1979. 6 Fig, 1 Tab, 7 Ref.

Descriptors: *Nitrates, *Groundwater, *Surface waters, Chlorides, Agricultural runoff, Water wells, Aquifers, Sampling, Chemical analysis, Nitrogen, Nitrogen compounds, Water pollution, Water pollution sources, Pollutants, Path of pollutants, Water quality, *New Zealand, Trends.

Nitrate-N levels were found to be high in household groundwater wells and surface waters in the Lincoln area of Central Canterbury, New Zealand. A majority of Lincoln wells contained more than the limit for public water supplies of 10.2 mg/dm of nitrate-N recommended by the World Health Organization, whereas the majority of groundwater wells in other areas of Central Canterbury contained less than 5 mg/dm. A similar pattern occurred in surface waters, although nitrate-N levels were always lower than in groundwater. Nitrate-N levels decreased with well depth and fell to less than 1 mg/dm in wells tapping the deep (more than 35 m) confined artesian aquifer. Temporal variation in nitrate-N levels was investigated by weekly sampling of 12 Lincoln household

groundwater wells and 2 stream sampling sites in Lincoln. Nitrate-N levels were variable but rose significantly over the year with levels being highest and the rate of increase being greatest on the western side of Lincoln. The reason for the rapid increase in nitrate-N levels is unknown. Baseline stream nitrate-N levels were low but were considerably affected by groundwater inflows and point pollution sources. Chloride levels in groundwater and surface water were closely correlated with nitrate-N levels. Nitrate-N levels in the soil solution under more freely drained agricultural soils near Lincoln were similar to those observed in groundwater, suggesting that agriculture may be making a contribution to the nitrate-N load of groundwater in the study area. This is despite the fact that nitrogenous fertilizers are not widely used. On poorly drained soils, no evidence of vertical movement of nitrate was observed. (Sims-ISWS)

DIURNAL OXYGEN RHYTHM AND PRIMARY PRODUCTION IN THE MIXED LAYER OF THE ATLANTIC OCEAN AT 20 DEGREES N,
Nederlands Inst. voor Onderzoek der Zee, Texel.
S. B. Tijssen.
Netherlands Journal of Sea Research, Vol 13, No 1, p 79-84, October 1979. 2 Fig, 10 Ref.

Descriptors: *Dissolved oxygen, *Analytical techniques, *Primary productivity, *Atlantic Ocean, *Estimating, Volumetric analysis, Diurnal, Variability, Mixing, Surface waters, Oxygen, Measurement, Chemical analysis, Testing procedures, Water chemistry, On-site investigations, On-site laboratories, Tracers.

Oxygen concentrations varied 415-426 microg at/cu dm November-December 1978 in Atlantic Ocean mixed layers; these high values provide substantial evidence that past C14 primary production estimates for the oceans are severe underestimates. Past calculations of diurnal oxygen variation in oceanic mixed layers estimated that primary production was 150-250 mg C/sq m d. Measurements were based on a maximum diurnal oxygen variation of 0.5-1 microg at/cu dm, indicating 0.1-0.2% variation in oxygen solubility at ambient salinity and temperature conditions. Measuring such small differences is beyond the precision of standard Winkler methods. For these experiments a phototritrator was built with a high precision endpoint determination, giving 0.05-0.1% standard error. Diurnal oxygen rhythms with amplitudes $<0.6\%$ ambient oxygen concentrations occur at five stations in the mixed layer of the Atlantic Ocean at 20 degrees N. Oxygen concentrations per cast within the mixed layer at different depth levels are remarkably constant. Mean standard deviation within the mixed layer at one station is only 0.29 microg at/cu dm. High concentrations are occasionally found in the upper 10 m. Evening oxygen concentrations are consistently and significantly higher than morning concentrations, allowing for light period increase and dark period decrease. Spatial and between-days variability never exceeds the difference between the night values and the mean of both morning casts. Estimated gross primary production in the mixed layer is high and averages 800 mg C/sq m d. (Danovich-Wisconsin)
W80-04282

CURRENT C14 METHODS FOR MEASURING PRIMARY PRODUCTION: GROSS UNDERESTIMATES IN OCEANIC WATERS,
Nederlands Inst. voor Onderzoek der Zee, Texel.
W. W. C. Gieskes, G. W. Kraay, and M. A. Baars.
Netherlands Journal of Sea Research, Vol 13, No 1, p 58-78, October 1979. 4 Fig, 7 Tab, 48 Ref.

Descriptors: *Tracers, *Primary productivity, *Analytical techniques, *Atlantic Ocean, *Estimating, Phytoplankton, Oceans, Chlorophyll, Algae, Surface waters, Sampling, Size, Volume, Mortality, Plankton, Organic matter, Euphotic zone, Fluorometry, Spectrophotometry.

Primary production measurements were made in situ in the North Equatorial Current, Atlantic Ocean November-December 1978; amounts of organic matter produced through autotrophic processes in tropical open ocean euphotic zones is 5-15 times higher than values derived from common C14 methods. The new estimates are based on measurements of C14 incorporation in organic matter of ocean samples incubated in 4 liter bottles; primary production estimates vary 100-750 mg C/sq m d. Incubation in smaller bottles causes abnormally high photochemical pigment destruction, presumably due to enhanced algal mortality. Detrimental enclosure effects are most serious in samples contained in 30 ml bottles for 12 hrs; effects are not significant in samples larger than 4 liters. Mortality in bottles may be caused directly by contact with glass walls, or indirectly because organic matter production and consumption in oligotrophic waters is easily upset when samples are enclosed. In uppermost euphotic layers, primary production is further underestimated because chlorophyll in algal cells incubated at a fixed depth bleaches more rapidly than chlorophyll in cells freely circulating in vertically mixed surface layers. Oceanic phytoplankton have high growth rates, with generation times in hours, not days. High heterotrophic activity takes place in conjuction with high organic matter primary production. Therefore, existing concepts of open ocean carbon cycling and solar energy conversion efficiencies need to be completely reconsidered since they have always been based on extremely low primary production values. Descriptors: *Testing procedures, *Pesticides, *Pollutant identification, *Analytical techniques, *Waste water(Pollution), Chromatography, Centrifugation, Waste identification, Chemical analysis, Water pollution sources, Aldrin, DDT, Dieldrin, Heptachlor, Chlorinated hydrocarbon.

Raw waste water from the municipal sewage treatment plant in Brockton, Massachusetts, was used to test the applicability of the Environmental Protection Agency protocol for screening industrial effluents for priority pollutions. Samples were analyzed both before and after dosing with 1-30 ppb of priority pesticides and PCB's. Among the pollutants tested for were alpha-, beta-, gamma-, and delta-BHC; heptachlor; aldrin; dieldrin; endrin; chlordane; toxaphene; arochlors; and others. The industrial protocol was adapted for raw waste water samples and the tests were designed to allow for the measurement of losses involved in each step. Protocol evaluation steps are: (1) extraction with 15% methylene chloride/hexane and centrifugation, (2) concentration by Kuderna-Danish evaporation, (3) interference removal by acetonitrile partition, (4) chromatography on Florisil and Sephadex LH-20, and (5) mercury treatment for sulfur removal. Assays were performed by gas chromatography using an electron capture detector. Results show that unless evaporation is performed rapidly the Kuderna-Danish step could cause significant sample loss. The use of mercury for extract clean up produces no significant pesticide loss. Use of the Sephadex LH-20 is recommended over the Florisil due to several clean up advantages. While the tested protocol worked well with pollutants at the ppb level there is some question about resolution at the ppt level. (Seigler-IPA)

DESCRIPTION AND USE OF AN IMPROVED METHOD FOR DETERMINING ESTUARINE ZOOPLANKTON GRAZING RATES ON PHYTOPLANKTON,
New Univ. of Ulster, Coleraine (Northern Ireland). Limnology Lab.

F. B. Griffiths, and J. Caperon.
Marine Biology, Vol 54, No 4, p 301-309, 1979. 2 Fig, 4 Tab, 31 Ref.

Descriptors: *Zooplankton, *Phytoplankton, *Estimating equations, *Analytical techniques, *Grazing, Tracers, Radioactivity techniques, Feeding rates, Sampling, South West Arm(Australia), Port Hacking(Australia), Sydney(Australia), Australia, Plant populations, Estuarine environments, Standing crops, Estuaries, Laboratory tests, Saturation, Population dynamics.

A method developed for estimating zooplankton grazing rates on natural mixed phytoplankton populations does not depend on counting phytoplankton cells at the beginning and end of each experiment. The method involves adding C14-labelled, natural mixed phytoplankton populations, either as sole grazing substrate or as tracer, to mixed phytoplankton and zooplankton samples at ambient and above-ambient concentrations. Appearance rates of C14-labelled phytoplankton in zooplankton estimates the grazing rate. Experiments were conducted to measure following variables: (1) total zooplankton grazing rate; (2) phytoplankton concentrations necessary for saturated grazing to occur; (3) individual species grazing rates at ambient concentrations of both phytoplankton and zooplankton. Grazing rate constants for net-caught zooplankton concentrated to 46 and 28 times ambient estuarine levels are -0.14 and -0.12 phytoplankton standing stock/d, respectively. Amounts of phytoplankton grazed increase with increasing phytoplankton concentrations. The onset of saturated grazing occurs at concentrations 46 times ambient estuarine levels. However, observations were insufficient to establish absolute numerical values for saturated grazing. Experimental grazing rates, applied to phytoplankton standing stocks, October-November 1975 in South West Arm, Port Hacking, Australia, showed that zooplankton grazing was the major control factor of phytoplankton populations. INTERACTIONS BETWEEN VASCULAR ACTIONS OF DETERGENT AND CATECHOLAMINES IN PERFUSED GILLS OF EUROPEAN EEL, ANGUILLA ANGUILLA L. AND BROWN TROUT, SALMO TRUTTA, L.,
Messina, Univ. (Italy). Dept. of Physiology.
L. Bolis, and J. C. Rankin.
Journal of Fish Biology, Vol 16, p 61-73, 1980. 9 Fig, 47 Ref.

Descriptors: *Toxicity, *Eels, *Brown trout, *Linear Alkylate Sulfonates, Animal physilogy, Detergents, Biochemistry, Inhibition, Animal metabolism, Chemical properties, Cytological studies, Mode of action, *Catecholamines, *Noradrenaline, *Gills, *Propanolol, *Tissue analysis.

Noradrenaline induced vasodilation in isolated perfused eel or trout gills was inhibited by propranolol, a beta - adrenergic blocking agent. The noradrenaline effect was much reduced in gills of fish which had been kept in 1 mg/l solutions of the detergent LAS (linear alkylate sulphonate; 12C chain length). LAS produced concentration-dependent vasodilation, which was inhibited by propranolol, in eel and trout gills. Noradrenaline produced additional vasodilation in eel and trout gills which had been dilated by 2 times ten to the minus eighth power M LAS but had no effect on trout gills perfused with 2 times ten to the minus seventh power M LAS. Gills from trout which had been kept in 0.1 mg/l LAS responded to noradrenaline normally but the propranolol inhibition appeared to be potentiated. (Deal-EIS)

EFFECTS OF SALINITY ON VEGETATION CONSUMPTION AND GROWTH IN GRASS CARP,
Florida, Univ., Gainesville. School of Forest Resources and Conservation.
M. J. Maceina, and J. V. Shireman.
The Progressive Fish-Culturist, Vol 42, No 1, p 50-53, 1980. 1 Tab, 26 Ref.

Descriptors: *Carp, *Salinity, *Growth rates, *Feeding rates, Habitats, Fry, Water chemistry, Toxicity, Fish behavior, Fish physiology, Salt tolerance, Brackish water, Freshwater fish, Animal metabolism, Grass carp, Estuaries.

Fingerling grass carp (Ctenopharyngodon idella), 90-130 mm long, were fed a satiation diet of duckweed (Lemna minor) at different salinities for a 14-day period. Daily food consumption ranged from 5.8 to 6.4% of body weight in fish held at salinities between 0.1 (fresh water) and 6 o/oo, declined significantly to 1.3% at 9 o/oo, and was nil at 12 o/oo. Dietary conversion rates of grass carp were less efficient at 3 and 6 o/oo salinity than in fresh water. Growth was reduced slightly at salinities of 3 and 6 o/oo and greatly at 9 o/oo. Consumption, growth, and survival data obtained in this study indicate that grass carp could inhabit brackish water estuaries and salt marshes of salinities up to 9 o/oo. (Deal-EIS)

THE EFFECT OF DISSOLVED OXYGEN AND SALINITY ON THE TOXICITY OF AMMONIA TO SMOLTS OF SALMON, SALMO SALAR L.,
Water Pollution Research Lab., Stevenage (England).
J. S. Alabaster, D. G. Shurben, and G. Knowles.
Journal of Fish Biology, Vol 15, p 705-712, 1979. 4 Fig, 2 Tab, 21 Ref.

Descriptors: *Dissolved oxygen, *Ammonia, *Toxicity, *Salinity, *Atlantic salmon, Mortality, Bioassay, Lethal limit, Water chemistry, Hardness(Water), Fish physiology, Salmonoids, Fish migration, *Acclimation.

The survival of Atlantic salmon smolts on exposure to constant concentrations of ammonia has been measured under laboratory conditions. At concentrations of dissolved oxygen close to the air-saturation value, the 24-h LC50 of unionised ammonia is 0.15 mg NH3/l in fresh water (hardness 264 mg/l as CaCO3) and 0.3 mg NH3/l in 30% sea water. At concentrations of dissolved oxygen of 3.5 mg/l in fresh water and 3.1 mg/l in 30% sea water, the 24-h LC50 is 0.09 mg NH3/l and 0.12 mg NH3/l respectively. For fish acclimated for 1 day to a concentration of ammonia close to the 24-h median for un-acclimated fish, the median is increased between 38 and 79%, depending on test conditions. (Deal-EIS)

THE EFFECTS OF INTERACTING SALINITY, CADMIUM, AND MERCURY ON POPULATION GROWTH OF AN ARCHIANNELID, DINOPHILUS GYROCILIATUS,
Oslo Univ. (Norway). Inst. of Marine Biology.
K. H. Roed.
Sarsia, Vol 64, p 245-252, 1979. 4 Fig, 6 Tab, 17 Ref.

Descriptors: *Salinity, *Mercury, *Cadmium, *Toxicity, Growth rates, Reproduction, Inhibition, Lethal limit, Mortality, Bioassay, Animal populations, Aquatic populations, Invertebrates, Worms, *Multivariate analysis, *Dinophilus.

After determining the 48-h LC50 values for cadmium and mercury, the long-term effects of 5% and 10% of these concentrations together with varying salinity on population growth progress of Dinophilus gyrociliatus O. Schmidt were investigated. Both the population growth rate and the time for the first generation to start reproduction have been studied. Significant effects were found for both two and three factor interactions. Using response surface methods, cadmium and mercury in combinations were shown to have increased effect as the salinity decreased and the two factor interactions were shown to change from antagonism at 30 o/oo to synergism at 25 o/oo. BEHAVIOURAL STUDIES ON MUSSELS UNDER CHANGING ENVIRONMENTAL CONDITIONS,
Magyar Tudomanyos Akademia, Tihany. Biological Research Inst.
J. Salanki.
Symposia Biologica Hungarica, Vol 19, p 169-176, 1979. 5 Fig, 20 Ref.

Descriptors: *Bioindicator, *Mussels, *Heavy metals, Animal behavior, Mercury, Cadmium, Insecticides, Herbicides, Pesticide toxicity, Water quality, Copper, Lead, *Anodonta.

The pumping behaviour of the fresh water mussel (Anodonta cygnea L.) was investigated under laboratory conditions with reference to artificial environmental factors, namely the presence of various pollutants. The continuous recording of shell activity and evaluation of changes in activity proved to be good indicators for testing the effect of chemicals. Mussels are rather sensitive to sulfhydryl blocking agents (Hg, Cd), which cause a marked shortening in their active periods. Some insecticides and herbicides shortening the mussels' activity also result in the reduction of water cleaning performed by mussels. (Deal-EIS)
W80-04404

EFFECT OF SOME PESTICIDES ON THE RHYTHMIC ADDUCTOR MUSCLE ACTIVITY OF FRESH-WATER MUSSEL LARVAE,
Magyar Tudomanyos Akademia, Tihany. Biological Research Inst.
I. Varanka.
Symposia Biologica Hungarica, Vol 19, p 177-196, 1979. 14 Fig, 1 Tab, 19 Ref.

Descriptors: *Pesticide toxicity, *Mussels, *Animal physiology, Larval growth stage, Inhibition, Insecticides, Nematocides, Herbicides, 2,4-D, Surfactants, Linear alkylate sulfonates, Bioindicator, Mollusks, *Tissue analysis, *Anodonta.

The toxicity of some pesticides which may enter fresh waters was examined on the larvae of freshwater mussels. The decrease of tryptamine (TA)-induced adductor muscle activity was used as an indicator of the effect because it seemed to be suitable for the investigation of inhibitory effects. The following compounds were used: insecticides: Hungaria L-7, Dimecron-50, Thimet-10 G, Novenda, Bi-58 EC and Malathion; a nematocide: Shell-DD; herbicides: Gramoxon, Dikonirt and its active ingredient, the pure 2,4-D salt, as well as LAS, a surface-active agent. CORRELATION BETWEEN CADMIUM CONCENTRATION IN THE WATER AND TISSUE RESIDUE LEVELS IN DAB, LIMANDA LIMANDA L., AND PLAICE, PLEURONECTES PLATESSA L.,
Biologische Anstalt Helgoland, Hamburg (Germany, F.R.).
H. Von Westernhagen, V. Dethlefsen, and H. Rosenthal.
Journal of the Marine Biological Association of the United Kingdom, Vol 60, p 45-58, 1980. 8 Fig, 2 Tab, 31 Ref.

Descriptors: *Cadmium, *Absorption, *Fish physiology, Water chemistry, Heavy metals, Growth rates, Toxicity, Mortality, Juvenile growth stage, Path of pollutants, Water temperature, Animal metabolism, Animal pathology, *Tissue analysis, *Bioaccumulation, *Dab, *Limanda, *Plaice, *Pleuronectes, *Fin erosion.

Juvenile dab, Limanda limanda L., and plaice, Pleuronectes platessa L., were kept in cadmium contaminated (5 microg/l, 50 microg/l) flow-through systems for 6 and 96 days. Accumulation of cadmium was measured in backbone, fins, gills, liver, muscle (fillet), otoliths and skin (dorsal and ventral). At both cadmium concentrations there was measurable accumulation after 6 days and significant accumulation in liver and gills after 96 days. At 50 microg/l, except for otoliths, all tissues tested showed significant uptake of cadmium. Growth and condition factors were not affected by either cadmium concentration. At 50 microg/l there was extensive mortality and plaice developed fin erosion. (Deal-EIS)
W80-04407

HUMAN IMPACTS ON BIOMASS, POPULATION SIZE AND YIELD-PER-RECRUITS OF ASP (ASPIUS ASPIUS L.) IN LAKE BALATON,
Magyar Tudomanyos Akademia, Tihany. Biological Research Inst.
P. Biro.
Symposia Biologica Hungarica, Vol 19, p 125-139, 1979. 12 Fig, 2 Tab, 26 Ref.

Descriptors: *Fish management, *Fish populations, *Commercial fishing, Productivity, Biomass, Yield equations, Mathematical models, Fish conservation, Commercial fish, Fish harvest, Nets, Lakes, Growth stages, Lake Balaton, Hungary, *Asp, *Aspius.

Responses of the relatively small asp (Aspius aspius L.) population to exploitation by commercial fisheries in Lake Balaton have been analysed. Yield of asp in Lake Balaton varied between 0.007 and 0.5 kg/ha. The quantity of asp caught annually at different areas of the lake is sufficiently constant (2.2-2.57 MT). The catch-per-unit effort (CPE) varied between 456 and 646 kg/yr, the rate of exploitation of the stock proved to be about 35.6 per cent, but the rate of production (P/B) was only 28.6 per cent. Annual loss of the population is about 49 per cent and the rate of survival is 51 per cent. The selectivity of the seines used in Lake Balaton basically influences the asymmetrical population structure removing the greater and older specimens of the stock. Asp in Lake Balaton basically influences the asymmetrical population structure removing the greater and older specimens of the stock. Asp in Lake Balaton has been intensively exploited. Rates of survival and exploitation heavily affect the size and stability of the harvestable asp population especially after the prerecruit phase. Rate of exploitation varies inversely in the function of stock abundance even at constant fishing effort. Under constant fishing pressure the stability and resilience of the relatively small asp population have been decreasing. These alterations are due to shifts in age-structure of the population and fluctuations in natural recruitment. These changes can be reversed to some extent by reducing the fishing intensity and enlarging the current mesh size of seines. (Deal-EIS)

OXYGEN-REGIME AND ARTIFICIAL AERATION OF NET-CAGES IN MARICULTURE,
Kiel Univ. (Germany, F. R.). Inst. fuer Meereskunde.
U. Kils.
Meeresforschung, Reports on Marine Research, Vol 27, No 4, p 236-243, 1979. 10 Fig, 11 Ref.

Descriptors: *Dissolved oxygen, *Aquiculture, *Equipment, *Oxygenation, Aeration, Oxygen requirements, Fish farming, Fish behavior, Flow rates, Water chemistry, Research equipment, Pumps, Fish management, *Artificial aeration.

The factors modifying the oxygen-regime in net-cages are shown and problems of artificial aeration pointed out. The only important 02-source of a net cage is the water exchange through the net-cover. The 02-content of the surrounding water, the stocking density and the net-cage size determine the oxygen-regime. A simple aeration with compressed air is not suitable for net-cages, on the contrary it can aggravate a critical 02-situation. A special net-cage-aerator is introduced and tested. This compact, self-floating aerator is easy to install in net-cages, delivers 02-saturated water without redundant turbulences and has a high oxygenation-capacity. An investigation on the fish reaction demonstrated that a net-cage-aerator of the displayed construction does not annoy the fishes in the cage. A swarm-like circular swimming motion of trout indensly stocked net-cages is not upset by the running aerator. (Deal-EIS)

SEASONAL AND ENVIRONMENTAL VARIATION IN MN, FE, CU AND ZN CONTENT OF SPARTINA ALTERNIFLORA,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
J. L. Gleason, J. E. Drifmeyer, and J. C. Zieman.
Aquatic Botany, Vol 7, p 385-392, 1979. 3 Fig, 1 Tab, 23 Ref.

Descriptors: *Seasonal, *Heavy metals, *Marsh plants, Manganese, Iron, Copper, Zinc, Marshes, Aquatic plants, Plant physiology, Metabolism, Absorption, Virginia, Bennett's Marsh, Taskinas Marsh, *Bioaccumulation, *Tissue analysis.

Mn, Fe, Cu, and Zn in shoot tissue of Spartina alterniflora L. were analyzed for seasonal trends and relationships to dry matter standing crop. Two brackish marshes in Virginia were sampled four times between April and September 1975. Between early April and late May shoots accumulated Mn, Cu and Zn at a faster rate than dry matter standing crop increased. Fe followed this trend at Bennett's Marsh but matched standing crop increase at Taskinas Marsh. Tissue concentrations of Mn, Cu and Zn declined over the growing season at both marshes; Fe declined at Bennett's Marsh and increased at Taskinas Marsh. (Deal-EIS)
W80-04411

TOXICITY OF HEAVY METALS TO THE MARINE DIATOM DITYLUM BRIGHTWELLII (WEST) GRUNOW: CORRELATION BETWEEN TOXICITY AND METAL SPECIATION,
Melbourne Univ., Parkville (Australia). School of Botany.
G. S. Canterford, and D. R. Canterford.
Journal of the Marine Biological Association of the United Kingdom, Vol 60, p 227-242, 1980. 11 Fig, 3 Tab, 30 Ref.

Descriptors: *Heavy metals, *Toxicity, *Diatoms, *Mathematical models, Copper, Zinc, Cadmium, Lead, Chemical properties, Mercury, Chemical reactions, Chelation, Growth rates, *EDTA, *Silver, *Thallium.

Toxicity of copper, zinc, cadmium and lead to Ditylum brightwellii decreased as the EDTA concentration was increased. However, increasing the EDTA concentration from 6.7 x ten to the minus 7th power to .00001 M had no effect on the toxicity of mercury, silver and thallium. Using the computer program COMICS a model describing the speciation of copper, zinc, cadmium, lead, mercury, silver and thallium in Si02 Stosch-modified Schreiber medium containing 1 x ten to the minus 7th power to .00001 M EDTA was constructed. For copper, zinc, cadmium and lead the free metal concentration was dependent on the concentration of EDTA in the medium. However, for mercury, silver and thallium the free metal concentration was independent of EDTA concentration. Correlation between experimental and theoretical data shows that heavy metal toxicity to D. brightwellii was related to the free metal concentration in the medium rather than the total metal concentration. The order of metal toxicity, based on the free metal concentration, was Hg2+>Ag+>Cu2+>Pb2+>Cd2+>Zn2+>Tl+. (Deal-EIS)
W80-04414

THE SEA-WATER WELL SYSTEM AT THE FISHERIES LABORATORY, LOWESTOFT AND THE METHODS IN USE FOR KEEPING MARINE FISH,
Ministry of Agriculture, Fisheries and Food, Lowestoft, (England). Fisheries Lab.
P. Scholes.
Journal of the Marine Biological Association of the United Kingdom, Vol 60, p 215-225, 1980. 3 Fig, 2 Tab, 15 Ref.

Descriptors: *Marine fish, *Aquiculture, *Water wells, Sea water, Research equipment, Filtration, Sands, Fish management, Aquaria, Water chemistry, Fisheries, Marine fisheries, Water supply, Lowestoft, England.

A description is given of the shallow subsand seawater well system now in use at the Fisheries Laboratory, Lowestoft, England, to maintain for experimental purposes stocks of indigenous North Sea fishes. Chemical analyses of the well water show that it differs from usual inshore sea water in that it has a higher nitrate concentration and higher iron content, but fish both grow and spawn in this water and produce viable eggs and larvae. Advantages of the system are discussed. By provision of undergravel filtration fitted to individual tanks and an inflow of well water, whiting can be kept in a healthy condition at stocking densities of 10 kg cubic meter and flatfish such as dabs at 13 kg cubic meter. (Deal-EIS)

AN AQUATIC SAFETY ASSESSMENT ON LINEAR ALKYLBENZENE SULFONATE (LAS): CHRONIC EFFECTS ON FATHEAD MINNOWS,
Proctor and Gamble Co., Cincinnati, OH. Environmental Safety Dept.
W. F. Holman, and K. J. Macek.
Transactions of the American Fisheries Society, Vol 109, p 122-131, 1980. 2 Fig, 8 Tab, 28 Ref.

Descriptors: *Linear alkylate sulfonates, *Toxicity, *Minnows, Detergents, Surfactants, Life cycles, Embryonic growth stage, Larval growth stage, Chemical properties, Organic compounds, Streams, Sewage effluents, Bioassay.

Life-cycle and embryo-larval toxicity tests were conducted on the fathead minnow (Pimephales promelas) with three commercial linear alkylbenzene sulfonates (LAS), anionic surfanctants commonly used in laundry detergents. The no-observed-effect concentration (NOEC), as measured in life-cycle tests or estimated from embryo-larval tests, depended on the mean alkyl chain length of the LAS and was 5.1 - 8.4, 0.48, and 0.11-0.25 mg/liter for C11.2, C11.7, and C13.3 LAS, respectively. The embryo and larval stages of development were consistently the most susceptible. The concentration of methylene blue active substances (MBAS), a nonspecific measure of anionic surfactants, was determined in over 800 widely distributed United States stream samples. The mean alkyl chain length of LAS in municipal sewage treatment effluents was C11.5. On the assumption that LAS contributes approximately 50% of the stream MBAS, 96 to 100% of the stream samples contained LAS at concentrations below the measured or estimated NOEC for fathead minnows. CALCULATION OF THE TOTAL ANTHROPOGENIC LEAD IN THE SEDIMENTS OF A RURAL ONTARIO LAKE,
McGill Univ., Montreal (Quebec). Dept. of Biology.
R. D. Evans, and F. H. Rigler.
Environmental Science and Technology, Vol 14, No 2, p 216-218, February 1980. 2 Fig, 19 Ref.

Descriptors: *Lead, *Sediments, *Lake sediments, *Canada, Lakes, On-site investigations, On-site data collections, Sampling, Water pollution, Air pollution, Pollutants, Path of pollutants, Fallout, Data processing, Sedimentation, Anthropogenic lead.

Sediment cores from a rural Ontario lake (Bob Lake, latitude 44 deg 55 min N, longitude 78 deg 47 min W) were analyzed for total anthropogenic lead content. A high correlation between deposition of anthropogenic lead and sediment depth facilitated calculation of total fallout of anthropogenic lead in Bob Lake. The total fallout of 820 mg/sq m is large for a rural area in comparison to that calculated for the Lake Michigan-Chicago area (390 mg/sq m). (Sims-ISWS)

RURAL NONPOINT SOURCE WATER QUALITY IN A SOUTHEASTERN WATERSHED,
North Carolina State Univ. at Raleigh.
F. J. Humenik, L. F. Bliven, M. R. Overcash, and F. Koehler.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 29-43, January 1980. 6 Fig, 8 Tab, 13 Ref. EPA R803328.

Descriptors: *Water quality, *Water pollution, *Watersheds(Basins), *North Carolina, *Virginia, *Atlantic Coastal Plain, Flow, Streamflow, Land use, Agriculture, Forests, Pollutants, Nutrients, Runoff, Water yield, Sampling, Data processing, *Nonpoint pollution.

Grab sample data from a 2-year study of forested and agricultural piedmont and well and poorly drained coastal plain areas of the Chowan River basin, Virginia-North Carolina, were analyzed to permit better understanding of rural runoff on an areawide basis. Mean nutrient concentrations for the four area types were relatively constant, but large spatial and temporal variations occurred within each area. There were large differences between data for piedmont and data for coastal plain, but variations between forested and agricultural piedmont and between well and poorly drained coastal plain were minor. Water and nutrient yields were greatest in winter and spring. Channelization of coastal streams appeared to promote high nitrate concentrations. (Sims-ISWS)

THE TRANSPORT AND OXYGEN DEMAND OF ORGANIC CARBON RELEASED TO RUNOFF FROM CROP RESIDUES,
Science and Education Administration, Oxford, MS. Sedimentation Lab.
J. D. Schreiber, and K. C. McGregor.
Progress in Water Technology, Vol 11, No 6, p 253-261, 1979. 2 Fig, 3 Tab, 18 Ref.

Descriptors: *Agricultural runoff, *Chemical oxygen demand, *Carbon, *Farm management, Sediments, Erosion, Biochemical oxygen demand, Water quality, Runoff, Crops, Corn(Field), Soils, Nutrients, Sampling, Data processing, Regression analysis, Agriculture, Crop residues, Tillage practices.

Chemical oxygen demand (COD), total organic carbon (TOC), and the 5-day biochemical oxygen demand (BOD sub 5) concentrations and losses were determined in runoff and sediments from conventional and no-till corn grown for silage (stalks removed) and for grain (stalks chopped and left on soil surface). Higher concentrations and losses of aqueous TOC and COD from grain plots resulted from organic carbon released from crop residues. Despite a wide range of residue management, one regression equation, $Y = 1.79X - 1.89$, related annual aqueous COD concentrations, Y in mg/l, to annual aqueous TOC concentrations, X in mg/l, for the research plots and watersheds. Although sediment TOC and COD concentrations (mg/kg) from the no-till grain and silage practices were considerably larger than those from comparable conventional practices, sediment TOC and COD losses from conventional practices were 6 to 13 times greater due to larger runoff and soil losses. While the annual average BOD sub 5 values were similar for the conventional silage and no-till for grain practices, 19.6 and 19.2 mg/l, respectively, these values differed seasonally. Where applicable, no-till seems to be a best management practice for corn to minimize the oxygen demand and losses of organic carbon in runoff from croplands. (Sims-ISWS)

SOURCES OF PHOSPHORUS IN THE LOUGH NEAGH SYSTEM AND THEIR REDUCTION,
Ministry of Agriculture, Crumlin (Northern Ireland). Freshwater Biological Investigation Unit.
R. V. Smith.
Progress in Water Technology, Vol 11, No 6, p 209-217, 1979. 4 Fig, 5 Tab, 6 Ref.

Descriptors: *Phosphorus, *Lakes, *Nutrients, Runoff, Water pollution, Sewage, Sewage treatment, Rivers, Watersheds(Basins), Drainage, Pollutants, Detergents, Sediments, Water pollution control, *Lough Neagh(Ireland).

Soluble reactive phosphorus is a critical nutrient in Lough Neagh and limits production of the algae in the lough. Accurate estimates of the input of soluble reactive P to the lough loads in each of the six major rivers were obtained by statistical modeling from continuous records of flow and concentrations of P measured every 8 days. Analysis of these data indicated that there was a significant correlation between the soluble reactive P loadings and the human, but not the animal, population densities of catchments. On the basis of the regression equations, the land drainage contribution of soluble reactive P was quantified as 0.14 kg P/ha/year and the rural per capita as 1.1 g P/person/day. If sewage works to towns of populations greater than 2000 were modified to incorporate P reduction stages, then about 40% of the available P to the lough could be curtailed. The effect of a complete detergent P ban would be to lower the sewage contribution of P by 50% loading to up to 40% curtailment of the available P input to the lough. Combining a ban and P reduction at sewage works could reduce the available P input by 60%. (Sims-ISWS)

Agriculture has been identified as a potential source of water pollution as a result of: (1) the increasing intensity of many animal and crop producing operations; (2) the link that has been demonstrated between manure runoff, agricultural land runoff, and specific water pollution problems; and (3) the recognition, in certain areas, that control of municipal and industrial pollution may not be adequate to achieve desired water quality objectives. Although the relationships between animal and crop production practices, agricultural land use, and adverse impacts on water quality are largely empirical and general, there are approaches that can be used to minimize any adverse effect that agriculture might have. These approaches include runoff and erosion control practices; better timing and use of pesticides, fertilizers, and manure applications; and soil and water conservation practices. Many of these approaches are being utilized, and data on their effectiveness are available. This paper discussed both point and nonpoint potential agricultural pollutants in terms of: (1) sources, relative importance, and types of pollutants; (2) the magnitude of actual discharges; and (3) approaches and practices that can be used for the control of specific pollutants. The discharge from a drained pasture disposal site receiving milking shed wastewater was sampled intensively over several 24-hour periods. The effluent was characterized in terms of nutrients (N and P forms), oxygen demand, coliform bacteria, solids, and pH. The efficiency of the disposal area in 'filtering' the wastewater was calculated and was found to be relatively constant between runs, despite the fact that with seasonal variations in antecedent soil moisture and rainfall, there were large differences in the volume of drainage water discharged. The patterns of flow and composition of the discharge were investigated. It was concluded that it would be dangerous to sample only during or near the regular diurnal peaks in flow rate associated with the twice daily milking schedule, without further investigations of the relationship of the flow rate to the parameter concerned. It was estimated that a sampling interval of no greater than one hour was required to provide estimates of loadings which were within 10% of the true values over all runs and all parameters. Research with soil columns that are good models of a field groundwater recharge system showed that most polioviruses are held near the soil surface. Secondary sewage effluent seeded with poliovirus type 1 (LSc) was filtered through 250-cm columns packed with calcareous sand from an area in the Salt River bed that is used for groundwater recharging of secondary sewage effluent. When the concentration of poliovirus added to the sewage water was increased from 0.9 x 100 to 2.6 x 10,000 PFU/ml, the number of viruses detected at each soil depth increased with the increasing virus concentration in the sewage water. However, the percentage of added viruses that remained at each depth was about the same for each concentration. The differences in the strength of the negative charge among members of a given viral population could account for the adsorption of some viruses near the soil surface while others move farther through the profile. Increasing the flow rate from 0.6 to 1.2 m/day caused a virus breakthrough of less than 1% of the added virus. However, 99% of the viruses still were removed from the infiltrating water at flow rates as high as 12 m/day. The velocity of water movement through the soil may be the single most important factor affecting the depth of virus penetration. (Visocky-ISWS)

FEASIBILITY OF WATER QUALITY IMPROVEMENT IN THREE ILLINOIS RIVERS,
Arizona Univ., Tucson. Dept. of Landscape Architecture.
D. C. Wilkin, and R. C. Flemal.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 293-298, February 1980. 10 Tab, 4 Ref.

Descriptors: *Water pollution sources, *Water quality, *Watersheds(Basins), *Rivers, *Illinois, Land use, Water pollution control, Water quality standards, Pollutants, Path of pollutants, Nitrogen, Ammonia, Iron, Copper, Lead, Phosphorus, Coliforms, Dissolved solids, Sampling, Data processing, Nonpoint pollution sources.

Three river basins in Illinois, varying in amount of urban and industrial development, have been studied to learn where pollution loadings originate and to determine what potential exists for water quality improvement. In all basins studied and for all constituents analyzed, complete elimination of all defined contributions would not greatly improve existing residual violation rates. Currently undefined contribution in these three basins, largely nonpoint-source pollution, holds the key to any substantive improvement. (Sims-ISWS)

Several potential applications of Clostridium perfringens as a water quality indicator were examined, including its use as an indicator of recreational water quality, a conservative tracer, a monitoring agent for chlorinated drinking water, and one component of indicator systems to determine the proximity and nature of sources of fecal pollution. The data from this preliminary study indicate that, while C. perfringens is not an appropriate indicator for recreational waters, it shows promise in the remaining areas, particularly as a conservative tracer and as a monitoring device for chlorinated drinking water. THE CHEMISTRY OF THE RIVER WYE,
University of Wales. Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
A. C. Oborne, M. P. Brooker, and R. W. Edwards.
Journal of Hydrology, Vol 45, No 3/4, p 233-252, February 1980. 6 Fig, 7 Tab, 39 Ref.

Descriptors: *Rivers, *Water chemistry, *Water quality, Geologic control, River flow, Population, Land use, Spatial distribution, Runoff, Dry seasons, Wet seasons, Dissolved solids, Calcium, Magnesium, Sodium, Potassium, Bicarbonates, Silica, Nitrates, Phosphates, *Great Britain, *River Wye.

Samples collected during April 1975-December 1977 from 14 sites in the River Wye catchment were analyzed for total dissolved solids, calcium, magnesium, sodium, potassium, bicarbonate, reactive silica, nitrate, orthophosphate, suspended solids, and soluble organic carbon. The study period encompassed some of the most severe drought conditions recorded in the Wye catchment, and comparisons of the spatial and temporal variation in concentrations and mass flows of determinands were made from contrasting flow periods, September 1975-August 1976 (dry) and September 1976-August 1977 (wet), when flows in the lower Wye were 38% and 118%, respectively, of the longterm average. Spatial variations in water quality were related principally to geology (e.g., calcium) and population and land use (e.g., orthophosphate, nitrate). Significant flow-concentration relationships were established and, at all sites in both wet and dry periods, concentrations of most anions and cations were reduced by increased flow: nitrate and suspended-solids concentrations increased with increased flow. Annual subcatchment yields per unit area were substantially greater during the wet than the dry period and this was most marked in the lower catchment where differences in runoff between the two periods were greatest. Orthophosphate loads in both periods and nitrate loads in the dry period were significantly related to population density. (Visocky-ISWS)

BUFFERING OF SILICA AND PHOSPHATE IN A TURBID RIVER,
Maine Univ. at Orono, Walpole. Dept. of Oceanography.
L. M. Mayer, and S. P. Gloss.
Limnology and Oceanography, Vol 25, No 1, p 12-22, January 1980. 9 Fig, 36 Ref. NSF AEN72-03469, GI-34831.

Descriptors: *Silica, *Phosphates, *Rivers, *Turbidity, *Colorado River, Sediments, Dissolved solids, Sampling, Laboratory tests, Adsorption, Sorption, Chemistry, Water chemistry, *Buffering.

The buffering of riverine dissolved silica and phosphate by sorption reactions between the aqueous phase and suspended sediment was examined with the turbid Colorado River system as a model. Concentrations were found to lie in a range predicted from laboratory sorption experiments with natural sediments and waters. Phosphate was probably highly buffered by suspended sediment during river flow while silica was not. Silica appreciably affected phosphate sorption reactions but not vice versa. Increased temperature resulted in higher silica but lower phosphate concentrations as a result of sorption. The buffering action of suspended sediments was largely complete within a few hours and was approximately proportional to the concentration of suspended sediment. (Sims-ISWS)

The study examined the effect of agriculture relative to other land uses upon river water quality at a regional level using 49 nonpoint (diffuse) source and 52 point source drainage basins in southern Ontario, and which are tributary to Lakes Ontario, Erie, Huron, and connecting waterways. Methods of data filtering were examined, and substantive relationships among river water quality and categories of land use were identified. Water quality data were mean annual concentration for the period 1968-72 for nutrients and other physical and chemical variables. Land use variables employed a reduced set of Canada Land Inventory categories which include agricultural and urban variables. Filtering techniques included correlation, factor, and discriminant analyses. Factor analysis did not effectively group these variables. Alternatively, discriminant analysis offered a rapid and convenient method for identifying those independent variables responsible for variations in water quality. Correlation was used to examine those relationships among variables which were identified by discriminant analysis. Although urban variables appear to be responsible for extremely high levels of total nitrogen, and total and soluble phosphorus found in a few basins, cropland appears to influence levels of those attributes in basins representing the top one-third of ranked mean annual values. Cropland is the single discriminating variable for basins having large suspended sediment concentrations and is strongly related to nitrate levels. (Sims-ISWS)

This paper showed that nitrate-nitrogen was naturally removed from the waters of a small stream, at a rate which can greatly affect estimates of the yield of nitrogen from the catchment. Four different methods were used to estimate the rate of nitrate-N removal, values for which were in the range of 0.2 to 0.9 g/sq m/day. These were similar to values found in other places where bacterial denitrification appeared to cause nitrate removal, but no conclusion can be drawn from this work about nitrate removal mechanisms acting in the catchment studied. These values, when interpreted with the aid of a simple mathematical model, suggested that it is likely that nitrate removal will be important in any comparison of catchments where the flow rate divided by streambed area in the first order tributaries is less than 5.9 cu m/sec/sq km. NUTRIENT CONCENTRATIONS IN RUN-OFF FROM A GLEY PODZOL SOIL,
Canterbury University, Christchurch (New Zealand). Dept. of Chemistry.
H. K. J. Powell, and M. C. Taylor.
Progress in Water Technology, Vol 11, No 6, p 295-301, 1979. 3 Fig, 10 Ref.

Descriptors: *Nutrients, *Runoff, *Pastures, *Nutrient removal, Agricultural runoff, Fertilizers, Phosphorus, Potassium, Sulfur, Calcium, Sampling, Chemical analysis, Water chemistry, Agriculture, *New Zealand.

Loss of nutrient in 'surface' runoff was studied for a pasture developed on a gley podzol soil under 2700 mm precipitation. The concentration of nutrients in runoff peaked significantly in the 3 months following fertilizer application (450 kg/ha of 30% potassic superphosphate), the relative concentrations being calcium greater than potassium greater than sulfur much greater than phosphorus. The mobility of nutrient in runoff was discussed in relation to the chemical properties of the soil and the levels of essential nutrients observed in pasture grass and clover. By ignoring base levels of nutrient arising from previous applications and from soil weathering, and assuming 0.8 for the fraction of precipitation appearing as 'surface' runoff, the estimated mass of nutrient lost (within 3-5 months of fertilizer application) was equivalent to 28% of potassium applied, 37% of sulfur, 40% of calcium, and 6% of phosphorus. (Sims-ISWS)

LOSSES OF PHOSPHORUS AND NITROGEN FORMS IN SUBSURFACE DRAINAGE WATER AS INFLUENCED BY PHOSPHATE FERTILIZER, GRAZING ANIMALS, AND IRRIGATION TREATMENTS,
Massey Univ., Palmerston North (New Zealand). Dept. of Soil Science.
M. A. Turner, R. W. Tillman, and J. K. Syers.
Progress in Water Technology, Vol 11, No 6, p 287-294, 1979. 1 Fig, 3 Tab, 13 Ref.

Descriptors: *Nutrient removal, *Nitrogen, *Phosphorus, *Water quality, Agricultural runoff, Drainage, Tile drainage, Fertilizers, Grazing, Irrigation, Effects, Agriculture, *New Zealand.

The effects of phosphate (P) fertilizer, grazing animals, and irrigation treatments on losses of phosphorus (P) and nitrogen (N) forms in subsurface mole and tile drainage waters were investigated, under field conditions. Total P (TP) and total N (TN) losses ranged from 0.5-2.1 kg/ha and 7-43 kg/ha, respectively. For both P and N, most of the losses occurred as dissolved forms. Losses of dissolved inorganic P (DIP), total dissolved P (TDP), and TP were highest when all three treatments occurred together, intermediate with combinations of any two treatments, and lowest when only one treatment was present. For all comparisons, P fertilizer increased the losses of DIP, with the greatest increase being equivalent to approximately 1.8% of the P added. Losses of nitrate N (N03-N) and the percentage contribution of N03-N to total dissolved N (TDN) were highest with the grazing treatment. Grazing and irrigation treatments, and especially the interaction between the two, were important factors determining the magnitude of N03-N losses. (Sims-ISWS)

FACTORS AFFECTING DOWNSLOPE MOVEMENT OF NUTRIENTS IN HILL PASTURE,
Department of Scientific and Industrial Reseach, Lower Hutt (New Zealand). Soil Bureau.
R. H. S. McColl.
Progress in Water Technology, Vol 11, No 6, p 271-285, 1979. 3 Fig, 6 Tab, 17 Ref.

Descriptors: *Runoff, *Pastures, *Nutrients, *Overland flow, Agricultural runoff, Sampling, Rainfall, Organic matter, Dissolved solids, Nitrogen compounds, Nitrates, Phosphorus, Calcium, Magnesium, Sodium, Potassium, Fertilizers, Grazing, Sheep, Pollutants, Path of pollutants, Agriculture, *New Zealand.

Surface water was collected over 1 year during a study of the effects of season, sheep grazing, and fertilizer on downslope movement of nitrate, Kjeldahl nitrogen, phosphorus, calcium, magnesium, sodium, potassium, total solids, and organic matter in hill pasture, Taita, New Zealand. Nutrients moved short distances downslope in most rain events greater than 5 mm but long distances in three overland flow events during winter, which accounted for 75% of the year's water runoff. Estimates of the year's downslope movement showed that overland flow events accounted for about 60-80% of the nitrate, calcium, magnesium, sodium, total solids, and organic matter, and about 30-50% of the Kjeldahl nitrogen, total phosphorus, and potassium. About 45% of the Kjeldahl nitrogen and about 30% of the potassium moved downslope in events following within 5 days of grazing. About 34% of the total phosphorus movement occurred in two rain events following superphosphate application to recently grazed pasture; only 0.2% of the year's total moved in topdressed pasture with long grass. Estimated annual losses in surface water runoff (which was less than 1.2% of rainfall) from the experimental area were Kjeldahl nitrogen 0.59 kg/ha, nitrate nitrogen 0.23 kg/ha, and total phosphorus 0.11 kg/ha. These amounts of loss were less than atmospheric inputs. With the exception of rare overland flow events, the area studied did not contribute nutrients directly to streamflow as surface runoff from individual rain events and downslope movement was probably insignificant agriculturally. (Sims-ISWS)

EFFECTS OF RURAL AND URBAN SOURCES OF PHOSPHORUS OF LAKE BURLEY GRIFFIN,
Canberra Coll. of Advanced Education (Australia). School of Applied Science.
P. Cullen, and R. S. Rosich.
Progress in Water Technology, Vol 11, No 6, p 219-230, 1979. 6 Tab, 19 Ref.

Descriptors: *Phosphorus, *Lakes, *Sewage effluents, *Runoff, *Australia, Urban runoff, Agricultural runoff, Storm runoff, Monitoring, Sampling, Water pollution, Water pollution sources, Sediments, Eutrophication, Algae, Chlorophyll, Aquatic productivity, Nonpoint sources.

Lake Burley Griffin is a small (704 ha) artificial lake in the center of Canberra, Australia. Weekly monitoring of various forms of phosphorus to the lake over an 18-month period has enabled estimates to be made of phosphorus inputs and outputs from the lake. Flood events were shown to contribute 69% of the phosphorus, although these occupied only 9% of the study period. Of this flood phosphorus, 90% came from rural lands. Some 40% of the inflowing phosphorus was retained by the lake, mainly due to sedimentation. The application of the Vollenweider loading approach to the lake was discussed and compared to actual phosphorus concentration and biological production. (Sims-ISWS)

SPRAY IRRIGATION OF DAIRY FACTORY WASTEWATER ONTO PASTURE--A CASE STUDY,
Massey Univ., Palmerston North (New Zealand). Dept. of Soil Science.
K. W. McAuliffe, K. D. Earl, and A. N. Macgregor.
Progress in Water Technology, Vol 11, No 6, p 33-43, 1979. 3 Fig, 3 Tab, 15 Ref.

Descriptors: *Waste water disposal, *Dairy industry, *Irrigation, *Pastures, Spraying, Effluents, Waste disposal, Nutrients, Phosphorus, Nitrogen, Soil water, Groundwater, Infiltration, Water table, Fertilizers, Dissolved solids, Suspended solids, Pollutant identification, Farm management, Soil science, Casein wastewater.

Analyses were made of soil, soil water, and groundwater parameters at a pasture disposal site which had received casein wastewater for approximately 15 years. Effluent composition analyses suggest that large quantities of nutrients, such as nitrogen and phosphorus, have been applied to the site. Marked increases in both the inorganic and organic fractions of these nutrients in the soil have occurred. Associated with the chemical property alternations are a number of physical and biological changes, such as lower bulk density, higher levels of soil respiration, and increased earthworm numbers. Soil water analyses indicated that large quantities of nitrogen and phosphorus may be leached to the groundwater although groundwater samples remained constantly low in N03-N and DIP levels, suggesting that any percolating nutrients are diluted by the rapidly flowing groundwater. The implications of wastewater disposal on farm management practices were also discussed. (Sims-ISWS)

QUALITY OF DRAINAGE WATER FROM PASTURE TREATED WITH DAIRY SHED EFFLUENT,

Massey Univ., Palmerston North (New Zealand). Dept. of Soil Science.
A. N. Macgregor, J. D. Stout, and R. J. Jackson.
Progress in Water Technology, Vol 11, No 6, p 11-17, 1979. 1 Fig, 7 Tab, 9 Ref.

Descriptors: *Waste water disposal, *Dairy industry, *Effluents, *Irrigation, Drainage, Pastures, Pollutants, Path of pollutants, Pollutant identification, Nitrogen, Phosphorus, Bacteria, Coliforms, Soil water, Farm wastes, Nutrients, Nutrient removal, Waste disposal, Land management.

Dairy shed effluent was sprinkler irrigated onto intensively drained permanent pasture. Subsurface drainage water from the pasture disposal site was examined for the forms and amounts of nitrogen and phosphorus and the numbers of fecal coliform bacteria present. Although soil conditions that permitted rapid movement of waste components into the subsurface drainage prevailed at times, it was estimated that not less than 90% of the N and 98% of the P were removed by passage through the pasture-soil system. Descriptors: *Plant pathology, Pathogenic bacteria, Pathogenic fungi, *Plant diseases, Phytoplankton, Macrophytes, Plant groupings, *Aquatic weed control, Biocontrol, Eurasian water milfoil, Wisconsin, Lake Mendota(WI), Dane County(WI).

Field and laboratory observations were made during 1978 and 1979 on species composition and pathology of the phytoplankton and macrophyte communities in University Bay, Lake Mendota, Wisconsin. No evidence was found that pathogens play a significant role in the regulation of seasonal periodicity of phytoplankters or in inter-algal species competition. There was a pronounced general decline in macrophytes between 1978 and 1979 which may have been due to turbidity of the water. Disease appeared to be endemic rather than epidemic in the macrophyte community. All symptoms observed were in the atrophic or necrotic categories. Signs of disease were never apparent. Presumptive pathogens included fungi and bacteria obtained as singular and consistent isolates from surface-sterilized stem or leaf lesions. Demonstration of causality of fulfillment of Koch's Postulates was completed for Fusarium sporotrichioides, which causes stem lesions and apical chlorosis on Eurasian watermilfoil (Myriophyllum spicatum L.). Other presumed pathogens were isolated from milfoil following reinoculation, but did not induce characteristic symptom development. A fungus, identified tentatively as Trichothecium, grew endophytically in Eurasian milfoil and was associated with decline of the plant. Endophytic microorganisms appeared to be common in macrophytes and may offer the best prospect for biological suppression, or as the biological component of an integrated strategy for the control of nuisance aquatic macrophytes.

DISSOLVED OXYGEN IMPACT FROM URBAN STORM RUNOFF,
Sutron Corp., Arlington, VA.
T. N. Keefer, R. K. Simons, and R. S. McQuivey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-138266, Price codes: A11 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-156, November 1979. 248 p, 11 Fig, 18 Tab, 11 Ref, 4 Append. 68-03-2630.

Descriptors: *Dissolved oxygen, *Urban runoff, *Storm runoff, *Surface runoff, *Water pollution sources, Combined sewers, Water quality, Monitoring, Rainfall, Gaging stations, Streamflow, Correlation analysis.

Data from 104 water quality monitoring sites in and downstream of urban areas were evaluated to determine the correlation and the magnitude of the correlation between storm runoff and dissolved oxygen deficits downstream of urban areas. Of the 104 stations only 83 had sufficient data to produce results: 55 U.S. Geological Survey monitors, 17 STORET system monitors, and 11 Wisconsin Department of Natural Resources monitors. Forty-two percent of the monitors examined showed a 60% or more probability of a higher than average dissolved oxygen deficit for times of high stream flow or rainfall. This 60% probability was not found for all years at any given station but a frequency of 3 years in 5 was typical. At 22 of the monitor sites detailed hourly analysis show a diurnal cycle for dissolved oxygen concentrations. This cycle disappears during a storm event as flow increases and dissolved oxygen concentrations fall 1 to 1.5 mg/l below the minimum of the normal diurnal cycle low for one to five days. Dissolved oxygen levels of less than 5.0 mg/l were used as a standard for the study. Overall the probability is one in three that analysis of data from the monitors near urban areas will show a correlation between high flow and/or rainfall events and high dissolved oxygen deficits. The data base used for the correlation is not geographically homogeneous so no national conclusions can be drawn. (Seigler-IPA)

VERIFICATION OF THE WATER QUALITY IMPACTS OF COMBINED SEWER OVERFLOW,
Rexnord Inc., Milwaukee, WI. Environmental Research Center.
T. L. Meinholz, W. A. Kreutzberger, M. E. Harper, and K. J. Fay.
Environmental Protection Technology Series Report No EPA-600/2-79-155, December 1979. 200 p, 68 Fig, 29 Tab, 33 Ref, 2 Append. R-804518.

Descriptors: *Milwaukee River, *Combined sewers, *Dissolved oxygen, *Mathematical models, Water pollution sources, Coliforms, Urban runoff, Bottom sediments, Suspended solids, Oxygen demand, Water quality, Dredging, Regression analysis, Flow rates.

Water quality impacts in the Milwaukee River in terms of dissolved oxygen (DO) and fecal coliform concentrations following wet weather discharges were studied and modeled with a modified Harper's water quality model. Intensive field surveys and river dye studies show that river velocity is extremely slow in the lower reach near Lake Michigan even during high flow periods. Due to this slowness sediments accumulate in the lower river forming a significant sink for DO. Oxygen demand for these sediments when disturbed can be as high as 1000 gm/sqm-day or more than 100 times greater than the demand for undisturbed sediments. A rapid decline in DO is often observed following combined sewer overflows (CSO) that cannot be entirely attributed to the loadings from the CSO. The rapid DO decline is linked to the scouring of sediment oxygen demand by submerged CSO outfalls. Using regression analysis empirical equations were developed to predict CSO sediment scouring impacts on DO. Harper's water quality model was modified, calibrated, and verified for the simulation of fecal coliform and DO river conditions with various dry, wet, and CSO events. It is recommended that the feasibility of a periodic dredging program for the river be examined as a means of alleviating the DO problems. (Seigler-IPA)

METHANE ADDITION TO AN ARCTIC LAKE IN WINTER,
Department of Fisheries and Oceans, Winnipeg (Manitoba). Freshwater Inst.
H. E. Welch, J. W. M. Rudd, and D. W. Schindler.
Limnology and Oceanography, Vol 25, No 1, p 100-113, January 1980. 12 Fig, 5 Tab, 20 Ref.

Descriptors: *Methane, *Lakes, *Winter, *Arctic, Effects, Dissolved oxygen, On-site investigations, Ice cover, Hydrogen ion concentration, Alkalinity, Carbon, Electrical conductance, Nitrogen, Phosphorus, Silica, Chlorides, Water chemistry, Pollutants, Water pollution, Path of pollutants.

The possible use of buried pipelines to transport natural gas (about 99% methane) through the Canadian arctic prompted a study of some of the dynamics of methane metabolism in an arctic lake at 63 deg 38 min N Lat. The two basins of the lake were separated during winter 1977-1978 by a curtain, and 300 kg of methane was dissolved into one side, to a maximum of 120 micro M/liter or 0.7 M/sq m. Oxidation occurred throughout the water column, but the highest rates were at or near the sediment surface. High phosphate and nitrate additions did not stimulate oxidation. The sediments generated methane naturally, and winter concentrations in undisturbed lakes were 0.2-1.0 micro M/liter. The added methane disappeared at a slow, steady rate of 1.89 mM/sq m/d or 0.32 micro M/liter/d from February to June. The oxygen depletion rate of the entire experimental basin was 0.244 g/sq m/d, compared with 0.210 in the control basin, and was not measurably affected by artificially added methane; a winter pipeline rupture would therefore probably not result in severe oxygen depletion in downstream lakes. These and other results were not expected based upon knowledge of methane dynamics in temperate lakes. (Sims-ISWS)

LOSS OF FLUOMETURON IN RUNOFF WATER,
Texas Agricultural Experiment Station, Bushland.
A. F. Wiese, K. E. Savage, J. M. Chandler, L. C. Liu, and L. S. Jeffery.
Journal of Environmental Quality, Vol 9, No 1, p 1-5, January-March 1980. 2 Fig, 5 Tab, 29 Ref.

Descriptors: *Pesticides, *Herbicides, *Runoff, *Water pollution sources, Sampling, On-site investigations, On-site data collections, Chemical analysis, Agricultural runoff, Pollutants, Path of pollutants, Pollutant identification, Agriculture, *Fluometuron.

The amount of fluometuron in runoff water under different environmental conditions was determined in the southern U.S. and Puerto Rico. In Mississippi, Puerto Rico, and Texas, runoff water was collected from soil sprayed with 4.4 kg/ha of fluometuron each year for 3 years. Tests were conducted in Tennessee for 2 years and in North and South Carolina for 1 year. Water samples were collected in 4- by 10-m plots, and 1 m downslope. Initial runoff was produced with sprinkler irrigation immediately after herbicide application at all locations except Tennessee and South Carolina which relied on rainfall. Later in the season, water was sampled from two additional runoff events of either irrigation or rainfall. A total of 32 runoff events were sampled at the 6 locations. The level of fluometuron in water caught 1 m downslope from treated areas during the first runoff averaged 0.30 ppm and was highest (0.87 ppm) in Puerto Rico. Fluometuron concentration in subsequent events was much lower than in the first runoff events. Average loss of fluometuron in 1 cm of runoff was less than 1% of applied fluometuron. Only 2% of applied fluometuron was lost in the situation producing the highest concentration in runoff water. Level of fluometuron in runoff water was directly related to slope. Results of this study indicated that fluometuron concentrations in runoff from treated fields are such that nontarget species should not be adversely affected. (Sims-ISWS)

DESIGN CRITERIA FOR COOLING-WATER OUTLET STRUCTURES,
Karlsruhe Univ., (Germany, F.R.).
M. Schatzmann, and E. Naudascher.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY3, Proceedings Paper 15239, p 397-408, March 1980. 8 Fig, 1 Tab, 10 Ref.

Descriptors: *Cooling water, *Dispersion, *Rivers, *Model studies, Mathematical models, Hydraulic models, Outlet works, Water pollution, Thermal pollution, Effluents, Design, Environmental engineering.

This paper described some laboratory studies utilizing buoyant and nonbuoyant tracers to investigate the effects of the initial conditions on the lateral mixing of cooling water or wastewater discharge into rivers. The paper began with a short phenomenological description of the dispersion of cooling-water side discharges into rivers from which a concept for quantifying the effect of the outfall parameters on the near-field mixing is then deduced. By means of a virtual-source concept and two bulk parameters describing the stability of the near-field density stratification and the strength of an assumed reference source, the results can be presented in a straightforward graphical form. These graphs provide a first estimate of design criteria for an outlet structure which is to be designed to maximize the rate of near-field mixing for a given cooling-water discharge. (Sims-ISWS)

EFFECTIVENESS OF SUBMERSED ANGIOSPERM-EPIPHYTE COMPLEXES ON EXCHANGE OF NUTRIENTS AND ORGANIC CARBON IN LITTORAL SYSTEMS. III. REFRACTORY ORGANIC CARBON,
Michigan State Univ., Hickory Corners. W.K. Kellogg Biological Station.
A. M. Mickle, and R. G. Wetzel.
Aquatic Botany, Vol 6, No 4, p 339-355, August 1979. 9 Fig, 25 Ref. NSF BMS-75-20322, DEB-75-203220A01, DOE EY-76-S-02-1599, COO-1599-142.

Descriptors: *Macrophytes, *Organic compounds, *Littoral, *Fulvic acids, *Nutrient removal, Scirpus, Myriophyllum, Pollution abatement, Plant physiology, Seasonal, Metabolism, Epiphytes, Organic matter, Organic loading, Biochemistry, Allochthonous material, Filters, Organic acids.

Submersed macrophyte-epiphyte complexes possess physical and metabolic mechanisms which substantially reduce the quantity and quality of allochthonous refractory organic compounds entering a lake. While some of these compounds entering a lake littoral zone pass through unchanged, a large portion interacts with the macrophyte-epiphyte complex. Experiment results suggest that macrophyte-epiphyte complexes are effective in removing refractory organic compounds; however, this effectiveness varies with season and species. Experimental design is comprised of two continuously flowing systems: System I contains a natural Scirpus subterminalis population and System II contains Myriophyllum heterophyllum. Epiphytes are left intact. Refractory dissolved organic compounds, consisting mainly of fulvic acids labelled with C14, are added to inflow water. DOC concentrations in outflow waters from littoral complexes of both experimental systems are higher than those from control (no plant) complexes. This increase is evident in DOC of compounds $>$ 1000 Daltons in System II; in System I, this increase occurs in DOC $>$ 10,000, but mainly in compounds $>$ 30,000 Daltons. Outflow waters from experimental littoral complexes show a substantial decrease in calcium concentration. This reduction is caused by CaCO3 precipitation induced by photosynthesis. UV absorption and flourescence are higher in littoral complex outflow waters than in control outflow waters. The difference is much greater in System I than System II; this results from continual senescence by the perennial Scirpus species. (Danovich-Wisconsin)

QUALITY OF SURFACE WATER ON SANIBEL ISLAND, FLORIDA, 1976-77,
Geological Survey, Tallahassee, FL. Water Resources Div.
B. F. McPherson, and T. H. O'Donnell.
Available from: OFSS/USGS Box 25425, Fed. Ctr. Denver, CO, Paper copy $7.25 Microfiche $3.50. Geological Survey open-file report 79-1478, 1979. 50 p, 14 Fig, 12 Tab, 6 Ref.

Descriptors: *Water quality, *Surface waters, *Florida, *Surface-groundwater relationships, *Pollutants, Water pollution sources, Saline water intrusion, Artesian aquifers, Sampling, Sites, Water resources, Hydrologic data, *Sanibel Island(Fla).

The quality of surface water in parts of the interior of Sanibel Island, Fla., has been periodically degraded by high concentrations of salt or macronutrients and by low concentrations of dissolved oxygen. In 1976 the chloride concentration of surface water ranged from about 500 milligrams per liter to almost that of seawater, 19,000 milligrams per liter. The highest salinities were during the dry season of 1976 in the Sanibel River near the Tarpon Bay control structure and are attributed to leakage of saline water past the structure. The highest concentrations of macronutrients occurred during the dry season in the eastern reach of the Sanibel River, where concentrations generally exceeded 4.0 milligrams per liter total nitrogen and 0.9 milligrams per liter total phosphorus. Concentrations of dissolved oxygen were lowest in the wet season along an eastern reach of the Sanibel River and in several nearby ponds and canals where near-anaerobic conditions prevailed. The high concentration of macronutrients and the low dissolved oxygen are attributed, in part, to urban and sewage effluent that flow directly or seep into surface water. (Kosco-USGS)

GROUND-WATER QUALITY IN THE UPPER SANTA ANA RIVER BASIN, SOUTHERN CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
L. A. Eccles.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-161888, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-113, December 1979. 51 p, 15 Fig, 2 Tab, 11 Ref.

Descriptors: *Groundwater, *Water quality, California, *Water pollution sources, *Nitrates, Dissolved solids, Model studies, Water wells, Sampling, Monitoring, Networks, Chemical analysis, *Upper Santa Ana River basin(Calif).

The principal ground-water quality problems in the Santa Ana River basin, as determined from two samplings (1968-69 and 1977-78), are high concentrations of dissolved solids in general and nitrate-nitrogen in particular. The distribution of dissolved solids exceeding 800 milligrams per liter was smaller in area in 1977-78 than in 1968-69. Distribution of nitrate-nitrogen exceeding 10 milligrams per liter was larger in area in 1977-78 than in 1968-69. Concentrations of dissolved solids and nitrate-nitrogen decreased with depth. The network of wells used in the 1977-78 sampling program provides only a general appraisal of overall quality for most of the upper Santa Ana River basin. It is not adequate for detailed appraisals of specific problem areas because it lacks sufficient areal coverage and construction information for the wells sampled. (Kosco-USGS)

RESPONSE OF THE TENCH (TINCA TINCA L.) TO POTASSIUM NITRATE ENRICHED WATER,
Lyon-1 Univ., Villeurbanne (France). Lab. de Physiologie Generale et Comparee.
A. Demael, D. Garin, and G. Peres.
Journal of Fish Biology, Vol 16, p 15-22, 1980. 7 Tab, 22 Ref.

Descriptors: *Fish physiology, *Toxicity, *Potassium, Animal metabolism, Membrane processes, Osmosis, Ions, Water chemistry, Chemical reactions, Biochemistry, Sodium, Electrolytes, Freshwater fish, Potassium nitrate, *Tench, *Tinca, *Osmoregulation, *Blood chemistry, *Tissue analysis.

When the tench (Tinca tinca L.) was exposed to a slight increase, 8.5 mg/l, in the potassium content of the water, metabolic and hormonal changes occurred which lasted more than four weeks. An initial phase of lipolysis was followed by a partial consumption of glycogen reserves, which in turn was followed by a phase of gluconeogenesis. Hyperglycaemia persisted throughout the experiment. The ion distribution in erythrocytes and liver changed relatively early; there was no observable change in water content. These changes are similar to those observed during the osmoregulation of fish. (Deal-EIS)

BIOACCUMULATION AND BIOAMPLIFICATION OF MERCURY COMPOUNDS IN A THIRD LEVEL CONSUMER, SALMO GAIRDNERI, INFLUENCE OF THE TEMPERATURE FACTOR (IN FRENCH),
Bordeaux-1 Univ., Talence (France). Lab. d'Ecologie Animale.
A. Boudou, F. Ribeyre, A. Delarche, and R. Marty.
Water Research, Vol 14, p 61-65, 1980. 6 Fig, 8 Ref, (English abstract).

Descriptors: *Mercury, *Food chains, *Path of pollutants, Heavy metals, Trophic level, Rainbow trout, Chlorella, Chlorophyta, Daphnia, Livebearers, Mortality, Bioassay, Water chemistry,

Water temperature, *Bioaccumulation, *Bioamplification, *Tissue analysis.

The bioaccumulation and bioamplification of mercury compounds in a third level consumer, Salmo gairdneri have been quantified. The direct contamination is analysed by mortality tests and by metal dosing both in fish and in their principal organs. This study was made with regard to the chemical form of the pollutant (HgCl2 and CH3HgCl), the dose introduced in the environment, the length of contamination, and the temperature. An interspecific comparison of the direct toxicity is made with Carrassius carrassius. The global contamination (water and food) was quantified using an experimental trophic chain of four levels: Chlorella vulgaris, Daphnia magna, Gambusia affinis and Salmo gairdneri. The methyl-mercury concentration in the water was 1 ppb, the water temperature was 10, 18 and 26C and the length of contamination was 10 and 30 days. The mercury bioaccumulation, expressed by means of concentration factors with regard to the contaminant dose in the water, is strongly influenced by the temperature: 2500 at 10C, 5900 at 18C and 3100 at 26C. Our results show the clear preponderance of the trophic contamination with regards to the direct contamination. (Deal-EIS)

PESTICIDE RESIDUES IN LAKE BALATON,
Heavy Chemical Industry, Veszprem (Hungary). Research Inst.
G. Y. Pfeifer, J. E. Ponyi, and Z. Nagy.
Symposia Biologica Hungarica, Vol 19, p 21-26, 1979. 2 Fig, 4 Tab, 5 Ref.

Descriptors: *Pesticide residues, *Lakes, DDT, Chlorinated hydrocarbon pesticides, 2,4-D, DDE, Herbicides, Chemical analysis, Water chemistry, Plankton, Mussels, Carp, Organophosphorus pesticides, Gas chromatography, *BHC, *Lindane, *Bream, *Abramis, *Tissue analysis, *Bioaccumulation.

No residues of chlorinated hydrocarbons, e.g. DDT and metabolites and BHC isomers, have lately been found in samples of water, plankton, mussel and fish (bream, Abramis brama L. and carp, Cyprinus carpio L.) from Lake Balaton. In the liver and fat of pikeperach (Stizostedion lucioperca L.) lindane has been found (10-30 ppb) but this value is not statistically significant because of the limited number of samples. The lake seems to be free of chlorinated insecticide residues due to the total ban of DDT and other chlorinated type insecticides in 1970. A residue of 2,4-D has been found in the water samples collected from the lake. (Deal-EIS)

COPPER-THE MAJOR METAL COMPONENT OF GLYCERID POLYCHAETE JAWS,
Marine Biological Association of the United Kingdom, Plymouth (England). Plymouth Lab.
P. E. Gibbs, and G. W. Bryan.
Journal of the Marine Biological Association of the United Kingdom, Vol 60, p 205-214, 1980. 1 Fig, 6 Tab, 17 Ref.

Descriptors: *Copper, *Polychaetes, *Zinc, Calcium, Magnesium, *Iron, Sulfur, Chlroine, Manganese, Metals, Chemical analysis, Spectrophotometry, Animal physiology, Animal metabolism, *Tissue analysis, *Bioaccumulation, Glycera.

Analyses of the jaws of the glycerid polychaete Glycera gigantea show that copper is the principal metal component, accounting for about 1.5% of the dry weight and representing up to 67% of the total body burden of copper. The copper is concentrated in the distal tip of the jaw where the concentration is as high as 13%. Other metals in the jaws include zinc, calcium and magnesium which together account for about a further 1% of the dry weight; the iron content is low. Sulphur and chlorine are also present in appreciable quantities. A high copper level is also present in the jaws of G. convoluta, G. lapidum and G. rouxi. Although the copper concentration in the body of G. convoluta may be markedly increased at contaminated sites, the copper concentration in the jaws does not appear to be influenced by the environmental level; evidently a high copper level is a structural feature of the glycerid jaw. Zinc levels in both jaws and bodies remain fairly constant despite wide environmental variations. (Deal-EIS)

Marine Pollution Bulletin, Vol 11, p 15-18, 1980. 2 Fig, 2 Tab, 20 Ref.

Descriptors: *Pesticide residues, *Water birds, *Chlorinated hydrocarbon pesticides, *Migratory birds, DDT, Polychlorinated biphenyls, Chemical wastes, Industrial wastes, DDD, DDE, Chemical analysis, Gas chromatography, *HCB, *Tissue analysis, *Bioaccumulation.

Chlorinated hydrocarbons in industrial and agricultural use are found at significant concentrations in coastal regions. This paper reveals concentrations of HCB, DDT and PCB in tissues of the fish-eating birds staying at their winter quarters in the South Baltic. The species analyzed were: Great Crested Grebe (Podiceps cristatus); Slavonian Grebe (Podiceps auritus); Black Guillemot (Cephus grylle); Goosander (Mergus merganser); and, Black-Throated Diver (Garia arctica). The results were compared to other studies on these species. (Deal-EIS)

AVAILABILITY TO SCENEDESMUS QUADRICAUDA OF DIFFERENT FORMS OF PHOSPHORUS IN SEDIMENTARY MATERIALS FROM THE GREAT LAKES,
Canada Centre for Inland Waters, Burlington (Ontario).
J. D. H. Williams, H. Shear, and R. L. Thomas.
Limnology and Oceanography, Vol 25, No 1, p 1-11, January 1980. 2 Fig, 4 Tab, 38 Ref.

Descriptors: *Sediments, *Phosphorus, *Algae, *Lake sediments, *Great Lakes, Suspended solids, Erosion, Bank erosion, Sampling, Laboratory tests, Nutrients, Pollutants, Water pollution, Water pollution effects, Lakes, Limnology.

Sedimentary materials from eroding bluffs, suspended solids in streams, and lake bottom sediments from Lakes Ontario and Erie were cultured with the alga Scenedesmus quadricauda (Turp.) de Brebisson in modified Rodhe's medium with the sediments as the sole source of P. P uptake by the algae was related to the amount of nonapatite inorganic phosphorus in the sediments. Apatite phosphorus was not used, and the bluff samples, in which over 90% of total P was in this form, did not support algal growth. The nonapatite inorganic P fraction was highly correlated with the amounts of inorganic phosphorus extracted by three standard techniques for estimating 'available P' (extraction by NaOH and nitrilotriacetic acid solutions and by H-resin), and cell uptake equaled NaOH-extractable inorganic P in several instances. Uptake of P by the cells varied from 8 to 50% of total P and from 38 to 83% of nonapatite inorganic P when measured directly. Organic phosphorus in the sediments was not utilized by the algae. Percentage utilization of total P was in general highest when total P concentration in the sediments was itself high. (Sims-ISWS)

DISTRIBUTION, FLUXES AND BIOLOGICAL UTILIZATION OF INORGANIC NITROGEN DURING A SPRING BLOOM IN THE NEW YORK BIGHT,
Brookhaven National Lab., Upton, NY. Dept. of Energy and Environment.
H. L. Conway, and T. E. Whitledge.
Journal of Marine Research, Vol 37, No 4, p 657-668, November 1979. 4 Fig, 2 Tab, 30 Ref. DOE EY-76-C-02-0016.

Descriptors: *Ammonia, *Nitrates, *Phytoplankton, *New York Bight, *Nitrogen cycle, *Cycling nutrients, Nitrogen, Distribution, Kinetics, Nutrient requirements, Zooplankton, Continental shelf, Ceratium, Biochemistry, Euphotic zone, Light intensity, Physical properties, Bacteria, Pelagic zone, Copepods, Biomass.

Biological processes were important in rapid ammonia regeneration and recycling in the euphotic zone during a Ceratium tripos bloom in the New York Bight, April-May 1976. Inshore phytoplankton communities, typically located at depths > 25 m, are characterized by ammonia (NH4) and nitrate (N03) uptake rates that are less light-dependent than those of more uniformly distributed communities at the shelf break. Ammonia utilization, as a percentage of NH4 plus N03 utilization, yields values of 59% inshore and 70% at the shelf break. Inshore zooplankton have a 1.0 g/sq m mean dry weight whereas near the shelf break copepods have a 7.6 g dwt/sq m mean biomass. Greater zooplankton biomass at the shelf break compared to inshore regions corresponds to increased NH4 utilization by phytoplankton. Estimated NH4 re-

generation rates of inshore and shelf break zooplankton are 0.6 and 6.4 mmol N/sq m d, respectively. Observed NH4 utilization rates are 7.7 inshore and 10.3 mmol N/sq m d at the shelf break. In inshore water, benthic regeneration provides an additional 1.6 mmol N/sq m d and bacterioplankton, 0.65-1.85 mmol N/sq m d. Combined inshore NH4 input provides 38-53% of phytoplankton utilization potential whereas shelf break zooplankton NH4 input alone provides 62% daily regenerated production. Surface ambient NH4 and N03 concentrations are 0.4 and 0.1 micro mol/l, respectively; however, at 25-50 m depths concentrations are 2 and 4 micro mol/l, respectively. The New York Bight is bounded by Long Island on the north, New Jersey on the west and the 100 fathom contour line seaward. (Danovich-Wisconsin)

INFLUENCE OF AMAZON RIVER DISCHARGE ON THE MARINE PRODUCTION SYSTEM OFF BARBADOS, WEST INDIES,
Bellairs Research Inst., St. James (Barbados).
R. Kidd, and F. Sander.
Journal of Marine Research, Vol 37, No 4, p 669-681, November 1979. 1 Fig, 3 Tab, 57 Ref.

Descriptors: *Salinity, *Barbados, West Indies, *Amazon River, *Primary productivity, *Marine microorganisms, Nutrients, Water chemistry, Plankton, Hydrography, Tropical regions, Zooplankton, Speciation, Seasonal, Diatoms, Nutrient transport, Currents(Water), Precipitation(Atmospheric), Discharge(Water), Copepods, Runoff.

Hydrographic, biochemical and biological evidence show that Amazon River discharge has a profound effect on primary production off Barbados, West Indies, monitored February 1975-March 1976. Lower salinities, 33.4 ppt as opposed to 35.4 ppt (winter), traditionally experienced every summer at Barbados is attributed chiefly to increased seasonal precipitation and subsequent increased runoff in the Amazon region. In the tropical Caribbean marine environment, production is restricted by lack of essential nutrients. Phosphate concentrations are statistically higher during summer (0.060 micro g-A/l) than winter (0.043 micro g-A/l). Phytoplankton counts clearly indicate higher average plant populations during summer than winter. Diatoms account for a larger percentage of phytoplankton during summer (79.60%) than winter (54.65%). Mean zooplankton dry weight and numbers are significantly higher in summer than in winter. Twenty copepod species previously unknown to Barbadian waters were recorded; 13 of these occurred in winter and only seven during summer. Lower diversity and sominance are associated with summer Amazon River 'freshened' waters in the region. Conversely, higher diversity and dominance are associated with winter, when Amazon River influence is minimal. Lower salinity waters, associated with maximum Amazon River discharge, increase physiological stress to the otherwise biologically-accommodated stenotopic regional fauna. This favors eurytopic pelagic fauna, reducing species diversity and giving rise to lower dominance diversity. (Danovich-Wisconsin)
W80-04275

CHANGES IN PHOSPHORUS CONCENTRATION IN A EUTROPHIC LAKE AS A RESULT OF MACROPHYTE-KILL FOLLOWING HERBICIDE APPLICATION,
Purdue Univ., Lafayette, IN. Dept. of Bionucleonics.
M. T. Michaud, G. J. Atchison, A. W. McIntosh, R. A. Mayes, and D. W. Nelson.
Hydrobilogia, Vol 66, No 2, p 105-111, October 1979. 3 Fig, 3 Tab, 14 Ref.

Descriptors: *Aquatic weed control, *Palestine Lake(IN), *Eutrophication, *Phosphorus, *Diquat, Water pollution effects, Lakes, Shallow water, Potamogeton crispus, Ceratophyllum demersum, Lemna minor, Aphanizomenon flos-aque, Seasonal, Algicides, Macrophytes, Sediments, Water quality, Herbicides, Pondweeds.

Only a relatively small and short-term increase in phosphorus concentration occurred in Lake Palestine, Indiana, shortly after P. crispus die-off resulting from herbicide application in May 1976. Phosphorus concentrations in shallow water sediments decrease during summer; those in deep water sediments increase. Although large increases in phosphorus concentration occurred in late summer, it was not attributed to diquat. Palestine Lake, a small 93-ha highly eutrophic lake located in north central Indiana, has two basins connected by a channel; each consists of a small deep area (7-10 m) that stratifies in summer and a large relatively shallow area that completely circulates. In May 1976 diquat was applied to shallow water areas to control Potamogeton crispus which infests the lake during spring and early summer. Large numbers of Lemna minor (duckweed) appeared within a week after herbicide application; subsequent extensive reduction of macrophyte populations occurred. Three weeks after the application L. minor had decreased, and large stands of Ceratophyllum demersum (coontail) appeared. Increased numbers of L. minor were noted during late July, followed by a large bloom of Aphanizomenon flos-aque in August. Between mid April and early August ten collections of water samples from 20-cm below water surface and 20-cm above sediment bottom at three different shallow water sites were made. In addition, water samples were taken from each of two deep water areas at 2-m intervals. (Harris-Wisconsin)

ISOLATION AND IDENTIFICATION OF PATHOGENIC NAEGLERIA FROM FLORIDA LAKES,
Epidemiology Research Center, Tampa, FL.
F. M. Wellings, P. T. Amuso, S. L. Chang, and A. L. Lewis.
Applied and Environmental Microbiology, Vol 34, No 6, p 661-667, December 1977. 2 Fig, 4 Tab, 10 Ref. EPA R-804375-010.

Descriptors: *Pathogenic bacteria, *Lakes, *Florida, *Freshwater, *Public health, Human pathology, Human diseases, Amoebic meningoencephalitis, Water temperature, Sampling, On-site data collections, Naegleria, Thermal pollution, Overwintering sites, Sediments, Lake sediments, Sediment-water interfaces, Cores.

Pathogenic Naegleria survive the winter in freshwater Florida lake bottom sediments, showing that thermal-discharge pollution of waters does not play a role in maintaining natural pathogenetic Naegleria. Thirty one freshwater lakes in Florida were sampled in 1976 to determine the presence of pathogenetic Naegleria, a causative agent of primary amoebic meningoencephalitis. Twelve of 26 lakes sampled only once yield the amoeba. Three of five lakes sampled routinely reach levels of one amoeba per 25 ml of water tested during hot summer months. As water temperatures decline, isolates are obtained only from lake bottom samples in water depths 7-25 feet. Only the upper 3 in of core sample yield isolates. Freshwater lake temperatures during November and December reach a high of 26C and a low of 16C. Due to the methodology used in collecting bottom samples, actual site of cyst survival is not known. Since all core sample isolations were made from the upper 3 in, survival sites appear to be in surface bottom sediments. Indirect fluorescent-antibody techniques show that the antigenic composition of pathogenetic and nonpathogenetic Naegleria exhibits grown differences. (Harris-Wisconsin)

A STUDY OF THE ROLE OF THE SEAGRASS POSIDONIA AUSTRALIS IN THE CARBON BUDGET OF AN ESTUARY,
Commonwealth Scientific and Industrial Research Organization, North Beach (Australia). Div. of Fisheries and Oceanography.
H. Kirkman, and D. D. Reid.
Aquatic Botany, Vol 7, No 2, p 173-183, October 1979. 6 Fig, 2 Tab, 7 Ref.

Descriptors: *Port Hacking(Australia), *Leaves, *Carbon cycle, *Estuarine environments, *Marine algae, *Inlets(Waterways), Standing crops, Plant growth, Growth rates, Organic matter, Grazing, Carbon, Regression analysis, Decomposing organic matter, Degradation(Decomposition), Herbivores, Estuaries, Biomass, Floating plants, Grassed waterways, Posidonia australis, Australia.

Estimated average leaf growth was 2.3 mg C/g dwt d for seagrass Posidonia australis in Port Hacking, Australia, April 1974-September 1975. Estimated losses were 2.6 mg C/g dwt d, of which 48% was dissolved organic carbon (DOC) while grazing by herbivores (3%), leaves floating off (12%) and sinking leaves (37%) accounted for the remaining carbonaceous material lost from seagrass leaves. In summer and autumn, herbivores graze at the rate of 0.08 mg C/g leaf d. A mean of 0.136 g/sq m d or 0.3 mg C/g d of floating seagrass leaves detachs from the seagrass bed; these amounts are only 0.004% per day of the total 500 sq m seagrass bed biomass. Mean accumulation rate of leaf material or sinking particulate organic carbon is 0.45 g/sq m d or 0.96 mg C/g d. DOC release rates by seagrass leaves range 0.744-1.752 mg C/g d; results include excreted material plus DOC given off by leaf decomposition. Leaf growth over the warmer months varies 2.4-2.8 mg C/g d, while for cooler months, figures range 1.4-1.8 mg C/g d. DOC accounts for the greatest organic carbon loss from the system. The study area is part of an estuarine sunken river valley with 18 m maximum depth; the valley is cut by wide, shallow sand sills which support seagrass beds. (Danovich-Wisconsin)

REFLECTANCE SPECTROSCOPY OF MARINE PHYTOPLANKTON. PART I. OPTICAL PROPERTIES AS RELATED TO AGE AND GROWTH RATE,
University of Southern California, Los Angeles. Dept. of Biological Sciences.
D. A. Kiefer, R. J. Olson, and W. H. Wilson.
Limnology and Oceanography, Vol 24, No 4, p 664-672, July 1979. 6 Fig, 2 Tab, 19 Ref. NOAA 04-6-158-44031 and 04-6-158-44033.

Descriptors: *Reflectance, *Marine algae, *Optical properties, *Age, *Growth rates, Cultures, Phytoplankton, Spectrometers, Absorption, Light, Thalassiosira, Monochrysis, Chrysophyta, Oceans, Color, Standing crops, Cytological studies, Chlorophyll, Pigments, Spectrophotometry.

Diffuse spectral transmittance and reflectance measurements from suspensions of diatom Thalassiosira pseudonana (batch cultures) and chrysophyte Monochrysis lutheri (continuous cultures) contain information relating not only to cell concentrations but also to cell age and growth rates. Measurements yield values for the diffuse absorption coefficient, A, and diffuse backscattering coefficient, B, two parameters used to calculate effects of phytoplankton crop size on ocean color spectra. In both experiments, the ratio of absorption coefficient to backscattering coefficient, A:B, decreases with decreasing growth rate or increasing culture age. In batch cultures the ratio A:B decreases with age once the plateau phase is reached; in continuous cultures, A:B is roughly proportional to specific cell growth rates. Thus, in steady state systems, phytoplankton absorption and scattering properties appear to be an index of the growth rate or nutritional state of a given species. In batch cultures, changes in A:B for 450 and 675 nm, corresponding to maximum blue and red absorption by cells, parallels changes in the ratio of cell chlorophyll-a to cell cross section. In the red region of chlorophyll-a absorption, the magnitude of both changes is comparable. Ratio of A:B decreases with increasing age; this is caused predominantly by the loss of photosynthetic pigments however, backscattering efficiency also increases significantly. Changes in A:B are larger at the red absorption maximum of chlorophyll-a than in the blue, where accessory pigments also contribute to the absorption coefficient. REFLECTANCE SPECTROSCOPY OF MARINE PHYTOPLANKTON. PART 2. A SIMPLE MODEL OF OCEAN COLOR,

Scripps Institution of Oceanography, La Jolla, CA. Visibility Lab.
W. H. Wilson, and D. A. Kiefer.
Limnology and Oceanography, Vol 24, No 4, p 673-682, July 1979. 6 Fig, 18 Ref. NOAA 04-6-158-44031 and 04-6-158-44033.

Descriptors: *Color, *Phytoplankton, *Reflectance, *Optical properties, *Oceans, Light, Water properties, Absorption, Standing crops, Spectrometers, Growth rates, Age, Equations, Mathematical models, Mathematical studies, Physical properties, Cultures, Sargasso Sea, Diffusion, Atlantic Ocean.

A two-component (water and phytoplankton) model of ocean color is based on measurements of optical properties of phytoplankton grown in the laboratory; broad spectral changes in diffuse reflectance result not only from phytoplankton crop size but also from age or physiological state. The ratio of reflectances at two wavelengths, R (440 nm):R (550 nm), is graphed as a function of chlorophyll concentration for four spectra sets. The relationship between chlorophyll-a concentration and reflectance ratio at these two wavelengths is hyperbolic; reflectance ratios range from a high value, 6, for blue oligotrophic waters where phytoplankton contribute insignificantly to absorption and backscattering, to a low of 0.2 in yellow-green waters where phytoplankton contribute exclusively to total absorption and backscattering. At low chlorophyll concentrations when the ratio is large, it changes rapidly and at high concentrations it changes slowly. Since microscopic examinations of natural seawater generally reveal higher concentrations of brown and white detritus than living cells, older cells are probably more like detritus optically than faster growing cells. Ocean color spectra was compared with field optical measurements. Phytoplankton coefficients were determined from spectrophotometer measurements of cells grown in the laboratory; water coefficients were calculated from optical measurements made in Sargasso Sea oligotrophic waters. INTERACTION (ALLELOPATHY) BETWEEN MARINE DIATOMS: THALASSIOSIRA PSEUDONANA AND PHAEODACTYLUM TRICORNUTUM,
Delaware Univ., Lewes. Coll. of Marine Studies.
J. H. Sharp, P. A. Underhill, and D. J. Hughes.
Journal of Phycology, Vol 15, No 4, p 353-362, December 1979. 8 Fig, 3 Tab, 39 Ref.

Descriptors: *Cultures, *Diatoms, *Allelopathy, *Competition, *Inhibition, Growth rates, Phytoplankton, Population, Density, Phaeodactylum, Thalassiosira, Cytological studies, Laboratory tests, Aquiculture, Hydrogen ion concentration, Nutrient requirements, Silicates, Marine algae, Nutrients.

Evidence from single and mixed culture experiments shows that Phaeodactylum tricornutum is capable of inhibiting Thalassiosira pseudonana growth and that the dominance of the former species in uncontrolled mass algal cultures may be partially due to this effect. In two species batch cultures T. pseudonana grows more rapidly than P. tricornutum during the exponential phase; subsequently P. tricornutum continues to grow and becomes more abundant, possibly due to allelophathy. Inhibitory effects are due to filterable chemicals put into the medium from dense stationary phase cultures; chemicals manifest both a lag prior to exponential phase and lower terminal T. pseudonana population densities. The inhibitory chemical appears to be heat labile in that autoclaving removes its effect. The influence of P. tricornutum on T. pseudonana may be partially due to inorganic additions (hydroxyl ions) to the medium. Differential silicate utilization is also a consideration since P. tricornutum lacks a silicate requirement for growth. Inhibition may also be caused by a vitamin B-12 binding factor. At high growth rates P. tricornutum washes out when added at low density, whereas T. pseudonana maintains constant cell density. However, when sufficient P. tricornutum densities are added as a contaminant, both species wash out. At lower growth rates, P. tricornutum increases in density when added and eventually reaches a stable population; T. pseudonana then washes out. (Danovich-Wisconsin)

DISSOLVED AND PARTICULATE ORGANIC CARBON IN THE NORTH EQUATORIAL CURRENT OF THE ATLANTIC OCEAN,
Nederlands Inst. voor Onderzoek der Zee, Texel.
H. Postma, and J. W. Rommets.
Netherlands Journal of Sea Research, Vol 13, No 1, p 85-98, October 1979. 6 Fig, 1 Tab, 15 Ref.

Descriptors: *Carbon cycle, *Atlantic Ocean, *North equatorial current, *Organic matter, *Cycling nutrients, *Primary productivity, Carbon, Surface waters, Carbon dioxide, Diurnal, Nutrients, Nutrient transport, Sinks, Salinity, Chemical properties, Environmental gradient, Upwelling, Mixing, Currents(Water), Water circulation.

In September-October 1977 and November 1978 a study of biological systems in the North Equatorial Current of the Atlantic Ocean, focusing on organic matter cycles in upper surface layers, indicated that POC decreased east to west from an average 100 microg/l to 35 microg/l. POC differences between a day and night are 70-20 microg/l, respectively. From these differences, primary production values of 450-1000 g C/sq m yr were calculated. These values are much higher than earlier data obtained by C14 measurements. Such high productivity in subtropical ocean areas is due to rapid chemical recycling by very small microplankton standing stocks. Chemical components measured also show distinct vertical gradients. DOC decreases with depth from 1 mg/l surface values to 0.5 mg/l at 500 m; carbon dioxide (C02) increases in the same direction, 2.05 mmol/l at the surface and 2.3 mmol/l at 500 m. DOC and C02 are inversely related with a 1:6 ratio. Downward DOC transport calculated from vertical gradients is 8 g/sq m yr. The highest POC concentrations (>100 microg/l) are found in surface waters; the lowest amounts (<20 microg/l) occur in deeper water. Salinity is highest in the upper layers, with values over 36 ppt, and decreases with depth. Upwelling occurs at some stations and is indicated by rising isohalines. A density discontinuity layer is present at 40-75 m. Below this discontinuity layer, a salinity maximum is found; the highest salinity is 37.2 ppt. The salinity maximum represents surface water from the north that has descended below the discontinuity layer and flows south. (Danovich-Wisconsin)

AN INVESTIGATION OF HETEROTROPHIC AND PHOTOHETEROTROPHIC CAPABILITIES IN MARINE PYRRHOPHYTA,
Harvard Univ., Cambridge. Biological Labs.
L. C. Morrill, and A. R. Loeblich, III.
Phycologia, Vol 18, No 4, December 1979, p 394-404. 6 Fig, 1 Tab, 44 Ref. NSF DEB 78 25621.

Descriptors: *Heterotrophy, *Pyrrhophyta, *Dinoflagellates, *Light, *Speciation, *Growth rates, *Nutrient requirements, Biochemistry, Photosynthesis, Cultures, Nitrogen, Organic compounds, Organic matter, Algae, Metabolism, Plant physiology, Plant growth, Substrates, Soils, Laboratory tests, Darkness, Marine algae.

Eight marine dinoflagellates were investigated for possible heterotrophic and photohetrotrophic growth on 54 organic substances; in all but two organisms, the highest or second highest growth rates under photosynthesis limiting conditions occurred with glycerol. Because glycerol concentrations used in experiments are high (54 mM) relative to organic carbon concentrations in seawater, it is doubtful that these compounds play a major role in trophic strategies of marine dinoflagellates. In some organisms in the presence of DCMU, soil extract allows higher growth rates than glycerol. Despite widespread capability of photoheterotrophic glycerol utilization, true heterotrophy does not occur among organisms tested in darkness. When Peridinium foliaceum is tested in glycerol, some cells continue to swim for as long as two weeks. Inability to grow on glycerol in the dark results from the inability to take up glycerol rapidly enough to provide sufficient energy to divide. Dinoflagellates are also sensitive to high glycerol concentrations; the maximum which P. foliaceum tolerates is 250 mM. High glycerol concentrations are inhibitory because of osmotic effects. Soil extracts do not support photoheterotrophic growth in any organism tested under dim light. Nitrogen limited cultures of P. foliaceum and free-living Zooxanthella microadriatica are capable of using soil extract as a nitrogen source. Other species tested include Cachonina niei, P. balticum, symbiotic Z. microadriatica, Amphidinium carterae, Fragilidium heterolobum and a second isolate of P. foliaceum. (Danovich-Wisconsin)

The energetic consequences of heated effluent from a 220 MW generating plant on the growth and production of bluegill in a 1400 ha eutrophic lake were analyzed. The heated effluent altered temperatures of 1-2% of the lake surface area or 2.6% of its littoral zone. Average temperatures in the outfall area did not exceed 30C. During summer an average of 6-7% of the bluegill in the lake were estimated to be in the outfall area. In winter bluegill released near the outfall tended to remain in the heated water and remained closer to shore than in other seasons. Growth of bluegill was compared between the outfall and reference area from measurements of fish held in each area in enclosures, and from growth simulation using a bioenergetic model for fish growth. Fish in cages usually grew more rapidly in the outfall, but simulated growth was slightly lower in the outfall area. A strong argument cannot be made for major effects of the heated effluent on growth. Based on the observed growth of caged fish and high population density in the outfall area, small bluegill in the littoral zone may have a 20% enhancement of production during summer. The results indicate that a small electric generating station in an urban area can use the local eutrophic lake as a source of once-through cooling water without negative effects on the growth and production of the dominant warmwater fishes. Descriptors: *Toxicity, *Fish, *Detergents, *United Kingdom, *Germany, Toxins, Water quality, Water quality standards, Speciation, Testing, Testing procedures, Laboratory tests, Lethal limit, Pollutants, Water pollution effects, Water pollution, Fish types, Fish physiology, Brown trout.

Results from a 1973 interlaboratory ring test to assess acute toxicity of 11 detergents to fish in the United Kingdom and Germany demonstrate that a reliable order of magnitude for acute toxicity is obtained by a variety of test fish and procedures. The golden orfe (Idus idus melanotus) was tested in Germany and harlequin fish (Rasbora heteromorpha) and rainbow trout (Salmo gairdneri) were tested in the United Kingdom. German tests use only one standard method while the United Kingdom series employs six different methods. LC50 values for each detergent obtained by various methods and fish species are all within the same order of magnitude. When considering the average 48-h LC50 values, brown trout tends to yield lower values than other species and taken overall, the golden orfe and harlequin fish have approximately the same sensitivity towards detergents. Both German and U.K. tests rank detergents 10, 4, 1 and 6 as least toxic and detergents 5, 9 and 3 as most toxic. Acute toxicity tests cannot be used alone in setting water quality standards but only in conjunction with other data such as biological and chemical oxygen demand, biodegradability, compound amounts likely to reach surface waters, uptake and metabolism by aquatic organisms, longer lethal and sublethal effects, together with receiving water chemical and physical characteristics. Products resulting from biodegradation should also be tested for acute toxicity. (Danovich-Wisconsin)

Physiochemical measurements December 1976-August 1977 of Bhathwa Pokhar, a freshwater wetland at Darbhanga, India, showed that dissolved carbon dioxide was higher and that oxygen, pH and temperature fluctuations were lower under water hyacinth areas than in open water. The extent of difference depends on the time of day and season. Due to extreme hypercarbic and hypoxic conditions most vertebrates living in hyacinth infested areas are air breathers such as water snakes and turtles or supplemental air breathers such as frogs and air-breathing fish. High carbon dioxide and low oxygen concentrations are due to high anaerobic decomposing mat leaves and detritus, increased respiratory activities of organisms, and decreased photosynthetic rates caused by water hyacinth shadowing effects over the water surface. Oxygen is very low under water hyacinth mats (always less than 2 ppm) and during the summer oxygen levels are reduced to zero in both infested and uninfested water areas. Dissolved oxygen reaches its lowest value in late night hours (4 A.M.) and peaks in the afternoon; the maximum value is 7 ppm in clear areas during winter. Bhathwa Pokhar is a shallow (1.5 m mean depth), small (1.5 ha), swampy pond and 98% area is covered by water hyacinth. The source of pond water is Darbhange Medical College campus sewage. PHOSPHORUS IN A MODEL POND STUDY: I SEDIMENT SELECTION AND PREPARATION,
Science and Education Administration, Durant, OK. Water Quality Management Lab.
A. Olness, W. W. Troeger, G. D. Pardue, and R. R. Huckleberry.
Hydrobiologia, Vol 63, No 1, p 11-15, March 1979. 2 Fig, 3 Tab, 9 Ref.

Descriptors: *Soil chemistry, *Soil types, *Fertilizers, *Phosphorus, *Adsorption, *Sediments, Soil properties, Soil erosion, Soil texture, Soils, Nutrients, Phosphates, Erosion, Ponds, Water pollution sources, Nutrient removal, Fertilization, Chemical properties, Loam.

Test results on two surface soils with contrasting textures show that any soil fertilizer additions increase the equilibration concentrations of soil suspensions and that erosion of fertilized soil increases phosphorus concentrations in reservoirs; however, due to buffering the increase in equilibrium phosphorus concentrations is not proportional to fertilizer phosphorus additions. Transformations of adsorbed phosphorus to fixed or non-exchangeable forms occurs more rapidly in some soils and further reduces fertilization effects. Soils tested included San Saba clay and Bowie loam. San Saba soil contains three times as much clay (45%), six times as much total phosphorus (415 micro g/g), four times as much inorganic phosphorus (225 micro g/g) and over three times as much organic carbon (3.5%) compared with Bowie soil. Both have near-neutral pH. San Saba soil contains significant amounts of carbonate (4.2%) whereas Bowie soil is virtually carbonate free. Phosphorus adsorption limits obtained with Langmuir adsorption model are > 200 micro g/g and 50 micro g/g for San Saba and Bowie soils, respectively. Phosphorus adsorption is proportional to soil surface area and clay content. San Saba soil has a larger buffering capacity and browder buffering range than Bowie soil. Significant phosphate fixation takes place in clay soil but no fixation occurs in loam soil. (Danovich-Wisconsin)

DENITRIFICATION BY THE SESSILE MICROBIAL COMMUNITY OF A POLLUTED RIVER,
Tokyo Metropolitan Univ. (Japan). Dept. of Biology.
T. Nakajima.
Hydrobiologia, Vol 66, No 1, p 57-64, September 1979. 2 Fig, 4 Tab, 19 Ref.

Descriptors: *Denitrification, *Sessile algae, *Tamagawa River, Japan, *Water pollution effects, Nitrogen, Sewage effluents, Microorganisms, Water pollution, Tracers, Water temperature, Municipal wastes, Gases, Laboratory tests, Ammonia, Bacteria, Nitrates, Nitrites, Rivers, Metabolism, Plant physiology.

Denitrification by the sessile microbial community in the Tamagawa River, Japan is demonstrated by data collected 1974-1977. Loss of total inorganic nitrogen (sum of ammonia-, nitrite-, and mitrate-nitrogen) was observed when river water was incubated with sessile microorganisms in an artificial stream. In very polluted water areas, the loss was 1 mg N/1/d. This loss is due to inorganic nitrogen assimilation by sessile microbes and denitrifying bacteria which numbered 10 million cells/sq cm. Denitrification is confirmed by using N15 as a tracer. Dinitrogen evolved from labeled nitrate for both sessile microbial communities taken from unpolluted and polluted areas, even though they were incubated with oxygenated river water. The denitrification rate by sessile microbial communities taken from a very polluted area is 8-16 mg N/sq m/d and rises to 74-230 mg N/sq m/d when water temperatures increase from 14 to 30C. The N2 Ar ratio of gases evolved from the river bed is higher than that of air, suggesting in-situ denitrification. The Tamagawa River is located in the southwest part of Tokyo and is heavily polluted with municipal sewage. (Danovich-Wisconsin)

DIVERSITY AND INDICATOR SPECIES AS MEASURES OF WATER POLLUTION IN A SUBARCTIC LAKE,
J. W. Moore.
Hydrobiologia, Vol 66, No 1, p 73-80, September 1979. 4 Fig, 36 Ref.

Descriptors: *Speciation, *Water pollution, *Population, *Heavy metals, *Great Slave Lake(Canada), *Bioindicators, Mine wastes, Mineral industry, Indicators, Benthic fauna, Subarctic, Yellowknife Bay(Canada), Pollutant identification, Environmental effects, Invertebrates, Chironomidae, Mollusks, Effluents, Waste water(Pollution), Density, Canada.

Diversity indices and indicator species are ineffective in monitoring heavy metal pollution in Yellowknife Bay, situated on the north shore of Great Slave Lake, Northwest Territories, Canada, June-September 1976; however, density estimates provide a better assessment of subarctic pollution. The density of benthic organisms averages 100 animals/sq m near the effluent discharge point. At 1.5 km east and south of the discharge point, density reaches 1,000 animals/sq m. A total of 25 benthic invertebrates species occur within the most heavily impacted zone (100 animals/sq m). Procladius denticulatus is most abundant (18-30%), followed by Heterotrissocladius changi (12-21%) and Pisidium casertanum (9-15%). In moderately polluted areas (100-1,000 animals/sq m), 25 species occur; 22 of these are also found in the most heavily polluted area. H. changi is most important (18-33%), followed by P. denticulatus (11-20%) and P. casertanum (4-11%). In minimally impacted areas (1,000 animals/sq m), 23 species are found; 18 of these also occur near the effluent discharge point. H. changi accounts for 11-29% of benthic community numbers. Results show that in subarctic areas, diversity index does not monitor water pollution. Total species numbers are similar in all three impact areas. Moreover, percentage contribution of dominant community species are comparable throughout the study area. Sediments near the mine discharge contain high heavy metal concentrations: arsenic (2,500 mg/kg dwt); mercury (500 micro g/kg); lead (850 mg/kg); copper (750 mg/kg) and zinc (950 mg/kg). (Danovich-Wisconsin)

DISTRIBUTION AND ABUNDANCE OF ATTACHED, LITTORAL ALGAE IN 21 LAKES AND STREAMS IN THE NORTHWEST TERRITORIES,
J. W. Moore.
Canadian Journal of Botany, Vol 57, No 6, p 568-577, March 1979. 4 Fig, 3 Tab, 46 Ref.

Descriptors: *Sessile algae, *Northwest territories(Canada), *Lakes, *Streams, *Baseline studies, Aquatic plants, Epilithic, Epiphytes, Yellowknife(Canada), Great Slave Lake(Canada), Great Bear Lake(Canada), On-site data collection, Algae, Plant populations, Distribution, Littoral, Sediments, Sands, Substrates, Density, Biomass, Canada.

Four types of sessile, littoral algae were collected from 18 lakes and three streams in an area directly north-northeast of Yellowknife, Canadian Northwest Territories. Collections of algae attached to

rocks (epilithic), sediments (epipelic), higher plants (epiphytic) and sand grains (epipsammic) were made during 1975-1976 to determine population species composition and density. Tabellaria flocculosa is dominant among epilithic and epipelic species, with maximum density of 50-250 million cu micro m/sq cm. Of secondary importance are Achnanthes minutissima, Navicula spp., and Nitzschia frustulum, at densities of 10-30 million cu micro m/sq cm. The only two common epiphytic taxa, A. minutissima and T. flocculosa, maintain populations of 100-130 million cu micro m/sq cm; the most common epipsammic species (Amphora ovalis, Fragilaria construens, Achnanthes minutissima and A. pinnata) reach maxima of 4 million cu micro m/sq cm. For all sessile algae studied, the growing season is June -October. All four algal types have unimodal growth, reaching maximum in either July or August. Growing season stops in mid-October with freezeover of lakes and rivers. All lake samples were collected from the shoreline in less than 1 m of water. Collections in the three streams were made in still-water pools midstream, also at less than 1 m depth. (Harris-Wisconsin)

SALINITY INFLUENCE ON THE ECOLOGY OF PHYTOFLAGELLATE BLOOMS IN LOWER NEW YORK BAY AND ADJACENT WATERS,
National Marine Fisheries Service, Highlands, NJ. Sandy Hook Sport Fisheries Marine Lab.
J. B. Mahoney, and J. J. A. McLaughlin.
Journal of Experimental Marine Biology and Ecology, Vol 37, No 3, p 213-223, March 1979. 2 Fig, 1 Tab, 16 Ref. EPA R 803370030.

Descriptors: *Saline water-freshwater interfaces, *New York Bright, *Salt tolerance, *Marine algae, Estuaries, Saline water intrusion, Estuarine environments, Eutrophication, Olisthodiscus luteus, Massartia rotundata, Prorocentrum micans, Dinoflagellates, Phytoflagellates, Stress, Stress analysis, Laboratory tests, Cultures, Ecology, Growth rates, Salinity, *Lower New York Bay.

Salinity tolerances of phytoflagellates dominant in Lower New York Bay blooms are examined, with particular attention to possible river-ocean transition effects. Salinities in these waters range 15-32%. Cultures of Olisthodiscus luteus, Massartia rotundata and Prorocentrum micans were isolated and grown under laboratory simulation of change from brackish-river to ocean water salinities. Massartia grows well in the 20-33% salinity with optimum at 24-30%, and does not grow at salinities < 14% or > 40%. With preconditioning at 30%, the favorable salinity range shifts slightly higher (21-36%); but, optimum range is nearly the same. Lowest tolerated salinity is again 14% but growth is comparatively reduced up to 16%. Salinities higher than 40% permit growth. Olisthodiscus grows well in 6-42% salinity when preconditioned at 20%, and at 6-46% when preconditioned at 30%. Optimal ranges are wider and higher than for Massartia (10-36%) with no significant shift from inocula preconditioning. In higher salinities, growth of the two inocula is approximately the same except for 46%, at which only the 30% salinity inoculum grows. Prorocentrum preconditioned at 20% has good growth in 18-38% salinity, with optimum growth between 20-36% salinity; lower tolerance level is 6%. Preconditioning at 30% causes this species to grow well at salinities of 20% and higher, but the optimum range shifts to 27-46%, and the lower tolerance limit is high at 10%. Independent of culture preconditioning, optimum salinities are 27-36%. It is speculated that salinity stress may temporarily affect development of Massartia and Olisthodiscus blooms. W80-04351

ABUNDANCE, POPULATION DYNAMICS AND PRODUCTION OF ZOOBENTHOS IN LAKE MYVATN, ICELAND,
Copenhagen Univ. (Denmark). Freshwater Biological Lab.
C. Lindegaard, and P. M. Jonasson.
Oikos, Vol 32, No 1-2, p 202-227, 1979. 13 Fig, 24 Tab, 41 Ref.

Descriptors: *Lake Myvatn(Iceland), *Baseline studies, *Benthic fauna, *Secondary productivity, Iceland, Aquatic microorganisms, Benthic flora, Tanytarsus gracilentus holmgren, Chironomus islandicus keiffer, Tubifex tubifex muller, Sampling, Food chains, Subarctic, Lakes, Polar regions, Cold regions.

Lake Myvatn is a large (38 sq km), shallow (maximal depth 4 m) northeastern Icelandic lake with an irregular shoreline and some 30 islands. The macrozoobenthos was sampled from depths of 1.5 and 4 m at six stations during 1972-1974, and at one station during 1975-1976. The sampling has produced evidence of 20 macrozoobenthic species. The macrozoobenthic distribution averages 64,500 individuals/sq m. Three species are the most common: Tanytarsus gracilentus Holmgren (79.4%), Chironomus islandicus Keiffer (9.3%), and Tubifex tubifex Muller (7.2%). The relative abundances of T. gracilentus and C. islandicus can be explained in terms of their respective annual life-cycles. T. gracilentus has two generations in one year and therefore it is more common than C. islandicus which has a two year life-cycle. During 1972-1974, the mean annual production of the total benthos community was 28.4 g/sq m, or about 1,000 tons ash free dry weight for the whole lake. T. gracilentus, C. islandicus, and T. tubifex contribute 67.1%, 23.6%, and 2.7% respectively, to total benthos production. Large annual fluctuations in production occurred during 1972-1974. These were traced to fluctuations of C. islandicus and T. gracilentus. In 1975-1976, both species disappeared from the only station where the sampling was conducted during that period. It is not certain if their disappearance is applicable to the whole lake. (Harris-Wisconsin)

NOTES ON THE GROWTH AND SPORULATION OF A NATURAL POPULATION OF APHANIZOMENON FLOS-AQUAE,
New Univ. of Ulster, Coleraine (Northern Ireland). Limnology Lab.
R. I. Jones.
Hydrobiologia, Vol 62, No 1, p 55-58, January 1979. 1 Fig, 16 Ref.

Descriptors: *Cyanophyta, *Lough Neagh(Northern Ireland), *Spores, *Germination, *Life history studies, Phytoplankton, Algae, Eutrophication, Population, Population dynamics, Nitrates, Nitrogen, Hydrogen ion concentration, Density, Growth rates, Nutrients, On-site investigations, Northern Ireland.

Observed Aphanizomenon flos-aquae sporulation in 1973 in Kinnego Bay, a highly eutrophic part of Lough Neagh, North Ireland, was probably induced by high pH values caused by dense phytoplankton crops; other measured environmental factors were favorable to Aphanizomenon growth at this time. Aphanizomenon growth was observed in 1973-1974. Sporulation activity occurred only in June, 1973. Exponential growth continued well after sporulation and two secondary growths produced smaller populations than the first, but akinete production was not observed. Akinete production was not observed in 1974; Aphanizomenon growth was slight due to unfavorable conditions for nitrogen-fixing blue-green algae. Algal growth is related to dissolved nitrate-nitrogen in the water. Surficial algal accumulations were not observed in Kinnego Bay; the shallow (mean depth 2.1 m) water column is well mixed at all times. However, in June 1973, Aphanizomenon population density was the highest recorded (8.6 cu mm/l or 7,600 filaments/ml). High densities of photosynthesizing algae can greatly deplete dissolved carbon dioxide levels, leading to high pH values. When akinetes were produced, pH was 9.33-9.61. (Danovich-Wisconsin)

THE LAKE MYVATN ECOSYSTEM, ICELAND,
Copenhagen Univ. (Denmark). Freshwater Biological Lab.
P. M. Jonasson.
Oikos, Vol 32, No 1-2, p 289-305, 1979. 5 Fig, 8 Tab, 70 Ref.

Descriptors: *Lake Myvatn(Iceland), *Reviews, *Baseline studies, *Water quality, Iceland, Bibliographies, Subarctic, Lakes, Polar regions, Cold regions, Water temperature, Trophic level, Lake morphometry, Shallow water, Solar radiation, Rainfall intensity, Primary productivity, Diatoms, Phytoplankton, Benthos, Zooplankton.

The literature on the current physical, chemical, and biological conditions in Lake Myvatn is reviewed. Lake Myvatn, a shallow productive subarctic lake in the northeastern part of Iceland, consists of two basins connected by a narrow stretch of water. The lake bottom contains a layer of diatoms several meters thick and partially covered by macrophytes in the northern basin, and by Cladophora aegagropila in the southern basin. The lake has a phytoplankton production of 118 g C/sq m/year in the southern basin, and 75 g C/sq m/year in the northern basin, which is unusually high for the latitude. Seasonal succession is unimodal. High production due to Anabaena flos-aque coincides with high solar radiation, high temperature and time of ice-break. At other seasons production is low despite considerable biomass of diatoms and chrysophyceans. Net production of benthic diatoms amounts to 2220 kcal/sq m/year. Calculated production of C. aegagropila is 500 kcal/sq m/year. Macroepiphytes and epiphytes are important in the northern basin. A living substratum of Cladophora and macrophytes stabilizes the sediment and acts as sieve for resuspended organic matter. Substrate type and zoobenthos abundance and production show close relationship. Benthic crustacea produce 10 kcal/sq m/year in both basins. Zooplankton produced 43 and 15 kcal/sq m/year in the southern and northern basins respectively. Fish produced 3 kcal/sq m/year, and ducks produced 0.5 kcal/sq m/year, thus suggesting that energy flow is mainly channeled through phytobenthos and zoobenthos. (Harris-Wisconsin)

THE RATES OF DRY MATTER AND NUTRIENT LOSS FROM DECOMPOSING POTAMOGETON PECTINATUS IN A BRACKISH SOUTH-TEMPERATE COASTAL LAKE,
Rhodes Univ., Grahamstown (South Africa). Inst. for Freshwater Studies.
C. Howard-Williams, and B. R. Davies.
Freshwater Biology, Vol 9, No 1, p 13-21, February 1979. 3 Fig, 2 Tab, 36 Ref.

Descriptors: *Decomposing organic matter, *Ecology, *Submerged plants, *Lakes, *Swartvlei Lake(South Africa), Detritus, Potamogeton pectinatus, Sago pondweed, Aquatic microorganisms, Nitrogen, Phosphorus, Potassium, Food chains, Littoral areas, Benthos, Shallow water, Benthic flora, Benthic fauna, Macrophytes, Biodegradation, Degradation(Decomposition), South Africa.

The rate of decomposition of the macrophyte Potamogeton pectinatus was studied in Swartvlei, a brackish south-terperate African Lake, during summer 1976, to asscertain the role of macrophytes in lake systems. Fifty litter bags were filled with 15 g of Potamogeton shoots (dry weight) collected prior to shoot die-off. Litter bags allowed the passage of macroinvertebrates which may play an important role in the breakdown process. Bags were suspended just below the surface within the Potamogeton community in two series; one at 2 m depth and the other at 1 m depth. Five bags from each series were harvested at 7, 15, 30, 90, 128, and 158 days. Contents were dried and analyzed for ash, phosphorus, potassium and nitrogen. Overall decay follows an exponential curve. The rate constant is 0.0205 per day. After 158 days, less than 5% of the original dry weight remained in the litter bags of both shallow water and deep-water series. There was no difference in changes of ash, nitrogen, phosphorus and potassium percentages between shallow water and deep water samples. The original stock of ash, phosphorus and potassium was lost more rapidly than dry matter in initial decomposition stages due to leaching. Almost the entire stock of potassium and 60% of phosphorus was lost in the first seven days. However, at 90 days phosphorus levels in the decomposing detritus rose significantly. Nitrogen levels in detritus decomposed slowly throughout the first

90 days and then remained constant. The significance of the decomposition rate of P. Pectinatus is discussed in terms of the Swartvlei Lake ecology. (Harris-Wisconsin)

INORGANIC MINERAL NUTRIENT LEVEL STUDIES ON POTAMOGETON PECTINATUS L. AND ENTEROMORPHA PROLIFERA IN FORFAR LOCH, SCOTLAND,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
Y. B. Ho.
Hydrobiologia, Vol 62, No 1, p 7-15, January 1979. 2 Fig, 5 Tab, 40 Ref.

Descriptors: *Pondweeds, *Forfar Loch(Scotland), *Plant tissues, *Inorganic compounds, *Water chemistry, *Nutrients, Macrophytes, Aquatic plants, Plant physiology, Sodium, Chemical analysis, Biochemistry, Sewage effluents, Correlation analysis, Nitrogen, Phosphorus, Calcium, Potassium, Scotland.

Nutrient levels present in the pondweeds Potamogeton pectinatus and Enteromorpha prolifera during summer 1976 in Forfar Loch, Scotland were generally high, reflecting high nutrient levels in loch waters. Nutrient levels in both Potamogeton and Enteromorpha are well above critical concentrations, reaching averages of 50 mg dwt/g nitrogen (N) and 6 mg dwt/g phosphorus (P). Nutrient levels in Forfar Loch waters are not limiting even at the height of the growing season. Potamogeton tissue N positively correlates (r=0.805) with water inorganic N level; tissue P also correlates (r=0.941) with phosphate water contents. N levels in Enteromorpha do not correlate with N water contents; the same is true for P. Calcium (Ca) content in Potamogeton (r=-0.649) and Enteromorpha (r=-0.763) negatively correlates with loch water Ca levels, mainly due to Ca precipitation from water onto the plant surface during high photosynthetic activities coupled with high water pH levels. Potassium (K) levels in Enteromorpha negatively correlate (r=-0.439) with K levels in loch water. No correlation is detected for sodium (Na) in both Forfar plants. Overall N and P levels are high and similar; Potamogeton N levels vary 40.4-60.1 mg/g, P levels vary 4.62-8.09 mg/g, Enteromorpha N levels vary 49.4-52.6 mg/g, P levels vary 5.08-7.54 mg/g. Enteromorpha has greater ash content and Ca and Mg levels than Potamogeton, however, the reverse is true for K, Na, and Fe levels. Potamogeton has ten times more sodium than Enteromorpha. OUTDOOR ALGAL MASS CULTURES-II. PHOTOSYNTHETIC YIELD LIMITATIONS,
Woods Hole Oceanographic Institution, MA.
J. C. Goldman.
Water Research, Vol 13, No 2, p 119-136, 1979. 14 Fig, 1 Tab, 74 Ref. DOE EG-77-S-02-4151.

Descriptors: *Algae, *Cultures, *Photosynthesis, *Light intensity, *Growth rates, Biomass, Nutrients, Temperature, Limiting factors, Depth, Flow, Flow characteristics, Light, Primary productivity, Algal growth potential, Aquiculture, Curves, Equations, Mathematical models, Physics.

At best conversion efficiencies of total sunlight, theoretical models predict and actual data reveal that 30-40 g dwt/sq m d algal biomass in outdoor cultures can be obtained in the short-term. On a bioengineering basis, the major challenge is to design large-scale outdoor cultures so as to achieve maximum potential yields consistently as a function of available sunlight intensity. Consideration must be given not only to flow rate and depth which control light utilization efficiencies, but also to many other factors affecting algal growth such as mixing, temperature, nutrient supply, pH control, and predator control. Although algal growth rates increase with temperature, respiratory and other decay processes are also influenced. The net effect is that temperature is not nearly as important as sunlight in controlling productivity. Maximal algal yields attained in various locations with different species and growth systems consistently have been 30-40 g dwt/sq m d. Based on productivity curves, 30-40 g dwt/sq m d represents an upper limit in achievable productivity; this figure is also consistent with energy balance curves. Energy balance curves are based on the most liberal considerations including the Bush equation, no decay and no light inhibition. (Danovich-Wisconsin).

A STATISTICAL MODEL FOR SMALL LAKE WATER QUALITY MANAGEMENT,
De Paul Univ., Chicago, IL.
J. Ciecka, R. Fabian, and D. Merilatt.
Water Resources Bulletin, Vol 15, No 5, p 1318-1330, October 1979. 2 Fig, 2 Tab, 12 Ref, 1 Append.

Descriptors: *Eutrophication, *Lakes, *Vollenweider models, *Phosphorus, *Water quality, *Statistical models, Trophic level, Nutrients, Nutrient loading, Lake restoration, Statistics, Regulation, Water quality standards, Decision making, Curves, Equations, Illinois, Recreation, Priorities.

Statistical analysis based on an estimated discriminant function provides support for the hypothesis that Vollenweider models can be applied validly to relatively shallow, fast-flushing lakes. The statistical model extends the Vollenweider and Dillon results by associating each alternative phosphorus loading with a probability that a given lake can achieve or maintain noneutrophic status. Data were initially taken from 27 eutrophic Illinois lakes; the sample size was enlarged to include additional lakes from New York, New England and the Great Lakes states resulting in a sample of 195 lakes, 35 of which were noneutrophic. On the basis of minimal limnological information, together with knowledge of point and nonpoint phosphorus contributions and technological data on nutrient control, quantitative supply priorities can be developed. Application of the model to several Illinois lakes indicates a wide tolerance range for phosphorus intrusion, suggesting that uniform phosphorus standards are not a desirable approach for regulatory agencies to pursue. Maximization of net present expenditures on water quality requires an approach capable of utilizing information provided by Vollenweider's model. The discriminant function provides an important component in a complete cost-benefit analysis of small lake water quality management. The paper concludes with a comparison of the Vollenweider approach to that of Reckhow, who developed a function capable of predicting lake anoxic or oxic conditions; results of both approaches are complimentary. NITROGEN FIXATION IN A NITROGEN-LIMITED IMPOUNDMENT,
National Inst. for Water Research, Pretoria (South Africa).
P. J. Ashton.
Journal of the Water Pollution Control Federation, Vol 51, No 3, p 570-579, March 1979. 6 Fig, 1 Tab, 28 Ref.

Descriptors: *Nitrogen fixation, *Impoundments, *Eutrophication, *Water quality control, *Rietvlei Dam(South Africa), Pretoria(South Africa), Nitrogen cycle, South Africa, Reservoirs, Cyanophyta, Anabaena circinalis, Microcystis aeriginosa, Monitoring, Potable water, Kempton Park(South Africa), Phosphorus, Trophic level, Waste water(Pollution), Water pollution effects, Algae, Limiting factors, Eutrophication, Algal blooms.

Water temperature is the major factor regulating the duration of algal blooms. Rietvlei Dam, a warm monomictic lake near Pretoria, South Africa. The dam is a source of potable water for Pretoria and is highly eutrophic; Rietvlei receives secondary treated domestic and industrial wastewater effluents by way of the lake's main feeder stream. The study was initiated October 1975 when a large bloom of Anabaena circinalis Rabenhorst, a heterocystous nitrogen-fixing blue-green alga, occurred in the impoundments. On the basis of two 12-hr field studies and routine monitoring, the total amount of nitrogen fixed by the bloom of A. circinalis October 22 - December 17, 1975 is estimated at 1.13 metric tons. On an annual basis, nitrogen fixed by this alga is approximately equivalent to 19.4% of the loading from the feeder stream. A large portion of the fixed nitrogen is released after the death of the Anabaena cells and becomes available to other species, notable Microcystis aeriginosa. The magnitude of algal blooms of species other than A. circinalis in Rietvlei Dam depends on the supply of available nitrogen in the water phase, inasmuch as this is the primary growth limiting nutrient. Control of the phosphorus in put is considered a key factor to prevent algal growth problems in Rietvlei. (Harris-Wisconsin)

THE SEASONAL CYCLE OF THE PHYTOPLANKTON IN THE COASTAL WATERS OF GHANA,
Fisheries Research Unit, Tema (Ghana).
E. R. Anang.
Hydrobiologia, Vol 62, No 1, p 33-45, January 8, 1979. 13 Fig, 39 Ref.

Descriptors: *Ghana, *Seasonal, *Upwelling, *Phytoplankton, *Tropical regions, *Population dynamics, Marine algae, Atlantic Ocean, Littoral, Diatoms, Water temperature, Salinity, Nitrates, Phosphates, Silicates, Cycling nutrients, Nutrients, Correlation analysis, Coasts, Population, Physicochemical properties.

A study was made to determine seasonal changes in quality and quantity of Ghana offshore phytoplankton population and to relate such changes to physico-chemical factors such as temperature, salinity, and nutrients. Phytoplankton peak numbers correlate well with low nutrient levels during upwelling, with an inverse relationship during other times. Nutrient release takes place rapidly with disappearance of the bloom. Ghana, with a subequatorial climate, experiences major upwelling in coastal Atlantic waters in July-October and minor upwelling in December-January. The major upwelling season is characterized by lowest surface water temperatures (<25C), highest salinity (>35%), and high nutrient concentrations. The minor upwelling period brings a small temperature decrease and an increase in salinity and nutrient concentration. Other times of the year are marked by high surface water temperatures, low salinity and low nutrient concentrations. Phytoplankton cell counts are also seasonal, with values greater than 1 million cells/l during major upwelling and a small increase during minor upwelling. Dinoflagellates almost disappear during both upwelling periods. Diatoms dominate most of the year and constitute more than 90% of the phytoplankton cell counts during major upwelling. Cell numbers and concentrations of nitrate, phosphate and silicate fluctuate, especially during upwelling. (Harris-Wisconsin)

DYNAMICS AND SUCCESSION OF THE PHYTOPLANKTON IN A TROPICAL LAKE: LAKE LANAO, PHILLIPINES,
Colorado Univ., Boulder. Dept. of Environmental, Population and Organismic Biology.
W. M. Lewis, Jr.
The Journal of Ecology, Vol 66, No 3, p 849-880, November 1978. 12 Fig, 2 Tab, 57 Ref. NSF GB 16054 and GB 41293.

Descriptors: *Phytoplankton, *Succession, *Plant populations, *Environmental gradient, *Lake Lanao(Philippines), Biomass, Nutrient requirements, Tropical regions, Temperate, Cyanophyta, Dinoflagellates, Aquatic microorganisms, Grazing, Light intensity, Sinking rate, Diatoms, Cryptomonads, Algae, Philippines.

At tropical lake Lanao, Philippines, analysis of growth fluctuations and growth correlations in the major phytoplankton classes provides evidence that the niche space divides in response to nutrient and light availability. Weekly abundance measurements were made of 70 phytoplankton species August, 1970- October, 1971. Maximal growth in diatoms and cryptomondas occurs during low light and high nutrient availability. Growth maxima for green algae, blue-green algae and dinoflagellates occur successively toward the high light and low nutrient end of the spectrum. Placement of species in terms of their growth responding to light availability and nutrient availability gradients creates a taxonomic pattern similiar to that observed in the class-level analysis of succession. Grazing rate and sinking rate of cells are the measurable factors governing loss of autotroph mass. Individual phytoplankton species separate better on the basis of different sinking rates. Diatoms and cryptomonads prefer high turbulence. Blue-green algae and dynoflagellates do not thrive in minimal turbulence, and green algae occupy middle range of conditions. In contrast to temperage lakes, phytoplankton succession in Lake Lanao consists of a series of numerous episodes initiated by abrupt changes in abiotic factors. However, events within any given episode bear resemblance to intra-episode events in temperate lakes. (Harris-Wisconsin)

LAKE MACROPHYTES AS THE FOOD OF ROACH (RUTILUS RUTILUS L.) AND RUDD (SCARDINIUS ERYTHROPHTHALMUS L.) I. SPECIES COMPOSITION AND DOMINANCE RELATIONS IN THE LAKE AND FOOD,
Warsaw Univ. (Poland). Dept. of Hydrobiology.
A. Prejs, and H. Jackowska.
Ekologia Polska, Vol 26, No 3, p 429-438, 1978. 7 Tab, 4 Ref.

Descriptors: *Submerged plants, *Masurian Lakes(Poland), *Fish diets, Rooted aquatic plants, Roach fish, Rudd fish, Lake Beldany(Poland), Lake Warniak(Poland), Lake Mikolajskie(Poland), Fish food organisms, Elodea canadensis, Characeae, Ceratophyllum demersum, Potamogeton pectinantus, Potamogeton lucens, Batrachium circinatum, Macrophytes, Size, Poland.

Submerged macrophyte food contributions to different sizes of two fish species were investigated in three eutrophic lakes in the Masuria district of northern Poland. Macrophytes in roach fish diets do not exceed 35% of total food weight in lakes Beldany and Mikolajskie but achieve 90% in roach from Lake Warniak. The percentage of macrophytes in rudd fish diets vary with fish size; it does not exceed 15% for individuals less than 7 cm body length, whereas it reaches 85-99% of total food weight for individuals longer than 16 cm. In the macrophytes eaten by the roach, Elodea canadensis dominates. Characeae and Certophyllum demersum are also important in Lake Mikolajskie roach, and C. demersum and Potamogeton pectinatus in Lake Warniak roach. E. Canadensis dominates in rudd diets from lakes Mikolajskie and Warniak, whereas C. demersum and E. canadensis dominate in the macrophyte eaten by Lake Beldany rudd. No essential differences occur in composition and dominance structure of macrophytes consumed by different size classes of fish. Similarly, the number of macrophyte species found in guts of different size fish do not vary. In each intenstine, macrophyte fragments represent an average of 2-3 species. Both fish species use most submerged macrophytes as food when the latter are found in sufficiently high densities. However, some relatively abundant macrophytes (P. lucens, Batrachium circinatum) are not eaten. (Harris-Wisconsin)

GROWTH RESPONSES OF SELECTED FRESHWATER ALGAE TO TRACE ELEMENTS AND SCRUBBER ASH SLURRY GENERATED BY COAL-FIRED POWER PLANTS,
Iowa State Univ., Ames. Dept. of Botany.
R. W. Vocke, K. L. Sears, J. J. O'Toole, and R. B. Wildman.
Water Research, Vol 14, p 141-150, 1980. 8 Tab, 67 Ref.

Descriptors: *Aquatic algae, *Growth rates, *Industrial wastes, *Inhibition, Bioassay, Trace elements, Powerplants, Coals, Fossil fuels, Arsenic compounds, Cadmium, Mercury, Scenedesmus, Toxicity, *Coal powerplants, *Ash, *Arsenic, *Selenium.

In laboratory studies, the freshwater algae Ankistrodesmus falcatus, Scenedesmus obliquus, Selenastrum capricornutum, and Microcoleus vaginatus were exposed to potential pollutants from coal-fired power plants, and their growth responses were evaluated. Using a modification of the EPA Algal Assay Procedure Bottle Test, algae were incubated in media containing As(V) as Na2HAs04.7H20, Cd(II) as CdS04, Hg(II) as HgS04, Se(VI) as Na2Se04, in solution, and scrubber ash slurry generated at a western U.S. coal-fired power plant complex. First significant inhibition levels as well as algistatic-algicidal levels are reported. The median effective concentration (EC50) values for the potential pollutants ranged from 0.048-30.761 mg/l (0.00064-0.41058M) As(V), 0.005-0.019 mg/l (0.00004-0.00017 M) Cd(II), 0.033-0.253 mg/l (0.00016-0.00126 M) Hg(II), 0.033-8.511 mg/l (0.00042-0.10779 M) Se(VI), and 3.048-15.417% scrubber ash slurry extract (SASE). EFFECTS OF TRACE METALS ON GROWTH OF YELLOW PERCH (PERCA FLAVESCENS) AS MEASURED BY RNA-DNA RATIOS,
Purdue Univ., Lafayette, IN. Dept. of Bionucleonics.
P. K. Kearns, and G. J. Atchison.
Environmental Biology of Fish, Vol 4, No 4, p 383-387, 1979. 1 Fig, 1 Tab, 33 Ref.

Descriptors: *Toxicity, *Zinc, *Cadmium, *Yellow Perch, Growth rates, Fish physiology, Absorption, Seasonal, Growth stages, Heavy metals, Mode of action, Biochemistry, *DNA, *RNA.

Relationships between sublethal concentrations of cadmium and zinc in natural water and metal uptake by and growth of fish were investigated. RNA-DNA ratios and weight gain were used to assess seasonal growth differences between yellow perch populations from contaminated and control sites. Whole-body concentrations of cadmium and zinc in young-of-the-year perch were significantly different between sites. Measurable growth differences did occur and were significantly correlated with cadmium levels. Growth differences that were prominent during mid-summer were reduced by late summer. RNA-DNA ratios were sensitive indicators of fish growth. (Deal-EIS)

POPULATION STRUCTURE AND SPECIES COMPOSITION OF THE FREE-LIVING NEMATODES INHABITING SANDS OF THE NEW YORK BIGHT APEX,
City Coll., New York. Dept. of Biology.
J. H. Tietjen.
Estuarine and Coastal Marine Science, Vol 10, p 61-73, 1980. 3 Fig, 6 Tab, 23 Ref.

Descriptors: *Animal populations, *Nematodes, *Habitats, Spatial distribution, Bottom sediments, Heavy metals, Sands, Coarse sediments, Particle size, Chromium, Copper, Lead, Zinc, Municipal wastes, New York Bight, *Species diversity.

The free-living nematodes inhabiting silty and medium to coarse sands at nine stations in the New York Bight Apex were studied from August 1973 to September 1974. Average population densities ranged from 221 to 1381; no significant differences in density associated with sediment type, organic carbon or heavy metal concentrations were observed. In medium sands with low organic carbon and low heavy metal concentrations the nematode fauna was characterized by: (1) dominance by members of the families Chromadoridae and Desmodoridae; (2), low relative abundance of the family Comesomatidae; and (3), high species diversity. In silty sands, and also in medium sands with high organic carbon and/or high heavy metal concentrations, the fauna was marked by: (1) low relative abundances of the Chromadoridae and Desmodoridae; (2), high dominance of the Comesomatidae; and (3), low species diversity. In medium sands species diversity was significantly inversely correlated with increased concentrations of Cr, Cu, Pb and Zn. However, no such relationship existed in silty sands. Contaminated medium sands were also marked by high relative abundances of the comesomatid Sabatieria pulchra, which may be able to tolerate stressed sands much better than the normal inhabitants of such sediments; species belonging to the families Chromadoridae and Desmodoridae. (Deal-EIS)

SODIUM AND POTASSIUM IONS EFFECTS ON PHOSPHORUS TRANSPORT IN ALGAL CELLS,
EcolSciences Inc., South Bend, IN.
S. C. Mohleji, and F. H. Verhoff.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 110-125, 1980. 13 Fig, 1 Tab, 40 Ref.

Descriptors: *Aquatic algae, *Eutrophication, *Phosphorus, *Metabolism, Absorption, Sodium, Potassium, Ions, Membrane processes, Chemical reactions, Nutrients, Lakes, Cytological studies, Chlorophyta, Cyanophyta, *Selenastrum, *Microcystis.

Phosphorus is a substantive part of microbial biomass usually in stoichiometric limitation and thus is cited as the cause of eutrophication. However, microbial biomass is kinetic and not stoichiometric and thus any constituent that alters the rate of microbial nutrient uptake could alter the eutrophic state of a water body. This paper contains an investigation of the influence of sodium and potassium concentrations on phosphorus uptake in Selenastrum capricornutum and Microcystis aeruginosa. The phosphorus uptake rate by Selenastrum was found to be a function of time and of sodium and initial phosphorus concentrations. The P-uptake rate increased rapidly as Na+ increased from 0 to 4 mg/l, but slowly in the range 4 to 20 mg/l. K+ apparently decreased the P-uptake by Selenastrum. Compared to Selenastrum, Microcystis proved highly efficient in absorbing P and its absorption ability was not significantly affected by the presence of Na+ or K+. (Deal-EIS)

EFFECTS OF CHLOROBROMINATED AND CHLORINATED COOLING WATERS ON ESTUARINE ORGANISMS,
Academy of Natural Sciences of Philadelphia, Benedict, MD.
L. H. Liden, D. T. Burton, L. H. Bongers, and A. F. Holland.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 173-182, 1980. 5 Tab, 50 Ref.

Descriptors: *Cooling waters, *Chlorination, *Toxicity, *Estuarine environment, Halogens, Bromine, Food chains, Powerplants, Oysters, Clams, Mortality, Copepods, Bioassays, Respiration, Phytoplankton, Fish physiology, Atlantic Menhaden, *Spot, *Leiostomus.

Toxicities of chlorobrominated and chlorinated cooling waters to selected estuarine food-chain

organisms were investigated during an on-site power plant study. Survivals were similar among juvenile Atlantic menhaden (Brevoortia tyrannus) and spot (Leiostomus zanthurus) after exposures to BrCl- and Cl2-treated condenser effluents, Juvenile American oysters (Crassostrea virginica) and brackish water clams (Rangia cuneata) had no halogen-atributable mortalities after 15-day exposures. Similar survival reductions were recorded for copepods (Acartia tonsa) subjected to BrCl or Cl2 residuals (<0.100 mg/l) for 24 hours. Eductions in oxygen evolution (77 to 388%) and carbon-fixation (40 to 71%) rates and increased respiration rates (56 to 1,276%) of entrained phytoplankton were recorded from both chlorobrominated and chlorinated samples. BrCl and Cl2 residuals thus appear to have similar toxicities to estuarine organisms. (Deal-EIS)

DEVELOPMENT AND SURVIVAL OF EMBRYOS OF LAKE HERRING AT DIFFERENT CONSTANT OXYGEN CONCENTRATIONS AND TEMPERATURES,
National Marine Fisheries Service, Ann Arbor, MI. Great Lakes Fishery Lab.
L. T. Brooke, and P. J. Colby.
The Progressive Fish-Culturist, Vol 42, No 1, p 3-9, 1980. 1 Fig, 5 Tab, 14 Ref.

Descriptors: *Herrings, *Water temperature, *Dissolved oxygen, *Toxicity, Water chemistry, Growth rates, Mortality, Habitats, Hatching, Fry, Embryonic growth stage, Fish physiology, Freshwater fish, Lake Herring, Coregonus.

Eggs of lake herring (Coregonus artedii) were incubated in a continuous-flow system at four constant water temperatures (2-8C) and five dissolved oxygen (DO) concentrations (1-12 mg/l). In comparison with incubation time at 12 mg/l DO, time to median hatch was significantly longer at 2 mg/l at 6C (no hatch at 1 mg/l), at 3 mg/l or less at 4C, and at 4 mg/l or less at 2C. The time between hatching of the first and last eggs varied inversely with temperature. Mean total lengths of newly hatched fry were significantly shortened at 1 and 2 mg/l DO. At 6 and 8C, percent survival through hatching was greater than at 2 and 4C at DO of 4 mg/l or more, but fell to zero at 1 mg/l. The percentage of normal fry produced decreased noticeably below 4 mg/l DO. The optimum temperature for highest percentage survival of normal fry decreased directly with the level of dissolved oxygen. The temperatures at which the highest percentages of normal fry hatched from eggs incubated at DO concentrations of 4 or 8, 2, and 1 mg/l, were 6, 4, and 2C, respectively-indicating a decreasing DO demand by embryos incubated at the lower temperatures. Our findings supported a previously published hypothesis that DO concentrations below 4 mg/l can be adverse to survival and development of coregonid embryos in nature. (Deal-EIS)

A COMPARISON OF THE ACUTE TOXICITIES OF TEN HEAVY METALS TO PHYTOPLANKTON FROM SAANICH INLET, B.C., CANADA,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
J. T. Hollibaugh, D. L. R. Seibert, and W. H. Thomas.
Estuarine and Coastal Marine Science, Vol 10, p 93-105, 1980. 5 Fig, 2 Tab, 49 Ref.

Descriptors: *Heavy metals, *Toxicity, *Phytoplankton, Copper, Mercury, Lead, Cadmium, Zinc, Nickel, Chromium, Bioassay, Inhibition, Growth rates, Aquatic algae, *Selenium, *Arsenic, *Antimony, *Thalassiosira.

The acute toxicities of Cu, Hg, Pb, Cd, Zn, Ni, Cr, Se, Sb, and As to Saanich Inlet phytoplankton were determined in enrichment culture bioassays. The toxicity of ions of a single metal to natural assemblages of phytoplankton enriched with nitrate, phosphate, and silicate was assessed by measuring the inhibition of plant growth. Toxicity to Thalassiosira aestevalis isolated from a June phytoplankton population was determined in a medium made of glass-fiber filtered Saanich Inlet seawater enriched with nitrate phosphate, and silicate. The concentration of a metal causing inhibition of growth under these conditions ranged from about 30 nannoM Hg to >1000 nannoM, Se, Sb, Cr, and Ni. The growth-inhibiting concentration of a given metal was similar to both natural populations and the Thalassiosira culture. Shifts in the species composition relative to controls were observed when natural assemblages were exposed to toxic levels of metals. (Deal-EIS)

DIEL PATTERNS OF PHYTOPLANKTON PRODUCTIVITY AND EXTRACELLULAR RELEASE IN ULTRA-OLIGOTROPHIC LAKE TAHOE,
California Univ., Davis. Div. of Environmental Studies.
M. M. Tilzer, and A. J. Horne.
Internationale Revue der gesamten Hydrobiologie, Vol 64, No 2, p 157-176, 1979. 8 Fig, 6 Tab, 55 Ref. NSF-RANN GI-22 and ERS 74-22675.

Descriptors: *Lake Tahoe(CA-NV), *Diel migration, *Phytoplankton, *Biorhythms, Oligotrophy, Diatoms, Chrysophyta, Primary productivity, Photosynthesis, Thermal stratification, Mixing, Cytological studies, Vertical migration, California, Nevada.

Lake Tahoe, California, phytoplankton is dominated by diatoms and chrysophytes. Mixing and thermal stratification are the main factors influencing seasonal productivity. Due to a relatively small (1.6 times the lake area) infertile watershed, the average annual primary production rates of the entire trophogenic zone are 0.5-0.6 g C/cu m. Between April and September 1975 a series of measurements was taken at the lake in order to assess the diel periodicity of phytoplankton photosynthesis and of environmental factors that relate to algae. Photosynthesis in shallow waters is light-inhibited throughout the day. Photosynthetic rates per unit chlorophyll-a, shows consistent relationship to subsurface light within single 24-hour periods, but varies between dates of experiments. Photosynthesis in mixed water columns is depressed in the afternoon due to a reduction in the photosynthetic potential of algae. Since extracellular release averages between 7.8 and 17.2% of total production rates and shows little vertical differentiation, damage of algal cells by light can be excluded. Overnight respiratory losses comprises at least 30% of the carbon assimilated during the preceding day. Integral photosynthesis shows a logarithmic correlation with incident light. This correlation can be used to predict daily production rates from mid-day incubation with an error of less than 10%. (Harris-Wisconsin)

THE PROCESS OF FISH FAUNA RESTORATION IN THE RIVER PEK FOLLOWING THE CATASTROPHIC OUTBREAK OF GANGUE FROM THE COPPER MINES 'MAJDANPEK' IN YUGOSLAVIA,
Institute for Biological Research, Belgrade (Yugoslavia).
D. Jankovic.
Symposia Biologica Hungarica, Vol 19, p 141-149, 1979. 5 Fig, 2 Tab, 7 Ref.

Descriptors: *Mine wastes, *Toxicity, *Biological communities, *Rivers, Copper, Heavy metals, Spoil banks, Chemical wastes, Waste dumps, Fish migrations, Aquatic populations, Fish populations, Bioindicators, Growth rates, *Yugoslavia, River Pek, Sediments.

As a consequence of repeated tectonic disturbances, a breach of the ore gangue of a copper mine occurred in Serbia in January 1974. The ore gangue was discharged together with water into the River Pek (Danube area) destroying its entire ichthyofauna. Studies conducted for four years showed the process of river restoration and the gradual recovery of fishes immigrating from the unpolluted upper river sections, its tributaries and the river danube. Living conditions have been studied following the catastrophe observing the growth of fishes as well as the pollution of the river by saprobity indicators. (Deal-EIS)

EFFECT OF CERTAIN ORGANOCHLOR INSECTICIDES ON PRIMARY PRODUCTION IN A FRESHWATER POND,
North-Eastern Hill Univ., Shillong (India). Dept. of Zoology.
S. A. K. Nasar.
Progress in Water Technology, Vol 11, No 6, p 247-251, 1979. 1 Tab, 23 Ref.

Descriptors: *Pesticide toxicity, *Primary productivity, *Phytoplankton, Chlorinated hydrocarbon pesticides, Aldrin, Dieldrin, Endrin, Inhibition, Photosynthesis, Mode of action, Insecticides.

Experiments were conducted to assess the effects and degree of toxicity of certain widely used organochlor insecticides i.e. Aldrin, Dieldrin and Endrin, on primary production of phytoplankton. The insecticides Aldrin, Dieldrin and Endrin showed a retardation of primary production in phytoplankton of 37.9%, 25.0% and 14.8% over control at 0.5 ppm, 0.01 ppm and 1.0 ppm respectively. The primary production was found to be nil at 1.0 ppm, 0.1 ppm and 1.5 ppm concentration of Aldrin, Dieldrin and Endrin respectively. The results of the present investigation thus sound a note of warning that the insecticides should be used carefully in the field, keeping in mind high toxicity, inhibiting phytosynthesis effect and harmful cumulative effect on the primary productivity of the adjacent water bodies. INFLUENCE OF THERMAL CHALLENGE ON CONDITIONED FEEDING FORAYS OF JUVENILE RAINBOW TROUT,
Environmental Research Lab.-Duluth, MN.
B. H. Munson, J. H. McCormick, and H. L. Collins.
Transactions of the American Fisheries Society, Vol 109, p 116-121, 1980. 3 Fig, 15 Ref.

Descriptors: *Fish behavior, *Toxicity, *Water temperature, *Rainbow trout, Juvenile growth stage, Heated water, Thermal stress, Heat resistance, Mortality, Laboratory tests, *Acclimation.

Juvenile rainbow trout (Salmo gairdneri) conditioned to traverse a 2.4 m-long channel to receive a food reward were subjected to in-transit thermal challenges. Conditioning was to a criterion that required 80% of the fish to leave the 'home' area and reach the 'reward' area within 2 minutes of release. Challenges were at successive 3C increments above acclimation or the previous challenge temperature. Fish were first observed to delay their entrance into the intervening heated water at challenge temperatures of 12-15C above acclimation. At each increment above 12-15C over acclimation temperature, delay in transit increased: however, complete group inhibition was never achieved. Above their critical thermal maximum (CTM) the reward was achieved even at the expense of deaths among the achievers. Responses were the same whether fish were challenged individually or as groups. Fish exposed to their CTM without prior challenges at less stressful temperatures responded similarly to those receiving progressively greater challenges. (Deal-EIS)

MASSIVE FISH MORTALITIES CAUSED BY ALGAL BLOOMS IN EUTROPHIC ECOSYSTEMS,
Department of Fisheries and Oceans, Winnipeg (Manitoba). Freshwater Inst.
J. Barica.
Symposia Biologica Hungarica, Vol 19, p 121-124, 1979. 1 Fig, 13 Ref.

Descriptors: *Eutrophication, *Fishkill, *Seasonal, Cyanophyta, Nutrients, Ammonia, Dissolved oxygen, Oxygen requirements, Growth rates, Rainbow trout, Trophic level, Canada, Blue green algae.

Development of noxious Cyanophyte blooms from high inputs of nutrients, their rapid die-off and lysis result in massive fish mortalities from oxygen depletion and high ammonia levels (summerkill). This phenomenon, representing the ultimate stage of the eutrophication process, causes seasonal large-scale catastrophes in the fisheries of many countries of the temperate and warm climatic zones. Findings of limnological research on Canadian prairie lakes over 1971-1977 are summarized with particular reference to the mechanism, ecological impact, prediction and prevention of the phenomnon. THE INFLUENCE OF SALINITY ON BEHAVIOUR AND OXYGEN UPTAKE OF THE HERMIT CRAB PAGURUS BERNHARDUS L.,
University Coll. of North Wales, Bangor. Marine Science Labs.
J. Davenport, P. M. C. F. Busschots, and D. F. Cawthorne.
Journal of the Marine Biological Association of the United Kingdom, Vol 60, p 127-134, 1980. 3 Fig, 1 Tab, 10 Ref.

Descriptors: *Crabs, *Salinity, *Oxygen requirements, Animal physiology, Animal metabolism, Toxicity, Water chemistry, Animal behavior, Habitats, Adaptation, Dissolved oxygen, *Pagurus, *Hermit crab, *Acclimation.

A survey of tidal pools on the shore of the Menai Strait showed that hermit crabs are largely confined to water of 25 o/ooS or more. Experiments showed that specimens of Pagurus bernhardus retreated into their shells when environmental salinity levels fell to 20.5-22.5 o/ooS. This critical range was independent of rate of salinity change. However, acclimation to water of 23.1 o/ooS for more than 2 weeks lowered this behavioural threshold to 15.5 o/ooS. In respirometric experiments, hermit crabs were found to be 'oxygen conformers' since oxygen consumption fell with declining oxygen tension, especially below 30% air saturation. Crabs which had retreated into their shells in water of 16.5 o/oo or less showed negligible oxygen uptake whereas those which had retreated whilst in full seawater showed substantial oxygen consumption. These observations suggest that hermit crabs not only retreat into their shells at low salinity, but also cease ventilating their branchial chambers. Pagurus was found to survive in oxygen free sea water for 7 h, yet survived in fresh water for less than 3 h. This suggests that the withdrawn hermit crab succumbs to haemolymph dilution rather than to oxygen lack at low salinities. (Deal-EIS)

DISTRIBUTION, ABUNDANCE, COMMUNITY STRUCTURE, AND TROPHIC RELATIONSHIPS OF THE BENTHIC INFAUNA OF THE NORTHEAST GULF OF ALASKA,
Alaska Univ., Fairbanks. Inst. of Marine Science.
H. M. Feder, and G. E. M. Matheke.
In: Environmental Assessment of the Alaskan Continental Shelf, Final Reports of Principal Investigators. Vol 6: Biological Studies, p 1-256, December 1979. 19 Fig, 33 Tab, 99 Ref, 5 Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Oil pollution, *Benthos, *Ecosystems, *Baseline studies, *Water pollution effects, Alaska, Resources development, Environmental effects, *Outer Continental Shelf, Northern Gulf of Alaska(NEGOA), Trophic interactions, Petroleum development.

The objectives of this study were: (1) a qualitative and quantitative inventory of benthic species within and adjacent to identified oil-lease sites in the northeast Gulf of Alaska (NEGOA), (2) a description of spatial and temporal distribution patterns of selected species in the designated study area, and (3) observations of biological interrelationships, specifically trophic interactions, between components of the benthic biota. Basic information on diversity of the fauna is available. Diversity appears to increase in areas where the sedimentation rate is reduced and the presence of sand and gravel substrates increase environmental heterogeneity. Numerical analysis of the benthic infauna delineated four major site groups. One of these site groups, the Inshore Group, consisted of sites with predominantly silt-clay sediments located on the continental shelf. Its fauna was dominated by deposit-feeding species which were also present at all other sites. An example is given on a diesel fuel spill resulting in oil becoming adsorbed on sediment particles with resultant mortality of many deposit feeders on sub-littoral muds. Bottom stability was altered with the death of these organisms, and a new complex of species became established in the altered substratum. It is suggested that oil-related mortality of deposit feeders could result in a changed near-bottom sedimentary regime with subsequent alteration of species composition. Development of monitoring programs based on species composition at selected sites is recommended. (Sinha-OEIS)

BASELINE STUDIES OF FISH AND SHELLFISH RESOURCES OF NORTON SOUND AND THE SOUTHEASTERN CHUKCHI SEA,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
R. J. Wolotira, Jr., T. M. Sample, and M. Morin, Jr.
In: Environmental Assessment of the Alaskan Continental Shelf. Final Reports of Principal Investigators. Vol 6: Biological Studies, p 258-572, December 1979. 139 Fig, 87 Tab, 36 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Fish, *Shellfish, *Baseline studies, *Resources development, *Environmental effects, Oil pollution, Water pollution effects, Alaska, Distribution, *Outer Continental Shelf, Norton Sound, Chukchi Sea, Ecological distribution, Petroleum development.

Findings from an intensive six-week survey (September-October, 1976) of fish and shellfish fauna in Norton Sound, the southeastern Chukchi Sea, and adjacent waters are presented and a brief review of other pertinent information on the survey region is discussed. Results of the survey defined the distribution and centers of abundance of several fish, crab, and snail species within the survey region and period. In addition, standing stock estimates and species composition of demersal fauna by geographic subdivisions of the survey region were determined. Analyses of species associations show recurrent groupings of certain species and their regional distributions. Estimates of biological characteristics, including size and age composition, length-weight relationships, and growth characteristics are provided for dominant fish species and for several species of crabs and snails. Most species studied are found in highest relative abundance in shallow, warm-water regions and greatest density occurs in Norton Sound. Growth of most fish appears greatest in areas studied south of Bering Strait. Almost no fish species were encountered in either sufficient size or quantity to be considered as potential for commercial harvest. (Sinha-OEIS)

TROPHIC RELATIONSHIPS AMONG ICE INHABITING PHOCID SEALS AND FUNCTIONALLY RELATED MARINE MAMMALS,
Alaska Dept. of Fish and Game, Fairbanks.
L. F. Lowry, K. J. Frost, and J. J. Burns.
In: Environmental Assessment of the Alaskan Continental Shelf. Final Reports of Principal Investigators. Vol 6: Biological Studies, p 573-629, December 1979. 14 Fig, 8 Tab, 72 Ref, Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Mammals, *Oil pollution, *Baseline studies, *Environmental effects, *Water pollution effects, Resources development, Ecosystems, Alaska, *Outer Continental Shelf, Beaufort Sea, Trophic relationships, Prey.

The trophic relationships of Beaufort Sea marine mammals, primarily ice-inhabiting seals, have been investigated since 1975. This report is an effort to synthesize the information collected since that time and make it available to resource managers for consideration during Environmental Impact Statement preparation and policy formulation. The main objective has been to develop an understanding of the trophic relationships of marine mammals and to assess the potential effects on marine mammals of changes in the trophic structure of the Beaufort Sea which may result from OCS exploration and development. Not only is it important to know the direct effects of hydrocarbons on critical prey species, but it is also necessary to evaluate temporal variations in prey sensitivity, critical times or areas for particular prey species and critical feeding periods for predator species. Pollutant levels high enough to cause large-scale die-offs of individuals will probably occur only on a very localized basis (except where oil or pollutants are trapped under the ice and transported long distances in a relatively unweathered state). The greatest concern may be with long-term sublethal low concentrations of pollutants which may affect locomotion, metabolism or reproduction and lead to substantial reduction of populations over several generations. These long-term reductions are of special concern in considering food availability to consumers. (Sinha-OEIS)
W80-04423

DEMERSAL FISH AND SHELLFISH ASSESSMENT IN SELECTED ESTUARY SYSTEMS OF KODIAK ISLAND,
Alaska Dept. of Fish and Game, Kodiak.
J. E. Blackburn.
In: Environmental Assessment of the Alaskan Continental Shelf. Final Reports of Principal Investigators. Vol 6: Biological Studies, p 727-852, December 1979. 7 Fig, 14 Tab, 21 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Fish, *Shellfish, *Fisheries, *Estuaries, *Oil pollution, Water pollution effects, Environmental effects, Baseline studies, Resources development, Alaska, *Outer Continental Shelf, Kodiak Island, Petroleum development, Demersal epifauna.

This study was designed to sample virtually all the habitats within Ugak, Kaiugnak and Alitak bays but principally it was addressed to the demersal epifauna that are vulnerable to capture by otter trawl, specifically, fish and crustacean shellfish. The demersal community is an important segment of the marine community in the Kodiak lease area. It is highly productive, supports a number of valuable fisheries and most of the species of this community have pelagic stages in their life history which would place them in a wide variety of habitats at different times during the year. The larval and early juvenile stages of many species are found in the near surface and nearshore zones where, it would seem, oil development impact would be most severe. Targeting studies upon these probably susceptible stages to the exclusion of other life history stages would be inappropriate. Similarly a premature decision as to which habitats (demersal or pelagic - nearshore) would be most susceptible to oil development impact would be inappropriate. The inescapable conclusion is that knowledge of the demersal community is very important to the process of locating sensitive areas and sensitive taxa. This study broadens the base of knowledge of the demersal community in the two bays, Ugak and Alitak. (Sinha-OEIS)
W80-04425

OIL SPILL VULNERABILITY, COASTAL MORPHOLOGY, AND SEDIMENTATION OF THE KODIAK ARCHIPELAGO,
South Carolina Univ., Columbia. Coastal Research Div.
M. O. Hayes, and C. H. Ruby.
In: Environmental Assessment of the Alaskan Continental Shelf. Final Reports of Principal Investigators. Vol 2: Physical Science Studies, p 1-155, December 1979. 32 Fig, 3 Tab, 54 Ref, 4 Append, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Oil spills, *Baseline studies, *Water pollution effects, *Morphology, Alaska, Sediment transport, Coasts, Environmental effects, Resources development, Cold regions, *Outer Continental Shelf, Kodiak Island, Oil Spill Vulnerability Index.

The Oil Spill Vulnerability Index, as it applies to the Kodiak Archipelago is presented. It is based partly on the longevity of potential oil spills within each of the subenvironments. Forty-seven base maps are listed and under each base map, the 10 subclasses of the Oil Spill Vulnerability Index are listed with the number of shoreline kilometers falling into each class for that base map. Using the vulnerability classification, it is possible to make a few generalizations regarding the Kodiak area and its reaction to potential oil spills. In general, the area is quite high risk. Unfortunately, the Kodiak system is very complex and the higher risk areas do not lend themselves well to being protected during a spill. In many instances, a low risk rock scarp will lie just seaward of a large embayment with high risk pure gravel beaches. The indented (fjord) character of the islands will act as 'oil traps' for floating oil. Oil will tend to be moved deeper into the fjords rather than to be flushed out. In general this will result in an oiling of increasingly sensitive environments, since higher risk, lower energy classes are located deeper in fjords and embayments. Additionally, there are long periods of relatively low wind and wave energy, especially during the summer. A spill during one of these periods could prove particularly devastating. (Sinha-OEIS)
W80-04426

DYNAMICS OF NEAR SHORE ICE,
Washington Univ., Seattle. Polar Science Center.
R. Colony.
In: Environmental Assessment of the Alaskan Continental Shelf. Final Reports of Principal Investigators. Vol 2: Physical Science Studies, p 156-180, December 1979. 5 Fig, Append, NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Oil spills, *Ice, *Baseline studies, *Water pollution effects, Alaska, Environmental effects, Resources development, Cold regions, *Outer Continental Shelf, *Pack ice, Beaufort Sea, Chukchi Sea, Petroleum development, Nearshore.

The near shore pack ice of the Beaufort Sea and Chukchi Sea have a profound influence on the development of the gas and oil fields of Northern Alaska. Design of structures, security of sub-surface pipelines, and surface transport of oil is dependent on a knowledge of many of the properties of the near shore pack ice. Observations of ice motions are relevant for three borad reasons: the ice cover serves as a carrier of any petroleum products spilled in the Beaufort or Chukchi Sea so that the ice trajectories serve as a first estimate of the paths to be taken by the oil; the observations identify the important physical processes at work within the ice pack; and the ice motion is an observable quantity that is compared with a simulation of pack ice dynamics. The current study shows the near shore ice pack between Pt. Barrow and Cape Lisburne to move into the central Chukchi Sea during early summer and then to move north and west; probably to be incorporated into the transpolar drift stream. Once the ice moved toward the central Chukchi the mean motion was very similar to the drift of the summer of 1977. (Sinha-OEIS)
W80-04427

SEDIMENTOLOGY AND GEOCHEMISTRY OF SURFACE SEDIMENTS AND THE DISTRIBUTION OF FAULTS AND POTENTIALLY UNSTABLE SEDIMENTS, ST. GEORGE BASIN REGION OF THE OUTER CONTINENTAL SHELF, SOUTHERN BERING SEA,
Geological Survey, Menlo Park, CA.
J. V. Gardner, T. L. Vallier, W. E. Dean, K. Kvenvolden, and G. D. Redden.
In: Environmental Assessment of the Alaskan Continental Shelf. Final Reports of Principal Investigators. Vol 2: Physical Science Studies, p 181-271, December 1979. 35 Fig, 14 Tab, 66 Ref, Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Seismology, *Geology, *Hazards, Alaska, Sediments, Geochemistry, Resources development, Baseline studies, *Outer Continental Shelf, Bering Sea, St. George Basin.

The data and interpretations from studies of surface sediments, faults, and areas of potentially unstable sediment masses in the St. George Basin region of the outer continental shelf, southern Bering Sea are summarized. The report is divided into four major parts: Part 1 is an introduction which reviews methods used and the quantity of data collected during the contract period; Part 2 deals with the sedimentology and geochemistry of surface sediments; Part 3 discusses distributions of faults and areas of potentially unstable sediment; and Part 4 is a review of the major conclusions. Major faults are principally distributed along or near the borders of St. George basin and they trend parallel to the basin's long axis. Minor faults are widely distributed throughout the middle of St. George basin. Major faults are probably related to stress fields established by Mesozoic and Cenozoic plate motions and minor faults are related to high seismicity in the nearby Aleutian subduction zone. W80-04428

COASTAL PROCESSES AND MORPHOLOGY OF THE BERING SEA COAST OF ALASKA,
Geological Survey, Menlo Park, CA.
A. H. Sallenger, Jr., and J. R. Dingler.
In: Environmental Assessment of the Alaskan Continental Shelf. Final Reports of Principal Investigators. Vol 2: Physical Science Studies, p 377-441, December 1979. 29 Fig, 3 Tab, 16 Ref. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Morphology, *Geology, *Storms, *Hazards, *Baseline studies, Alaska, Resources development, Coasts, Paths of pollutants, Water pollution, Environmental effects, *Outer Continental Shelf, Bering Sea, Petroleum development, Coastal development set-back line.

The regional characterization of the physical environment of the Bering Sea coast of Alaska included determination of net longshore transport directions, characterization of coastal morphology, and reconnaissance of beach morphology and sediment characteristics. These types of studies were extended to Pavlov Bay and Cold Bay on the Pacific coast of the Alaska Peninsula. These potential deep water ports may serve offshore petroleum exploitation of the Bristol Bay area in the future. Results of these studies are used to obtain qualitative assessment of coastal stability, in preparing preliminary siting studies for coastal developments, and in the determination of the long-term directions of transport of particulate pollutants in the littoral system. Shallow offshore depths that characterize much of

the eastern Bering Sea shelf make coastal areas susceptible to storm surges of large magnitude. Potential consequences of storms in this environment pose hazards to coastal developments in addition to hazards resulting from flooding and wave activity alone. One use for this kind of data is to establish a coastal development set-back line. Developments within areas subject to inundation by storm surge or undermining by coastal erosion would be prohibited. Additional input into this analysis must include the long-term rate of erosion. For structures that must cross the coastline (e.g. pipelines) the maximum scour depth must be established for both storms and over the long-term. (Sinha-OEIS)

OIL SPILL TRAJECTORY ANALYSIS LOWER COOK INLET, ALASKA,
Dames and Moore, Los Angeles, CA.
R. Schlueter.
In: Environmental Assessment of the Alaskan Continental Shelf. Final Reports of Principal Investigators. Vol 2: Physical Science Studies, p 442-745, December 1979. 19 Fig, 8 Tab, 22 Ref, 4 Append. NOAA, Environmental Research Laboratories, Outer Continental Shelf Environmental Assessment Program, Boulder, Colorado.

Descriptors: *Oil spills, *Model studies, *Baseline studies, *Water pollution effects, Alaska, Currents(Water), Wind velocity, Resourced development, Environmental effects, *Outer Continental Shelf, *Trajectories, Petroleum development, Cook inlet.

In continuing studies of the behavior of spilled oil in Lower Cook Inlet, behavior of a surface oil slick was represented by the trajectory of the centroid of the slick neglecting mass-dependent phenomena such as spreading, evaporation, sinking, etc. The velocity of the centroid was modeled as the linear, vectorial addition of wind velocity coupled to centroidal velocity by a coefficient of 3% and the total surface current velocity. A Dames & Moore oil spill numerical model embodying these concepts was used to carry out the analyses. The results of this project include not only the predicted oil spill behavior, but also the input wind and current fields. The fields developed represent the most recent synthesis of current measurement and modeling results available in October 1978. An overview of the oil spill model is given which provides the general framework of the analytic approach used to determine shoreline exposure due to postulated oil spills at selected sites. Details of the model, details of the environmental input data and a discussion of the methodology and results of the trajectory simulations are also presented. (Sinha-OEIS)

THE EFFECTS OF LOW LEVELS OF OIL ON AQUATIC BIRDS. A NON-TECHNICAL SUMMARY OF RESEARCH ACTIVITIES FY76 THROUGH FY78,
College of the Atlantic, Bar Harbor, ME.
J. O. Biderman, and W. H. Drury.
US Fish and Wildlife Service Biological Services Program Report No FWS/OBS-80-16, March 1980. 5 p, 1 Ref, Conducted in Cooperation with US Environmental Protection Agency.

Descriptors: *Birds, *Water pollution effects, *Oil pollution, Reproduction, Resources development, Environmental effects, *Outer Continental Shelf, Aquatic birds.

The reproductive period, including the time of growth and development of the young, is a highly sensitive time for any animal when physiological systems are acting at critical rates. Any slight interference, such as the addition of a stressful or toxic agent is likely to be disastrous. It has been demonstrated that exposure of adult waterbirds or their developing young to slight amounts of petroleum can seriously interfere with the reproductive process. Effects can range from interference with the physiology of reproduction to killing of embryos, production of developmental defects, stunting of growth and impairment of survival ability when birds are stressed. Oil can be taken up by adults in their food or picked up on their feathers, and can be transferred to eggs or nestlings. Managers should be conscious of these effects, which though less apparent in nature, may in fact be more serious than the infrequent kill-offs occurring after catastrophic spills. For it may well turn out that a chronic reduction in reproductive success may be the most significant effect of oil pollution on populations of aquatic birds. (Sinha-OEIS)

ENVIRONMENTAL ASSESSMENT OF AN ACTIVE OIL FIELD IN THE NORTHWESTERN GULF OF MEXICO 1977-1978. VOLUME I - SYNOPSIS.
National Marine Fisheries Service, Galveston, TX. Southeast Fisheries Center.
Annual Report to the Environmental Protection Agency on work conducted under provisions of the Interagency Agreement during 1977-1978, June 1979. 78 p, 3 Fig, 1 Tab. EPA-IAG-05-E693-EO.

Descriptors: *Oil pollution, *Oil fields, *Water pollution effects, *Environmental effects, Gulf of Mexico, Resources development, Ecosystems, Projects, *Outer Continental Shelf, Environmental assessment, Buccaneer Oil Field.

Volume I - Synopsis is the first of three volumes in an annual report. It is designed to be used as a briefing document and as a key to more detailed scientific and technical information contained in the other volumes. The area selected for study is the operational Buccaneer Oil Field located approximately 49.6 km from Galveston Sea Buoy off Galveston, Texas. Objectives of the project are: (1) to identify and document the types and extent of biological, chemical and physical alterations of the marine ecosystem associated with Buccaneer Oil Field, (2) to determine specific pollutants, their quantity and effects, and (3) to develop the capability to describe and predict fate and effects of Buccaneer Oil Field contaminants. The Buccaneer Field has been in production for about 15 years thus allowing for the full development of oil-field-associated marine communities. There have been no major oil spills from this field although there have undoubtedly been losses of small amounts of oil. This project provides a unique opportunity for continued study of effects of chronic, low-level contamination of the marine ecosystem associated with oil and gas production in an established field. SLUDGE DUMPING: MEETING THE 1981 DEADLINE,
Environmental Protection Agency, New York.
R. T. Dewling, and P. W. Anderson.
In: Marine Technology/79 'Ocean Energy', Proceedings of 15th Annual Conference sponsored by the Marine Technology Society, held New Orleans, Louisiana, October 10-12, 1979. p 34-39, 1979. 3 Fig, 1 Tab. MTS, Washington, D.C.

Descriptors: *Waste disposal, *Sewage sludge, Environmental effects, Water pollution effects, *Outer Continental Shelf, *Ocean dumping, New York Bight.

The Marine Protection, Research and Santuaries Act of 1972 mandates that EPA 'prevent or strictly regulate' the dumping of waste materials into the ocean. The Act was amended in November 1977 to prohibit the dumping of harmful sewage sludge in the ocean after December 31, 1981. Scientific investigations, mainly by NOAA, have documented several adverse environmental impacts at the sludge and dredged material sites. These impacts include elevated concentration of heavy metals, organic matter, and bacterial in the water and bottom sediments with attendant threat of bioaccumulation in the food chain; reduced catches of bony fish in high-carbon sediment areas; FDA closure of extensive areas to shellfishing; enrichment resulting in increased phytoplankton productivity, the occurence of finrot, exoskeleton erosion, and gill clogging in certain marine life; and sediments in the vicinity of the dump sites devoid of normal benthic biological communities. The Congressional mandate has spurred sewage sludge generators to develop and implement alternate disposal methods. All options available have associated environmental risks since metropolitan area sludges contain pathogens, toxic metals, and persistent synthetic organic materials. No matter what method is chosen--landfill, incineration, pyrolysis, composting or recycling, some environmental impact will result. (Sinha-OEIS)

SEAFLOOR SAND MINING IN JAPAN,
National Research Inst. for Pollution and Resources, Tokyo (Japan).
T. Usami, K. Tsurusaki, T. Hirota, and J. W. Padan.
In: Marine Technology/79, 'Ocean Energy', Proceedings of 15th Annual Conference sponsored by the Marine Technology Society, held New Orleans, Louisiana, October 10-12, 1979. p 176-189, 1979. 14 Fig, 3 Tab, 5 Ref. MTS, Washington, D.C.

Descriptors: *Mining, *Resources development, Environmental effects, Erosion, *Outer Continental Shelf, *Offshore mining, Japan.

Rapid depletion of onshore deposits of construction aggregate has caused Japan to tap sand deposits in coastal waters. In recent years offshore mining has contributed 15 to 20% of total production of natural aggregate and about 10% of all aggregate used in Japan. Annual production is 60 to 70 million tons and is expected to increase. This paper describes the role of seafloor sand mining in Japanese industry as well as problems facing the expansion of the industry. Three problems which must be overcome are: the deeper water deposits located by the Geological Survey of Japan must be evaluated; technology to mine as deep as 300 meters, economically, must be developed; and finally, the environmental effects must be held to a minimum. Research will continue to focus on coastal erosion and turbidity effects as the main concerns. (Sinha-OEIS)

ENVIRONMENTAL CONCERNS FOR OTEC IDENTIFIED IN THE DOE OTEC ENVIRONMENTAL READINESS DOCUMENT,
California Univ., Berkeley. Lawrence Berkeley Lab.
K. F. Haven.
In: Marine Technology/79, 'Ocean Energy', Proceedings of 15th Annual Conference sponsored by the Marine Technology Society, held New Orleans, Louisiana, October 10-12, 1979. p 326-330, 1979. 1 Tab. MTS, Washington, D.C.

Descriptors: *Environmental effects, *Hazards, *Energy conversion, *Resources development, Thermal pollution, Water pollution effects, Entrainment, Ecology, *Outer Continental Shelf, Ocean Thermal Energy Conversion(OTEC).

The findings and significance of the Department of Energy Environmental Readiness Document (ERD) for OTEC is presented. An ERD is prepared periodically for emerging energy technologies by the DOE Assistant Secretary for Environment and represents an analytical statement of DOE's environmental concerns with the technology. The ERD discusses the current status of knowledge for each concern, the time frame for potential realization of the concern, and the approximate magnitude of the environmental insult which could be realized. Nine environmental concerns are identified for OTEC in the ERD. Six of the nine concerns represent known environmental hazards, yet additional environmental research will be required for each in order to determine both their magnitude and their significance in the open ocean marine environment. 1979 STATUS OF THE OTEC ENVIRONMENT PROGRAM,
California Univ., Berkeley. Lawrence Berkeley Lab.
P. Wilde.

In: Marine Technology/79, 'Ocean Energy', Proceedings of 15th Annual Conference sponsored by the Marine Technology Society, held New Orleans, Louisiana, October 10-12, 1979. p 340-345, 1979. 1 Fig, 3 Tab, 9 Ref. MTS, Washington, D.C.

Descriptors: *Water pollution effects, *Energy conversion, *Baseline studies, *Resources development, Thermal pollution, Chemical potential, Gulf of Mexico, Hawaii, Puerto Rico, *Outer Continental Shelf, Ocean Thermal Energy Conversion(OTEC), Ocean properties.

Preliminary surveys and laboratory studies are being conducted in the waters of Puerto Rico, The Gulf of Mexico, and Hawaii for moored or seacoast OTEC plants and in the equatorial South Atlantic for plant-ship operations to provide baseline data. These data plus existing archival information can be used to model effects of OTEC operations. Four major areas of concerns (1) redistribution of oceanic properties, (2) chemical pollution, (3) structural effects, and (4) socio-legal-economic; and 11 key issues associated with OTEC operation have been identified. Mitigating strategies can be used to alleviate many deleterious environmental effects of operational problems as biostimulation, outgassing, etc. Various assessment research studies on toxicity, biocide releases, etc., are under way to investigate areas where no clear mitigating strategy is available. Data from these programs is being integrated into a series of environmental compliance documents including a programmatic environmental impact assessment. (Sinha-OEIS)

COASTAL FRONTAL SYSTEMS AS A POLLUTANT CONTROL MECHANISM FOR OFFSHORE ENERGY PRODUCTION,
Science Applications, Inc., Bryan, TX. Ocean Science Div.
J. K. Lewisk.
In: Marine Technology 79, 'Ocean Energy', Proceedings of 15th Annual Conference sponsored by the Marine Technology Society, held New Orleans, Louisiana, October 10-12, 1979. p 389-396, 1979. 3 Fig, 3 Tab, 9 Ref. MTS, Washington, D.C.

Descriptors: *Environmental effects, *Oil pollution, *Oil spills, *Resources development, Water pollution control, Texas, Dispersion, Wind, *Outer Continental Shelf, Oil and gas production, Coastal frontal system.

A surface core of fresher water from the Mississippi Delta region is advected along the Texas coast due to longshore wind stress and can form a strong frontal zone 10-30 km offshore of an area where much oil and gas production occurs. Coastal fronts are environmentally important since the surface convergences that occur at the boundary of the dissimilar water types are capable of affecting the dispersal of spilled pollutants. This front can be considered as a buffer between offshore pollutant spills and the tourist-attractive coasts of Texas. The front can dominate the nearshore environment for much of the year, and historical wind stress data indicate that it could be expected along the upper Texas coast from September through April. The mechanism which support the frontal zone is discussed, and the results indicate that other as of yet undetected fronts may exist in areas close to river outflows. The flow regimes of the front are presented, the knowledge of which would allow private and government agencies to better plan contigencies for handling spills from offshore energy production or transport. AN EMPIRICAL STUDY OF FACTORS AFFECTING BLUE-GREEN VERSUS NONBLUE-GREEN ALGAL DOMINANCE IN LAKES,
Michigan State Univ., East Lansing. Dept. of Resource Development.
K. H. Reckhow, and J. T. Simpson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-169311, Price codes: A06 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University, Project Completion Report, March 1980. 99 p, 17 Fig, 10 Tab, 65 Ref. OWRT A-102-MICH (3), 14-34-0001-9024.

Descriptors: *Algae, *Cyanophyta, *Lakes, *Blue-green algae, *Nonblue-green algae, *Algal dominance, Hydraulic detention, Variable relationships, Inorganic nitrogen, Hydraulic detention, Nitrogen, Alkaline water, *Temperate lakes, *Variable box plots, *Bivariate-discriminant plots.

In many lakes, the use and enjoyment of the water is limited due to the dominance of undersirable blue-green algae. Exploratory data analysis techniques were applied to 90 north temperate lakes included in the EPA National Eutrophication Survey to examine empirical relationships between: (1) the chemical and physical variables that affect algal dominance in lakes; and (2) the dominant algal type. Single variable box plots and bivariate-discriminant plots document the importance of the inorganic nitrogen concentration and hydraulic detention time in determining blue-green versus nonblue-green algal dominance in eutrophic lakes. The multivariate statistical technique of discriminant analysis was applied to 68 high alkalinity lakes in the data set to: (1) further identify variable relationships; and (2) construct a simple predictive model for algal dominance. Application of results are discussed in an ecological and management context.

STUDIES ON THE USEFULNESS OF DIFFERENT MESH-SIZE PLANKTON NETS FOR THICKENING ZOOPLANKTON,
Polish Academy of Sciences, Warsaw. Dept. of Hydrobiology.
J. Ejsmont-Karabin.
Ekologia Polska, Vol 26, No 3, p 479-490, 1978. 2 Fig, 5 Tab, 4 Ref.

Descriptors: *Zooplankton, *Bottom sampling, *Plankton nets, *Eutrophication, *Lakes, Lake Mikolajskie(Poland), Lake Inulec(Poland), On-site data collections, Equipment, Rotifers, Crustaceans, Cyclopidae, Keratella cochlearis, Polyarthra vulgaris, Data collections, Monitoring, Size, Density, Trophic level, Poland.

Eight series of experiments were carried out July 1975 on two eutrophic lakes in Poland to determine how mesh size of a plankton net affects zooplankton composition of filtered samples; recommendations include using nets with smaller mesh sizes (20 micro mm) when filtering plankton in less fertile lakes and using larger mesh sizes (60 micro mm) when filtering plankton in eutrophic lakes. In Mikolajskie Lake (498 ha, 25.9 m max depth, 11.1m avg depth) and Lake Inulec (178.3 ha, 10.1 max depth, 4.6 m avg depth) four tests each were carried out; the tests utilized four different kinds of plankton nets: 10, 20, 30 and 60 micro mm mesh size. Results show that filtering lake water samples through these four net sizes causes losses of the original rotifer numbers; losses are 27%, 32%, 43% and 54%, respectively. Netting does not affect the number of crustaceans, mainly nauplii of Cyclopidae; only 10% of nauplii are lost when 60 micro mm mesh size netting are used. Types and magnitudes of losses among rotifer fauna depends not only on mesh size but also on morphology and body size of individuals and on density of animals within the filtered samples. Generally losses increase with greater individual body size and decrease with greater animal density. It is noted that the average number of eggs per female changes due to filtration; results include a slight reduction for the ovigerous species (Keratella cochlearis) and an almost two-fold increase for non-ovigerous species (Polyarthra vulgaris). THE USE OF PERIPHYTON FROM LAKE ZURICH TO EXTIMATE THE ALGAL GROWTH POTENTIAL IN RIVER LIMMAT WATER,
Zurich Univ. (Switzerland). Hydrobiology-Limnology Station.
F. Schanz, and B. Betschart.
Swiss Journal of Hydrology, Vol 41, No 1, p 141-149, October 1979. 4 Fig, 2 Tab, 36 Ref.

Descriptors: *Algal growth potential, *Periphyton, *Bioassay, *River Limmat(Switzerland), *Sewage effluents, Lake Zurich(Switzerland), Effluents, Algae, Sewage disposal, Biomass, Methodology, Testing procedures, Chlorophyll, Proteins, Growth rates, Analytical techniques, Water water(Pollution), Variability, Laboratory tests, Environmental effects, Water quality, Switzerland.

This paper discusses sewage wastewater influence on algal growth potential in River Limmat water, downstream from Lake Zurich, Switzerland and methods used to estimate algal growth potential (AGP). When natural periphyton under nonsterile conditions is used to estimate AGP in River Limmat water, influence from the Zurich sewage treatment plant can be followed easily. Biomass is estimated by protein determination, chlorophyll determination, KMn04-consumation and ash-free dry weight, using natural periphyton in the bioassay. KMn04-consumption shows lesser standard deviation than is obtained with other determinations. Validity of biomass determination with KMn04-consumption or ash-free dry weight are practically the same. Variation coefficients are generally low. In routine experiments with large numbers of culture vessels, ash-free dryweight determinations are very time consuming. Therefore, KMn04-consumption method is preferred. AGP of the water from Quaibridge (Lake Zurich) to Unterengstringen-right is much lower than the AGP from Unterengstringen-left and sampling stations below. This is due to the influence of the sewage treatment plant Werdholzli immediately upstream of Unterengstringen on the left side of Limmat River. Differences between Unterengstringen-right and Unterengstringen-left are caused by incomplete mixing of river water with wastewater. (Danovich-Wisconsin)

EFFECT OF NUTRIENT INFLOW ON THE BACTERIAL FLORA IN THE RIVER SAKURAGAWA, JAPAN,
Tsukuba Univ., Ibaraki (Japan). Inst. of Biological Sciences.
H. Seki, and Y. Takahara.
Internationale Revue Der Gesamten Hydrobiologie, Vol 64, No 3, p 417-424, 1979. 2 Fig, 5 Tab, 5 Ref.

Descriptors: *Eutrophication, *River Sakuragawa(Japan), *Nutrients, *Bacteria, Nitrogen, Phosphorus, Cyanophyta, Trophic level, Inorganic compounds, Domestic wastes, Fertilizers, Water pollution sources, Agricultural runoff, Plankton, Biomass, Density, Heterotrophy, Dystrophy, Nannoplankton, Microorganisms, Japan.

Organic nutrients for bacteria in the Sakuragawa River, Japan during June 1976-July 1977 were mainly autochthonous, suggesting that pollution was never present in sufficient quantity to induce dystrophy. The Sakuragawa drains 349 sq km, 26% of which is paddy fields fertilized by 1900 tons of nitrogen and 1600 tons of phosphorus annually. The city of Tsuchiura also discharges domestic wastes into the river; however, the river discharges only 520 tons of nitrogen and ten tons of phosphorus annually. Nutrient levels and bacteria were collected weekly from sampling stations located in: (1) headwaters free of pollution; (2) just upstream of Tsuchiura where nutrients are increased by agricultural runoff; (3) at the river mouth; and (4) at the estuary harbor. In polluted river areas, the percentage of heterotrophs in bacterioneuston (5.6%) is significantly different from that in bacterioplankton (7.7%). Statistical analysis reveal no significant difference in either percentage at any station in the polluted area. At upstream Station 1, bacterioplankton mean density is 1.6 million cells/ml. In the polluted area, bacterioplankton densities are 8.0 million cells/ml at Station 2; 7.6 million cells/ml at Station 3; and 11.0 million cells/ml at Station 4. Bacterioneuston density varies 8.7 million cells/ml at Station 2; 8.4 million cells/ml at Station 3 and 13.0 million cells/ml at Station 4. Mean density of planktonic heterotrophs at Station 1 ranges 1/50 to 1/100 of the values for polluted areas. (Danovich-Wisconsin)

THE ROLE OF ZOOPLANKTON IN THE NITROGEN DYNAMICS OF A SHALLOW ESTUARY,
Duke Univ., Beaufort, NC. Marine Lab.
S. L. Smith.
Estuarine and Coastal Marine Science, Vol 7, No 6, p 555-565, December 1978. 4 Fig, 2 Tab, 29 Ref. NSF GX33502.

Descriptors: *Zooplankton, *Estuaries, *Cycling nutrients, *Ammonia, *Ureas, *Newport River estuary(NC), Beaufort(NC), Nitrogen, Phytoplankton, Copepods, Primary productivity, Nitrogen cycle, Standing stocks, Shallow water, Nutrients, Nutrient requirements, Foods, Metabolism, Water properties, Water quality, Food chains, Estuarine environment, North Carolina.

Experiments in which nitrogen assimilation by phytoplankton and nitrogen release by copepods was observed in Newport River estuary, North Carolina, September 1973-April 1974, showed that zooplankton are probably not the major source of regenerated nitrogen. Both urea and ammonia are used by phytoplankton in the Beaufort estuary and are released by zooplankton at rates that depend on species, sex, season and feeding history. Phytoplankton primary productivity depends almost totally on regenerated nitrogen; amounts released by zooplankton provided an average of only 16% total phytoplankton nitrogen uptake. Other sources of regenerated nitrogen in the estuary are fish populations, benthic community, fouling community, sewage, microzooplankton and bacteria. Ammonia released by zooplankton averages 8% of the rate of ammonia assimilation by phytoplankton. Percentages range from 1% in October when phytoplankton standing crops are relatively large and phytoplankton ammonia assimilation high to 17% in March when phytoplankton standing stock is small and ammonia assimilation low. Release rates range 0.1-9.7 mg N/cu m d, while assimilation rates range 1-101 mg N/cu m d. Newport River estuary is part of a series of shallow estuaries behind the Outer Bands of North Carolina; average depth is 1.2 m. The estuary receives runoff from fertilized farmland, effluents from fish processing plants, and sewage from primary and secondary treatment plants. Copepod Acartia tonsa is numerically dominant at all times. (Danovich-Wisconsin)

ALGAL RESPONSE TO A THERMAL EFFLUENT: STUDY OF A POWER STATION ON THE PROVO RIVER, UTAH, USA,
Bringham Young Univ., Provo, UT. Dept. of Botany and Range Science.
L. E. Squires, S. R. Rushforth, and J. D. Brotherson.
Hydrobiologia, Vol 63, No 1, p 17-32, March 1979. 9 Fig, 2 Tab, 33 Ref.

Descriptors: *Provo River(UT), *Thermal pollution, *Electric powerplants, *Sessile algae, *Environmental effects, Algae, Diatoms, Thermal stress, Thermal water, Water temperature, Effluents, Primary productivity, Distribution, Speciation, Growth rates, Environmental gradient, Statistics, Statistical methods, Periphyton.

Water temperature increases caused by thermal discharges are highest 100-135 m downstream of the Hale generating station on the Provo River in Utah and a unique algal community is attributed to this thermal discharge. The attached algal community of this small fast-moving mountain river was observed October 1975-August 1977. Diatoms, Cladophora glomerata, and Hydrurus foetidus are major constitutents. Cocconeis placentula (euglypta) is common throughout the year and dominates diatom flora spring to fall. C. glomerata and H. foetidus are abundant fall to spring. Flora display an overall similarity in specific composition but with zonation related to local environmental conditions. Effects from elevated temperatures in river sections below the effluent area could not be distinctly isolated; however, the effluent area which estends 100-135 m downstream from the thermal discharge point contains flora significantly different from other river areas. The effluent area is characterized by heavy C. glomerata growth, lack of foetidus growth, high diatom production but low diversity, C. placentula dominance throughout the year and a consistently distinct diatom community composition. Temperatures in this area range 0-10C above ambient just below the outfall and 0-3.5C above ambient 135 m downstream. (Danovich-Wisconsin)
W80-04449

SPATIAL PATTERNS IN NORTH SEA PLANKTON,
Woods Hole Oceanographic Institution, MA.
J. H. Steele, and E. W. Henderson.
Deep-Sea Research, Part A-Oceanographic Research Papers, Vol 26, No 8, p 955-963, August 1979. 6 Fig, 16 Ref.

Descriptors: *Population dynamics, *Spatial distribution, *North Sea, *Plankton, Ecosystems, Distribution, Zooplankton, Grazing, Growth rates, Population, Temperature, Chlorophyll, Temporal distribution, Physical properties, Variability, Theoretical analysis, Nutrients, Phytoplankton.

Surveys of near-surface horizontal distributions of temperature, salinity, nitrate and chlorophyll were carried out April-June 1976 in the North Sea; results make it possible to distinguish periods when phytoplankton growth is affected mainly by physical dispersion from periods when grazing is the controlling factor. Data on chlorophyll and zooplankton concentrations confirm great variability in space and time, especially in scales 0.1-100 km and 1-100 days and this makes it difficult to interpret temporal sequences of data in terms of separate or combined effects of physical processes, nutrient limitation or grazing. The 1976 growth sequence, although irregular, was much lower than in earlier 1974 studies; this could have resulted from nutrient limitation. The spectral ratio of chlorophyll to temperature decreases or increases with increasing wave number for positive or negative growth rates. The variance slope ratio of chlorophyll and temperature is used to measure chlorophyll spectra divergence from that expected solely from physical processes. During periods of phytoplankton growth or significant plant-herbivore interactions, the slope is negative indicating increased biological variance at low wave numbers. Positive slope corresponds to a dominance of the limiting effects of nutrient and physical factors on phytoplankton with declining populations. A zero slope indicates that physical factors alone are dominant in determining phytoplankton distributions. Data indicate that grazing is the controlling factor in May 1976 because the variance slope is negative. (Danovich-Wisconsin)

FECUNDITY AND BODY SIZE OF PLANKTIC ROTIFERS IN 30 POLISH LAKES OF VARIOUS TROPHIC STATE,
Warsaw Univ. (Poland). Dept. of Hydrobiology.
W. Sterzynski.
Ekologia Polska, Vol 27, No 2, p 307-321, 1979. 3 Fig, 1 Tab, 35 Ref.

Descriptors: *Lakes, *Rotifers, *Fecundity, *Size, *Food abundance, Pelagic zone, Zooplankton, Trophic level, Foods, Dissolved oxygen, Oxygen, Productivity, Length, Correlation analysis, Speciation, Pomeranian Lake region(Poland), Poland.

Investigations of 30 Polish lakes in the Pomeranian region June-July 1975 demonstrate that under natural conditions even when lakes are not much different with regard to food resources, food is a significant factor controlling rotifer fecundity and size. Oxygen deficit in hypolimnion layers was treated as a basic trophic index and thus of lake biological production and food resources. Both June and July populations exhibit very high fecundity variations. Polyarthra sp had the highest variability range and highest average fecundity. With increasing food resources, fecundity of Keratella cochlearis, K. quadrata and Polyarthra sp increased, whereas Kellicottia longispina fecundity decreased. K. cochlearis and Polyarthra sp fecundity depended mostly on food abundance. With increasing food supply, rotifer body length decreased. K. cochlearis and K. quadrata size changed the most; K. longispina size changed only slightly. Average body length of K. cochlearis in July was 11.4% smaller than in June; K. quadrata decreased analogously by 7.2% and K. longispina by only 1.9%. The Pomeranian lake region has no oligotrophic lakes; however, the trophic index, oxygen deficit, ranged 15.5% to 97.4% in June. (Danovich-Wisconsin)

MECHANISMS OF RAPID PHOTOSYNTHETIC ADAPTATION IN NATURAL PHYTOPLANKTON COMMUNITIES. I. REDISTRIBUTION OF EXCITATION ENERGY BETWEEN PHOTOSYSTEMS I AND II,
Department of Scientific and Industrial Research, Taupo (New Zealand). Ecology Div.
W. F. Vincent.
Journal of Phycology, Vol 15, No 4, p 429-434, December 1979. 6 Fig, 3 Tab, 14 Ref.

Descriptors: *Phytoplankton, *Light intensity, *Lake Windermere(Great Britain), *Photosynthesis, *Adaptation, Lakes, Chlorophyll, New Zealand, Fluorescence, Trophic level, Aquatic plants, Irradiation, Bioluminescence, Light, Surfaces, Light penetration, Population, Metabolism, Plant physiology, Great Britain.

Intensities of in-vivo chlorophyll fluorescence were recorded for water columns of six (New Zealand, England) lakes of different trophic status and phytoplankton composition. Decreased yields in chlorophyll fluorescence were recorded in surface waters of all lakes, irrespective of trophic status or location. Beyond a threshold light level in each lake, fluorescence light decreased with increasing light intensity. For five New Zealand lakes, which were all surveyed in late winter under the same irradiance conditions (1500 microEin/sq m/second), all threshold light intensities lay within 54-62% of surface illuminance. The time course of fluorescence depression and recovery process was examined with Lake Windermere (England) samples. Fluorescence exponentially decreases upon exposure to bright light, the response is 100% (5 m samples) and 83% (dim light-adapted 0 m samples) complete within 2 minutes. Chlorophyll fluorescence values increase in dim light after a lag of 60 seconds; the rate of increase decreases exponentially with time. Deep (6.5 m) populations from Lake Windermere exhibit time-dependent variations in chlorophyll fluorescence over the first 25 seconds of exposure to 450 nm light. These observations are interpreted in terms of decreased spillover from photosystem II to photosystem I with increasing depth, to a minimum at threshold light intensity below which cells are in light state I. (Harris-Wisconsin)

SUBFOSSIL CHIRONOMIDS AS EVIDENCE OF EUTROPHICATION IN EKOLN BAY, CENTRAL SWEDEN,
National Swedish Environment Protection Board, Uppsala. Limnological Survey.
T. Wiederholm, and L. Eriksson.
Hydrobiologia, Vol 62, No 3, p 195-208, February 1979. 7 Fig, 3 Tab, 23 Ref.

Descriptors: *Ekoln Bay(Sweden), *Cores, *Sediments, *Trophic level, *Chironomidae, *Paleolimnology, Lake Malaren, Sweden, Eutrophication, Tubificids, Benthic fauna, Diptera, Limnology, History, Paleohydrology, Nutrients, Ecology, Ecosystems, Chlorophyll, Distribution, Speciation, Phosphorus, Nitrogen, Fertilizers.

Stratification of chironomid head capsules within three 65-76 cm sediment cores taken from Ekoln Bay, a highly eutrophic basin in Lake Malaren, central Sweden, reflects the lake's trophic status over the past 150 years. Successive but slow eutrophication due to more intensive land use occurred from the 1800's to 1920's. A more rapid change in trophic conditions resulting in bottom water oxygen depletion occurred 1940-1950. Changes were presumably caused by increased sewage load-

ing and more extensive use of commercial fertilizers in agriculture. Highly eutrophic conditions continued until recent years. With information from numerous Swedish lake studies, subfossil chironomid assemblages were used to estimate nutrient and chlorophyll levels in Ekoln Bay during different time periods. Reducing nutrient loading through advanced sewage treatment would half phytoplankton biomass from that occurring during the last ten years. Sediment cores revealed 819 individuals distributed over 21 genera. Phaenopsectra, Chironomus and Procladius account for 65% of the material; Micropsectra and Tanytarsus make up an additional 25%. Micropsectra and Phaenopsectra are strongly associated with oligotrophic-mesotrophic conditions. In the top 20 cm Chironomus and Procladius were by far the most abundant taxa. (Danovich-Wisconsin)

PHOSPHATE REQUIREMENT OF ANABAENA OSCILLARIOIDES AND ITS ECOLOGICAL IMPLICATIONS,
Auckland Univ. (New Zealand). Dept. of Botany.
C. W. Y. Lam.
Hydrobiologia, Vol 67, No 1, p 89-96, November 1979. 5 Fig, 2 Tab, 32 Ref.

Descriptors: *Anabaena, *Nutrient requirements, *Phosphates, *Waikato River(New Zealand), Cyanophyta, Algae, Phosphorus, Ecology, Environmental effects, Laboratory tests, Cytological studies, Cultures, Growth rates, Enzymes, Limiting factors, Metabolism, Plant physiology, Population, Primary productivity, New Zealand.

Anabaena oscillarioides when grown in filtered water from the Waikato River, New Zealand, produces well-recognized phosphorus (P)-deficiency symptoms such as high alkaline phosphatase activity and low intracellular P content, indicating that the river phosphate content is inadequate to support good algal growth. With phosphate supplements, all P-deficiency characteristics disappear, confirming that phosphate is the limiting nutrient for Anabaena in the Waikata River. Filtered river water supplemented with 1000 micro g P/l above ambient levels, sustains a much higher Anabaena growth (5.1 million cells/ml) when compared with ambient river water (1.8 million cells/ml) after eight days growth. The highest intracellular P content in P-supplemented algae is 0.066 micron micro g P/cell and in ambient water 0.0094 micron micro g P/cell; the minimum P content in inoculum algae is 0.0016 micron micro g P/cell. Rinal algal yields increase with phosphate-P concentrations 0-100 micro g/l; beyond 100 micro g/l, increases in phosphate concentrations do not affect the growth rate significantly but do increase final algal yields. Ks, the half-saturation constant, is 67 micro g/l; this low phosphate affinity probably does not allow algal growth to proceed at high rates. When river water is supplemented with 100 micro g P/l, doubling time is reduced from two days to 0.5 days. (Danovich-Wisconsin)

DIATOM ASSOCIATIONS AND SUCCESSION IN LAKE KARIBA, SOUTH CENTRAL AFRICA,
University of the Witwatersand, Johannesburg (South Africa).
F. D. Hancock.
Hydrobiologia, Vol 67, No 1, p 33-50, November 1979. 8 Fig, 1 Tab, 31 Ref.

Descriptors: *Diatoms, *Succession, *Speciation, *Lake Kariba, Africa, *Spatial distribution, *Lake basins, Plankton, Algae, Distribution, Seasonal, Melosira, Limnology, Lake morphology, Biomass, Water temperature, Dominant organisms, Hydroelectric plants, Dams, Pondage, Population, Zambesi River(Africa), Africa, Zambia, Rhodesia.

Except for the northeast Sanyati sub-basin (part of Lake Kariba, a very large lake formed between Zambia and Rhodesia for hydroelectric power) diatom associations show a gradual change from upper to lower lake and basin individuality is not evident. Kariba was studied 1959-1972 and diatom associations were analyzed in relation to the thermal cycle in different lake basins. A dominant association composed of Melosira granulata, M. granulata angustissima and M. distans alpigena demonstrate a succession pattern. The first two species, by variations in their percentage occurrence, show a gradual change from lacustrine conditions prevailing at the barrier area of the Sanyati basin to riverine conditions of uppermost basins. A second association formed by Cyclotella, Fragilaria and Synedra species is a regular feature of the diatom population. It is sub-dominant to the Melosira association in the barrier area but becomes more reduced in up river basins. The northeast Sanyati sub-basin disrupts the general pattern and shows individuality; accidental and ambivalent plankters are co-dominant with the Melosira association during homothermy. Lake Kariba is warm (17-32C), monomicitic and mesotrophic. Upper basins are influenced by Zambesi River, the lower basins by climatic conditions. Overturn commences in March in riverine basins and in May at the barrier with 21-22C average water temperatures. Stratification commences in upper basins in June and occurs in August in lower basins. STEADY-STATE GROWTH AND CHEMICAL COMPOSITION OF THE MARINE CHLOROPHYTE DUNALIELLA TERTIOLECTA IN NITROGEN-LIMITED CONTINUOUS CULTURES,
Woods Hole Oceanographic Institution, MA.
J. C. Goldman, and D. G. Peavey.
Applied and Environmental Microbiology, Vol 38, No 5, p 894-901, November 1979. 6 Fig, 2 Tab, 35 Ref. NOAA 04-8-M01-149 and NSF OCE-7819420.

Descriptors: *Cultures, *Limiting factors, *Nitrogen, *Chlorophyta, *Growth rates, *Laboratory tests, Carbon, Phosphorus, Marine algae, Equations, Culture media, Nutrients, Chemical properties, Phytoplankton, Dunaliella tertiolecta, Nitrates, Ureas, Nitrites, Ammonia, Cytological studies.

Continuous-culture experiments of marine chlorophyte Dunaliella tertiolecta under ammonia-, nitrate-, nitrite- and urea-N limitations show that this species can adapt to exploit different potentially available nitrogen (N) sources in natural water without appreciable differences in growth rates. The highest dilution rate which maintains a steady-state population is 1.33/d. Nitrogen cell quota (Q-n) varies from 1.3 pg of N/cell (k-Q) at zero growth rate (u=0) to 7.0 pg of N/cell (Q-m) at a maximum growth rate (u-max). Under enriched batch conditions, Q-m is 8.8 pg of N/cell. Specific growth rate is 1.66/d. The ratio between the minimum cell quota (k-Q) and maximum cell quota (Q-m) is 0.19; therefore, there is no substitute for determining u-max experimentally. Trends in carbon (Q-c) and phosphorus (Q-p) cell quotas with varying steady state growth are very similar: virtually no effect of growth on either cell quota up to u=1.1/d (=0.8 u-max), followed by very rapid increase up to u-max, indicating that a threshold value must be reached before growth occurs. Values of u-max are similar when determined either by cell washout technique or batch growth in enriched medium. Results indicate physiological limits in cellular constituency under N limitation; however, this information does not provide clues to natural population responses to nutrient exposures which vary temporally and spatially on a microscale. FACTORS CAUSING ELEVATED BIOLOGICAL OXYGEN DEMAND IN THE LITTORAL ZONE OF LAKE WINGRA, WISCONSIN,
Wisconsin Univ., Madison. Dept. of Botany.
S. R. Carpenter, A. Gurevitch, and M. S. Adams.
Hydrobiologia, Vol 67, No 1, p 3-9, November 1979. 3 Fig, 4 Tab, 25 Ref.

Descriptors: *Biochemical oxygen demand, *Littoral, *Lake Wingra(WI), *Macrophytes, *Leachate, *Eutrophication, Pelagic zone, Organic matter, Myriophyllum spicatum, Nitrates, Ammonia, Phosphates, Correlation analysis, Organic compounds, Inorganic compounds, Phosphorus, Water temperature, Aquatic weeds, Carbon, Decomposing organic matter, Wisconsin.

High BOD values that occur in filtered littoral waters in Lake Wingra, Wisconsin are due primarily to greater concentrations of labile dissolved organic carbon, and secondarily to greater dissolved phosphate concentrations. Increased organic carbon accounts for most of the increased oxygen uptake, although phosphate stimulates BOD to some degree. Lake Wingra weedbeds add labile dissolved organic carbon to littoral waters. Between June and September, littoral BOD averages 0.31 mg/l higher than that of pelagic water. Effects of several environmental factors (water temperature; phosphate, nitrate or ammonia concentrations; and dissolved organic matter from decaying macrophytes) on BOD in filtered Lake Wingra water was examined. Low correlation was observed between BOD and water temperature. Although inorganic phosphorus does not significantly correlate with BOD in field data, phosphate has a small but significant effect on BOD in enrichment experiments. Dissolved organic phosphorus significantly correlates with BOD in field data; enrichment with macrophyte leachate markedly affects BOD. Nearly all macrophyte leachate oxidizes during BOD incubations. BOD is not influenced by nitrate or ammonia enrichments. Lake Wingra is a hardwater eutrophic lake with 2.4 m mean depth. Dense week beds dominated by Myriophyllum spicatum (Eurasian water-milfoil) cover a third of the lake's surface. (Danovich-Wisconsin)

A COMPENDIUM OF LAKE AND RESERVOIR DATA COLLECTED BY THE NATIONAL EUTROPHICATION SURVEY IN EASTERN NORTH-CENTRAL, AND SOUTHEASTERN UNITED STATES.
National Eutrophication Survey, Corvallis, OR.
Working Paper No 475, September 1978. 268 p.

Descriptors: *Basic data collections, *National Eutrophication Survey, *Lakes, *Regions, *Reservoirs, *Trophic level, Atlantic coastal plain, Central U.S., Appalachian Mountain region, Northeast U.S., Southeast U.S., Eutrophication, Mesotrophy, Oligotrophy, Lake morphometry, Physicochemical properties, Biological properties, Cycling nutrients, Nonpoint sources, Nutrients, Data collections.

Individual lake and reservoir reports for 153 bodies of water in 17 eastern U.S. states include data on trophic conditions; nutrient sources, loads and controllability; and limiting nutrients. Each report also includes National Eutrophication Survey (NES) data pertaining to the water body, the drainage area, and nutrient point sources. To make NES data accessible to many users, data in each lake report are summarized and include information on water bodies sampled during the second year of the survey. States included here are Alabama, Delaware, Florida, Georgia, Illinois, Indiana, Kentucky, Maryland, Mississippi, New Jersey, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Virginia, and West Virginia. Trophic conditions for each lake are based on an assessment of data collected during the sampling year supplemented by results of past studies, if any, and communications with state personnel. Each water body is characterized either as 'oligotrophic' (implying low nutrient levels and productivity), 'eutrophic' (with high nutrient levels and productivity), 'mesotrophic' (with moderate nutrient levels and productivity) or 'hypereutrophic' (with very high nutrient levels and productivity). For large water bodies, two or more trophic categories are sometimes indicated. Data are arranged in five categories: (1) morphometry, (2) physical and chemical characteristics, (3) biological characteristics, (4) nutrient loading characteristics, and (5) nonpoint source nutrient export. A TIME- AND DEPTH-DEPENDENT MODEL FOR PHYSICAL, CHEMICAL AND BIOLOGICAL CYCLES IN TEMPERATE LAKES,

Washington Univ., Seattle. Dept. of Oceanography.
R. A. Walters.
Ecological Modelling, Vol 8, p 79-96, January 1980. 5 Fig, 1 Tab, 36 Ref.

Descriptors: *Mathematical models, *Mixing, *Physical properties, *Biological properties, *Lakes, *Temperate, *Primary productivity, Stimulation analysis, Turbulence, Cycles, Water temperature, Thermal stratification, Mathematical studies, Equations, Lake Washington(WA), Chemical properties, Cycling nutrients, Phytoplankton, Growth rates, Time, Depth, Diffusion.

A model has been developed in which eddy diffusion of algal cells and dissolved nutrients is consistent with mixing processes which influence the thermal structure of the lake. Using standard modeling formulations for net production, respiration and nutrient uptake, results show that chlorophyll-a and nutrient distributions are controlled to a large extent by turbulent mixing processes considered in the thermal model. The thermal model follows the general approach of Sundaram and Rehm which leads to a physically realistic description of temperature structure, particularly around the start of stratification in spring. The general biological model considers dependent variables as continuous in space and time, and details nutrient movements within lakes. The biological production model is formulated in terms of paired, coupled, nonlinear partial differential equations governing chlorophyll-a and dissolved phosphorus distributions. The equations are solved by finite differences and iteration techniques. A number of formulations for eddy diffusivity in the epilimnion and hypolimnion were evaluated and the results are compared with 1963 data for Lake Washington, Washington. Simulation results compare favorably with measured distributions in Lake Washington. It concludes that a close relationship can exist between the stratification cycle and algal-nutrient distributions. The numerical model was developed to study complex relationships between physical, chemical and biological processes occurring in many deep, stratified temperate lakes. (Danovich-Wisconsin)

A COMPUTATIONAL MODEL FOR GROWTH AND HARVESTING OF THE MARINE ALGA ASCOPHYLLUM NODOSUM,
Central Inst. for Industrial Research, Oslo (Norway).
K. L. Seip.
Ecological Modeling, Vol 8, p 189-199, January 1980. 5 Fig, 2 Tab, 28 Ref.

Descriptors: *Norway, *Harvesting of algae, *Cutting management, *Mathematical models, *Vegetation regrowth, Ascophyllum, *Algae, Growth rates, Harvesting, Time, Productivity, Biomass, Natural resources, Resources management, Mortality, Density, Curves, Long-term planning, Aquatic weeds, Marine algae, Simulation analysis.

A simulation model for the growth and harvesting of marine alga Ascophyllum nodosum in northern and western Norway shows that yield depends upon environmental factors and on harvesting procedures. For a given area and a given technology, the optimum harvesting strategy is determined in terms of harvesting frequency and cutting degree. Two different harvesting strategies are developed, one giving high instantaneous yield and the other giving high long-term yield. The latter incorporates elements of counterintuitivity on a practical level, but this strategy is preferred as new and more efficient algal cutting devices are introduced. At frequent harvesting intervals substantially less algal biomass should be removed than is technologically feasible with current implements. For each choice of regrowth period, an optimum cutting degree is found with respect to long-term yield. At periods of two, three and four years, a base vegetation of 20%-30%, 8%-10% and 3%-4% should be left for regrowth, respectively. A full size plant takes 5-8 years to grow. Annual mortality rates vary depending upon locality and climatic changes. A significant increase in average mortality occurs along a gradient from sheltered localities (20% mortality) to exposed localities (40% mortality). Yields increase by 50% when mortality decreases 40%-18% with a traditional cutting degree of 2% carrying capacity. Brown alga Ascophyllum is used in Norway as manure, animal fodder and raw material for seaweed meal and other industrial products. (Danovich-Wisconsin)

ULTRAVIOLET RADIATION AND PHYTOPLANKTON PHOTOSYNTHESIS,
Washington Univ., Seattle. Dept. of Oceanography.
C. J. Lorenzen.
Limnology and Oceanography, Vol 24, No 6, p 1117-1120, November 1979. 2 Fig, 9 Ref. NSF DES 74-00653A1.

Descriptors: *Phytoplankton, *Photosynthesis, *Ultraviolet radiation, *Coasts, *Oceans, Environmental effects, Puget Sound(WA), Pacific Ocean, Africa, Light, Radiation, Depth, Electromagnetic waves, Solar radiation, Euphotic zone, Ozone, Algae, Metabolism, Plant physiology.

Effects of present-day ultraviolet-B (290-320 nm) levels on phytoplankton photosynthesis and possible effects of elevated UV-B levels are assessed; UV-B removal increases C-14 incorporation and threshold levels occur at rather low absolute values. Therefore, a reasonable fraction, even up to 50%, of the euphotic zone experiences photosynthetic activity suppression due to natural present-day UV-B levels. Doubling of UV-B affects a layer 4.6 m and 0.2 m for oceanic and coastal waters, respectively. Observations were taken at four geographical locations: Puget Sound; shelf waters off the Washington coast; open ocean in the North Pacific; and shelf waters off northwest Africa. In coastal waters with 5 m euphotic zone, differences in C-14 uptake are detected at 1.2-1.5 m; this corresponds to 0.1-0.01% surface UV-B levels. In open ocean waters, a larger fraction of the euphotic zone is similarly affected. A sunburning radiation of 600 counts/30 min corresponds to UV-B levels experienced at local apparent noon when total incident radiation is 1.25 ly/min. Effects of UV-B levels on photosynthesis probably does not alter data on estimates of oceanic production. However, UV-B effects are important when discussing vertical structures of phytoplankton populations since production estimates in the upper 1/6-1/10 of the euphotic zone are significantly overestimated. Lethal limit of UV-B to algal cells, variability in algal genetic pool in its resistance, repair capability, and the magnitude of vertical mixing in upper euphotic layers are still unknown. AN ANALYTICAL INTEGRATION METHOD OF COMPUTING DIURNAL PRIMARY PRODUCTION FROM STEELE'S LIGHT RESPONSE CURVE,
Stockholm Univ. (Sweden). Dept. of Zoology.
A. Engqvist, and S. Sjoberg.
Ecological Modeling, Vol 8, p 219-232, January 1980. 4 Fig, 1 Tab, 11 Ref, 1 Append.

Descriptors: *Light, *Primary productivity, *Curves, *Mathematical studies, *Methodology, Photosynthesis, Analytical techniques, Diurnal, Mathematical models, Ecosystems, Phytoplankton, Aquatic environment, Equations, Time, Depth, Seasonal, Computers, Simulation analysis, Ecology.

Exact time integrals of both Steele's original function and its depth integrated version are deduced analytically, assuming a sinusoidal diurnal variation in light; this method of analytical integration is advantageous in combining high numerical accuracy with comparatively little computational effort. The photosynthesis-light response is an important process in all mathematical models of phytoplankton primary production in aquatic habitats. Steele's mathematical formulations are simple; only one parameter is required to determine the general shape of the light-response curve. Its explicit depth and time integrals are stated but only approximate and/or graphic solutions are attempted for its integration in time. An exact analytical solution is presented as well as an efficient algorithm for its numerical evaluation. The method is tested in a sample diurnal ecosystem simulation. Most primary production takes place in 0-10 m, independent of season; very little production occurs below 20 m. Diurnal production in the mixed layer predicted by Steele's formula is a hyperbolic of light intensity at midday. Production differences at different seasons with the same light intensity at noon, result mainly from different photoperiod lenghts. For winter solstice, equinox and summer solstice, numerical integration with trapezoidal rules requires one and a third, twice and three times more computing time, respectively, to obtain corresponding curves with the same accuracy as analytical integration methods. APPLICABILITY OF CELLULAR EQUILIBRIUM AND MONOD THEORY TO PHYTOPLANKTON GROWTH KINETICS,
Manhattan Coll., Bronx, NY. Environmental Engineering and Science Program.
D. M. Di Toro.
Ecological Modeling, Vol 8, p 201-218, January 1980. 4 Fig, 2 Tab, 20 Ref, 1 Append. EPA R803030.

Descriptors: *Nutrients, *Phytoplankton, *Growth rates, *Kinetics, *Monod equation, *Equilibrium, *Metabolism, Nutrient requirements, Michaelis-Menten equations, Biochemistry, Mathematical studies, Biomass, Algae, Cycling nutrients, Approximation method, Population dynamics, Equations, Plant physiology, Cytological studies.

Two classes of kinetics are currently applied to phytoplankton growth: Monod theory states that growth rates depend on external nutrient concentrations while other formulations (Droop, Caperon) emphasize that growth rates depend on internal cellular nutrient concentrations. The more realistic case, in which both internal and external concentrations control uptake, is compared to Monod's growth theory and at steady-state with an appropriate definition for the half-saturation constant, results are essentially equivalent. Variable cellular nutrient concentrations still imply that nutrient stoichiometric ratios change in response to changing external concentrations. However, an important simplification is still possible. Relatively small errors are introduced if internal cellular concentration is assumed to be in dynamic equilibrium with external concentrations. This cellular equilibrium approximation is essentially a computational simplification. It has advantages since no new dynamic state variables are introduced into the formulation. The rapid dynamics of internal cellular concentrations are eliminated which in turn removes the possibility of cells having different internal concentrations within a volume segment since in this approximation, cells equilibrate immediately as they are transported to other volume segments. Computational results indicate cellular equilibrium approximations are adequate when considering nutrient flux to bottom sediments via algal settling if substrate concentration change rates are slow relative to phytoplankton growth rates. 5D. Waste Treatment Processes

ANAEROBIC-ACTIVATED CARBON FILTERS FOR THE REMOVAL OF REFRACTORY AND TOXIC ORGANIC COMPOUNDS IN WASTEWATER,
Georgia Inst. of Tech. Atlanta. School of Civil Engineering.
M. T. Suidan, W. H. Cross, M. Fong, J. W.

Calvert, and K. A. Khan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-164254, Price codes: A09 in paper copy, A01 in microfiche. Environmental Resources Center, Georgia Institute of Technology Technical Completion Report No ERC 08-79, November 1979. 176 p, 62 Fig, 22 Tab, 113 Ref. OWRT A-077-GA (1).

Descriptors: *Waste water treatment, *Phenols, *Anaerobic conditions, *Activated carbon, *Carbon filters, Organic loading, Toxins, Water purification, Pollutants, Industrial wastes, Spectrophotometry, Analytical techniques, Water pollution treatment, Chemical wastes.

An anaerobic filter with granular activated carbon was developed and tested for the effective and energy efficient treatment of waste water containing phenolic compounds. Two identical experimental reactors consisting of four jacketed columns and three clarifiers connected in series were tested. Each column had a reversible recirculation pump for the recirculation of the aqueous contents around each individual reactor. Granular activated carbon served as a media for microbial attachment, substrate concentration, and polarization. A feed substrate flow rate of 2 ml/min giving a total empty bed contact time of 46.48 hours was used with a recirculation flow rate of 50 ml/min. Two phenolic compounds, catechol and o-cresol, were tested at different organic loading rates in the reactors. Three feed concentrations, 200, 400, and 1,000 mg/l, of catechol were tested. For all three satisfactory steady state removal efficiencies were obtained for total organic carbon (81 to 94%), for chemical oxygen demand (88 to 94%), and for catechol (98 to 99%). The system exhibited stability to suddenly increased feed catechol concentrations by increased production of gas. Results were not as positive for the treatment of o-cresol bearing synthetic waste water. Only adsorption onto the activated carbon packing was obtained with no degradation of the o-cresol. While this study showed the potential of the anaerobic-activated carbon filter in the treatment of phenolic compounds, more investigation is recommended. (Seigler-IPA)

IMPROVEMENT OF THE QUALITY OF WASTE POND EFFLUENTS IN NORTHERN AREAS BY CHEMICAL PRE-PRECIPITATION,
Oulu Univ. (Finland). Water Research Lab.
J. U. Airaksinen.
Progress in Water Technology, Vol 10, No 6, p 899-906, 1978. 2 Fig, 1 Tab, 6 Ref.

Descriptors: *Finland, *Winter, *Chemical precipitation, *Waste water treatment, *Water temperature, *Costs, Biochemical oxygen demand, Effluents, Water quality, Water pollution control, Waste storage, Phosphorus, Economic efficency, Ponding, Ponds, Sludge disposal, Construction costs, Operating costs, Ii(Finland).

Investigations on several ponds in northern Finland 1974-1976 showed that chemical pre-precipitation increased BOD and phosphorus (P) removals; overall BOD removal rate became 2.5-fold. Study results also show that treatment efficiency decreases with reduced pond temperature as the freezing point is approached. Waste ponding is often the most economical method of treating wastewater; however, in winter with water temperatures 0-8C, ponds become anaerobic and P from bottom sludge returns into solution. The pond at Ii serves 1650 inhabitants and has 260 cu m/d average wastewater flow. Average BOD is 120 mg/l; total P and nitrogen (N) concentrations are 12.5 and 58 mg/l, respectively. Two successive processes occur in the treatment pond: chemical precipitation and biological treatment. Pre-precipitation basins have 300 cu m volume and coagulation is carried out with 230 g/cu m ferric chloride. Due to the use of chemicals and pre-precipitation, BOD removal efficiency increases 53%-84% and total P removal 11%-73%. N reduction is only 20%-30%. Total per-capita construction costs of the improved ponds are $20-$30 of plant costs applying simultaneous precipitation. Chemical precipitation creates large quantities of sludge. Evacuators and pumps are used to remove sludge for communities with more than 500 inhabitants. For smaller communities, a movable belt filter jointly owned by 5-6 communities is the best solution. (Danovich-Wisconsin)

ION EXCHANGE RECOVERY OF COBALT AND COPPER FROM BLACKBIRD MINE DRAINAGE,
Idaho Univ., Moscow. Water Resources Research Inst.
K. A. Prisbrey, J. F. Williams, and H. Lee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-166457, Price codes: A03 in paper copy, A01 in microfiche. Idaho Water Resources Research Institute. University of Idaho Research Technical Completion Report, January 1980. Presented at the 109th Annual AIME Meeting, Las Vegas, NV, February 24-28, 1980. 25 p, 14 Fig, 2 Tab, 10 Ref. OWRT A-067-IDA(1).

Descriptors: *Cobalt, *Acid mine water, *Mine drainage, *Ion exchange, Water purification, Copper, Idaho, Salmon, Rainbow trout, Spawning, Water pollution sources, Laboratory tests, Flow rates, Mathematical models, Mine wastes, Mining.

The use of gravity flow ion exchange resin beads to reduce acid mine drainage water pollution from the Blackbird Mine, a cobalt mine near Cobalt, Idaho, was examined. The mine is currently closed but, due to international cobalt trade disruptions, the Noranda Mining Company is interested in reopening the mine. The mine is located in a high mountain pass and acid drainage leaks into the Panther Creek drainage system are creating lethal conditions for salmon and steelhead for over 20 miles downstream. Bucktail Creek receives the polluted water and during the early spring it contains 274 ppm of copper and 51 ppm of cobalt, both of which are toxic to aquatic life. Conventional methods for controlling this pollution source are not feasible due to the mountain location and lack of power for equipment operation. Several kinds of ion exchange beads were considered and a macrocreticular weakly acid cation exchanger in sodium form with carboxylic functionality was found to reduce cobalt and copper concentrations to less than 0.1 ppm in creek water. The tough methacrylic acid copolymer provides long life while the large discrete pores allow for easy cation entry and adsorption. Laboratory tests performed on the beads include: equilibrium tests, rate studies on artificial solutions, and rate studies on creek water samples. Field tests were also conducted. A film diffusion model was developed to describe the rate data. (Seigler-IPA)

TREATABILITY OF CARCINOGENIC AND OTHER HAZARDOUS ORGANIC COMPOUNDS,
IIT Research Inst., Chicago, IL.
E. G. Fochtman, and W. Eisenberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-11683, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-097, August 1979. 68 p, 4 Fig, 9 Tab, 26 Ref, 2 Append. CI-68-03-2559.

Descriptors: *Organic compounds, *Waste water treatment, *Ozone, *Biodegradation, *Carbon filters, Oxidation, Water pollution treatment, Chemical degradation, Biological treatment, Sewage treatment, Activated carbon, Gas chromatography, Spectrophotometry.

The treatability of five chemical carcinogens in waste water by three treatment methods, biodegradation, carbon adsorption, and ozone oxidation, was examined. The chemical carcinogens tested were: naphthalene (NAP); 1, 1-diphenylhydrazine (DPH); beta-naphthylamine (BNA); 4, 4(1)-methylene-bis (2-chloroaniline) (MOCA); and dimethylnitrosamine (DMNA). The carcinogens were tested at levels of 1 mg/l or less in mineralized distilled water contaminated with the compounds. Both static and continuous reactors were used in the biodegradation tests. For the carbon adsorption tests two commercially available granular activated carbons were used, Filtrasorb 400 and Darco KB. A 12-liter reactor with 1 percent ozone in oxygen was used for the ozone oxidation studies. Analytical techniques used include high performance liquid chromatography, ultraviolet adsorption, high resolution gas chromatography, and spectrophotometric analysis. Results show that NAP can be successfully treated by all three techniques but reaction with ozone occurs slowly. The three carcinogens DPH, BNA, and MOCA can also be treated by all three processes. DMNA is biodegradable in continuous biological reactors but it resists ozone oxidation and is not adsorbed by carbon. Data from study results are given. (Seigler-IPA)

Experiments on lake restoration techniques for Lake Nakskov Indrefjord, Denmark, summer 1974 and 1976, showed that the best method is based on algal separation by alum coagulation followed by dissolved air flotation. Efficient algal separation occurs when alum is used alone without pH adjustment or addition of polymers as a coagulation aid. Phosphorus is reduced 91-93%, resulting in a 0.1 mg/l total phosphorus effluent concentration. Water passage through the algal pond also removes almost 100% of the dissolved nitrogen. Nakskov Indrefjord eutrophication is caused by high nutrient contents from two inflowing rivers, Halsted and Ryde. River water was continuously pumped through two pilot ponds May-October 1976. In Danish climate, algal ponds function only during summer months. In order to avoid zooplankton blooms one of the ponds was stocked with 325 small crucian carps. In the pond without fish, zooplankton predominated and phytoplankton numbers were small, using up little nitrogen. In the pond with fish, sufficient phytoplankton growth took place to make nitrogen growth-limiting. Phosphorus, present in excess, was controlled by

alum coagulation. Sedimentation and filtration methods were examined and also were satisfactory. Construction costs for an algal pond with chemical precipitation and flotation are estimated at $1.1 million. (Danovich-Wisconsin)

HYBRID APPROACH IN WATER QUALITY MANAGEMENT,
Goettingen Univ. (Germany, F.R.). Fachbereich Physik.
G. Romberg.
Progress in Water Technology, Vol 11, No 6, p 531-549, 1979. 12 Fig, 3 Tab, 7 Ref.

Descriptors: *Water pollution, *Rivers, *Model studies, Mathematical models, Hydraulic models, Pollutants, Organic matter, Oxygen, Dissolved oxygen, Water quality, Water treatment, Waste water(Pollution), Water pollution control, Analytical techniques, Systems analysis, Hybrid approach, River pollution.

A combination of a mathematical and a physical model (hybrid model) was presented as a tool to practice the following river water quality policies: (1) Water quality standards were designated as upper limits for wasteloads of the river water and as a lower limit on dissolved oxygen in the river water. The pollution introduced into the receiving waters must be controlled in order that these standards be met. (2) A waste discharge pricing policy was recommended. In this policy, each discharger has to pay in proportion to the amount of water quality degradation he causes. The river pollution was assumed to be due to discharges from waste treatment plants. The hybrid approach predicted the water quality degradation due to each discharger separately and allowed to model the following strategies to cope with violations of water quality standards: (1) change of discharge locations, (2) reduction of emission rates including a rollback strategy defined by an optimization problem, and (3) changing the seed of nearfield mixing regions. The effectiveness of these strategies was demonstrated on a special prototype system. (Sims-ISWS)

MODELLING NITRATE CONCENTRATIONS IN PUMPED STORAGE RESERVOIRS,
Ministry of Works and Development, Hamilton (New Zealand). Hamilton Science Centre.
J. C. Rutherford, and J. M. Davis.
Progress in Water Technology, Vol 11, No 6, p 327-336, 1979. 4 Fig, 4 Tab, 6 Ref.

Descriptors: *Reservoirs, *Pumped storage, *Nutrient removal, *Nitrates, Rivers, Lakes, Model studies, Mathematical models, Water temperature, Nutrients, Sodium, Potassium, Magnesium, Nitrogen, Algae, Water quality, Public health, *England.

During autumn and winter, nitrate concentrations exceed WHO limits in some British rivers used for water supply thereby posing a health hazard. Pumped-storage reservoirs act as buffers between raw water supplies and treatment plants attenuating peaks in river nitrate concentration by dilution and removing nitrate by biological processes. This potential could be exploited more fully with the aid of a mathematical model describing nitrate concentration changes which result from inflow, outflow, and biological removal. A zero-dimensional model was found adequate to describe weekly changes in nitrate concentration in two British reservoirs. The model was calibrated on each reservoir separately using one year of data, and then reproduced concentrations in other years with root mean square errors between 12% and 50% of the observed median. Model coefficients for the two reservoirs were significantly different, presumably because of differences in lake morphology and algal populations. This means that at present the model would need to be calibrated for each reservoir. The model can be used to prepare nomographs for a range of likely river nitrate levels, pumping rates, and seasonal temperature distributions. (Sims-ISWS)

HIERARCHICAL-MULTIOBJECTIVE APPROACH IN THE PLANNING AND MANAGEMENT OF WATER AND RELATED LAND RESOURCES,
Case Western Reserve Univ., Cleveland, OH. Systems Engineering Department.
P. Das.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-168818, Price codes: A14 in paper copy, A01 in microfiche. Ph.D. Dissertation, June 1976, 298 p, 11 Fig, 29 Tab, 258 Ref, Append. OWRT C-7047(No 6221)(4), 14-34-0001-6221.

Descriptors: *Water resource planning, Multiobjective optimization, Water quality, Surrogate worth trade-off method, Non-point source pollution, Biological oxygen demand, Hierarchical decomposition, Level-B planning, Pareto optimum, *Water management(Applied), *Resources development, Water resources development, *Land management.

A systematic methodological approach to the long-range planning and management of a regional water and related land resources system is presented. The needs for considering and including multiple objective functions in this noncommensurable format and units are discussed. A general multiobjective planning and management model for water and land resources is developed, considering economic development and environmental quality as the two major objectives. The economic objective constitutes the cost of point and nonpoint source pollution control, and the cost of water supply. The environmental quality model includes the following multiple objectives: (1) sediment; (2) phosphorus; (3) biological oxygen demand; and (4) dissolved oxygen deficit level in the stream. The mathematical models developed take into account the interactive nature of both ground and surface water, as well as multiple sources of pollutants from point and nonpoint sources. The Surrogate Worth Trade-off (SWT) method is used for the multi-objective analysis. Since the problem is large, hierarchical decompositions based on geographic and hydrologic boundaries are introduced. Finally, a case study problem on the Maumee River Basin is formulated and solved to illustrate the applicability and efficiency of the multiobjective planning framework developed. (Haimes-CWR)

NATIONAL WATER QUALITY INVENTORY 1976 REPORT TO CONGRESS.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 462, Price codes: A12 in paper copy, A01 in microfiche. Report No EPA-440/9-76-024, June 1977. 273 p, 6 Fig, 13 Tab, 1 Append.

Descriptors: *Water quality, *State governments, *Water pollution control, *Water Pollution Control Act Amendments of 1972(PL 92-500), Baseline studies, Water quality standards, Governmental interrelations, Federal Water Pollution Control Act, Bacteria, Heavy metals, Eutrophication, Urban runoff, Industrial water, Dissolved oxygen, Cycling nutrients, Toxins, Nonpoint sources, Point sources, Great Lakes, Regulation, Industrial wastes.

A summary of current water quality status of the states reiterates for the most part conclusions found in 1974 and 1975 national water quality inventory reports. In this update, excessive bacteria levels which limit recreational water uses are the most widely reported problem, particularly near urban areas, with high phosphorus and nitrogen concentrations also reported in many locations. Low dissolved oxygen levels are a problem primarily in smaller streams receiving large volumes of wastes. Problems with heavy metal contamination are reported by 35 states. Principal sources are industrial discharges, urban runoff and erosion of metals-rich soils and rock deposits; of these, industrial discharges and urban runoff have greatest effects on water quality. Eighteen states report problems with pesticides in water, sediments and fish tissues; but some states report significant improvements following control programs. Pollution from toxic industrial chemicals is reported by 16 states, including all those around the Great Lakes. Fourteen states expect significant improvements by 1983 under national goals posited in the Water Pollution Control Act Amendments of 1972 (PL 92-500). Although states agree with Federal authorities on a fixed schedule for future U.S. funding of municipal sewage treatment facilities, considerably less agreement occurs on future industrial discharge controls; states which discuss the issue generally do not agree with proposals to allow exemptions from 1977 level treatment requirements of PL 92-500 by the U. S. Environmental Protection Agency. (Harris-Wisconsin)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

LAND AND WATER RESOURCES PLANNING USING GOAL PROGRAMMING,
Iowa State Univ., Ames. Dept. of Civil Engineering.
R. L. Rossmiller, M. D. Dougal, and T. A. Austin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-164189, Price codes: A11 in paper copy, A01 in microfiche. Iowa State Water Resources Research Institute, Iowa State University Completion Report No ISWRRI-95, ISU-ERI-AMES-80010, July 1979. 246 p, 13 Fig, 65 Tab, 66 Ref. OWRT B-060-IA (1).

Descriptors: *Mathematical models, *Land use, *Water resources development, *Iowa, Long-term planning, Irrigation practices, Crops, Water demand, Stock water, Livestock, Land classification, Regional economics, Urbanization, Zoning.

A user-oriented goal programming (GP) model for the utilization of land and water resources for various purposes was developed and applied to a 12-county region in Northwest Iowa. The model encompases both the physical spectrum of supply and demand and the social-institutional-environmental spectrum. The model was developed from an existing computer program that was merged with additional computer code. Model development and constraints are described in detail. The model is input intensive allowing it to be flexible but some of this flexibility is lost due to the incorporation of several constraints. Inputs include run identification data, relative yield potential of corn and soybeans on a land capability class, relative yields, erosion rates, urban and rural residential land use, irrigation, and crop planting scenario. The study area in Northwest Iowa has a low annual rainfall of 25 to 28 inches per year and groundwater is not available in sufficient quantities for many uses. The area encompasses 12.8% of the total area of the state but only 10.2% of the population. Results of model application show that the water resources of the Iowa region are adequate to meet all demands with an investment of approximately one billion dollars for the construction of 24 reservoirs, thousands of wells, miles of pipeline, and several pumping stations. Goal programming was found to be a successful tool in resource planning. (Seigler-IPA)

Descriptors: *Model studies, *Mathematical models, *Planning, *Water resources, *Optimization, Water utilization, Water resources development, Decision making, Management, Methodology, Synthesis, Theoretical analysis, Simulation analysis.

A multiobjective total system model approach to water resources planning was developed by combining three approaches to planning: the Surrogate Worth Trade-off (SWT) method, the TECHCOM approach, and the Utility Analysis approach. The SWT method, a quantitative approach, optimizes a mathematical analytical model by mathematical programming and interacts with decision makers. TECHCOM, a scenario approach, displays and analyzes information to reach the best solution for a large-scale complex system. Utility Analysis, a qualitative approach, interacts directly with decision makers to find preferences for different objectives. The multiobjective-hierarchical structure developed uses the utility approach to coordinate subsystems and hierarchical levels. SWT is used to generate a preferred solution at the highest level and then corresponding Pareto optimal solutions are subsequently determined at lower levels. Using this optimization structure many submodels are developed such as agricultural models, recreational development models, wildlife preservation models, and flooding control models. These models are used in an application of the SWT method to the Maumee River Basin Level-B Study. An analysis of the attributes of overlapping decomposition and coordination is given along with a comparison of the Dantzig-Wolfe decomposition. (Seigler-IPA)

A HIERARCHICAL MULTIOBJECTIVE METHOD FOR WATER RESOURCES PLANNING,
Case Western Reserve Univ., Cleveland, OH. School of Engineering.
S. C. Olenik.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-168966, Price codes: A07 in paper copy, A01 in microfiche. MS Thesis, May 31, 1978. 136 p, 7 Fig, 5 Tab, 44 Ref, 2 Append. OWRT-C-7047(No 6221)(5), 14-34-0001-6221.

Descriptors: *Model studies, *Mathematical models, *Planning, *Water resources, *Optimization, Water utilization, Water resources development, Decision making, Management, Methodology, Synthesis, Theoretical analysis, Simulation analysis.

Hierarchical multiobjective optimization was used in two approaches for the possible combination of the TECHCOM methodology and the Surrogate Worth Trade-off (SWT) methodology for use by decision-makers in water resources planning. TECHCOM has a hierarchical structure (goals, subgoals, social indicators, and action variables) that preserves information at all levels so that alternatives can be analyzed without the loss of lower level information. The SWT method, which solves the standard vector optimization problem where objectives are non-commensurable, can find a preferred solution by finding Pareto-optimal solutions and tradeoffs and using systematic decision-maker input. All that is needed to generate a preferred solution is decision-maker preference input. Two sample integrations of TECHCOM and SWT were tested on a sample problem using the Maumee River Basin Level-B land resources model. One alternative, the mathematical integration alterative integrates the SWT method within the information structure of the TECHCOM goal and subgoal hierarchy. The second alternative, the operational integration alternative, features an iterative process using TECHCOM and SWT in succession. Some of the requirements for use of the combined methodology are given. Usefulness of the combined methodology depends on the complexity of the hierarchy submodels. A major advantage of TECHCOM-SWT is that it eliminates the need for a priori preference information. (Seigler-IPA)

CLASSIFICATION OF WETLANDS AND DEEPWATER HABITATS OF THE UNITED STATES,
Fish and Wildlife Service, Jamestown, ND. Northern Prairie Wildlife Research Center.
L. M. Cowardin, V. Carter, F. C. Golet, and E. T. LaRoe.
Available from the Superintendent of Documents, U. S. Government Printing Office, Washington, DC 20402. Stock No. GPO 024-010-00524-6. Biological Services Program Report No FWS/OBS - 79/31, December 1979. 110 p, 64 Fig, 5 Tab, 120 Ref, 5 Append.

Descriptors: *Classification, *Systematics, *Wetlands, *Wildlife, *Deep-water habitats, Aquatic habitats, Marshes, Estuarine environment, Rivers, Coasts, Aquatic animals, Plant populations, Wildlife habitats, Swamps, Bogs, Deepwater.

The hierarchical classification system used in the 1974 Fish and Wildlife Service inventory of wetlands and deepwater habitats in the United States is described and illustrated from a user oriented approach. The classification system is designed so that it provides uniformity of concepts and terms, and furnishes mapping units. At the highest level of classification five systems are defined: Marine, Estuarine, Riverine, Lacustrine, and Palustrine. Marine and Estuarine systems are divided into two subsystems, Subtidal and Intertidal; Riverine systems into four subsystems, Tidal, Lower Perennial, Upper Perennial, and Intermittent; Lacustrine systems into two, Littoral and Limnetic; while only Palustrine has no subsystem. Classes, within the subsystems, may appear under one or more of the systems or subsystems. These classes are based on substrate material and flooding regime, or on vegetative life form. Necessary for use of the system are the modifying terms applied to the classes or subclasses. Classes and modifying terms are listed. The lowest level of the classification hierarchy used is the dominance type which are named for the dominant plant or animal forms and must be developed by the user of the classification system. GROUND WATER HEAT PUMPS - A COST COMPARISON,
Wilson (Ian D.) Associates Ltd., Barrie (Ontario).
D. Brown.
Canadian Water Well, Vol 6, No 1, p 20, February, 1980. 1 Fig.

Descriptors: *Heat pumps, *Ground water, *Cost comparison, Cost repayment, Costs, Fossil fuels,

Heating, Water wells, Pumping, Maintenance costs, Operating costs, Initial costs, Economics.

The ground water heat pump operates with a constant high efficiency or coefficient of performance (COP) because it taps a source of low-grade heat which is essentially unvariable. The cost of pumping water from a well to the heat pump will vary with water temperature, depth or distance to water, the particular model of heat pump used, and the amount of heat to be supplied. Although the ground water heat pump does cost more than conventional heating systems initially, the savings in operating and maintenance costs make it an economical alternative heating system for both new and old homes, especially with the high price of fuel. THE POTENTIAL FOR DEVELOPING GROUND-WATER SUPPLIES IN THE PESCADERO AREA, SAN MATEO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
J. P. Akers.
Geological Survey Water-Resources Investigations 80-6, January 1980. 8 p, 1 Fig, 3 Ref.

Descriptors: *Groundwater, *Water resources development, *Water supply, *California, *Groundwater availability, Potable water, Water quality, *Pescadero area(Calif), *San Mateo County(Calif).

Adequate supplies of ground water for municipal use generally are not available within a 3-mile radius of Pescadero, San Mateo County, California. The required quantity of 100 gallons per minute probably could be obtained from one or more wells in the alluvium along Pescadero Creek; however, the quality of the water probably would deteriorate with time and might not be suitable for public supply for more than 20 or 30 years. Sand and gravel beds below 60 feet in the alluvium near the junction of Honsinger and Pescadero Creeks offer the best potential for developing domestic water supplies. (Kosco-USGS)

THE EVOLUTION OF WATER QUALITY MANAGEMENT, PART 3,
R. D. Hennigan.
Clearwaters, Vol 9, No 4, p 15-19, December 1979.

Descriptors: *Federal Water Pollution Control Act, *Water pollution control, *Federal legislation, Water permits, Water quality, Administration, Water management(Applied), Toxins, Pesticides, Environmental effects, Hazards, Water quality act.

Water quality management during the period 1972-1977 shifted to a national program of preservation and conservation. As the country got over Watergate, Vietnam, and other large concerns, more and more groups became alarmed about environmental issues. Water pollution became a pressing issue with major disasters such as the finding of PCBs in the Hudson River which resulted in a fishing ban, the dumping of Kepone in the James River, and the discovery of PCB's and Mirex in the Lake Ontario fishery. A high level of public response brought about Federal action mainly in the form of the Federal Water Pollution Control Act amendments (PL 92-500), one of the most complex and comprehensive measures ever enacted by Congress. The act applied to all United States waters and made the Environmental Protection Agency (EPA) the authority for implementing the act which was designed 'to restore and maintain the chemical, physical, and biological integrity of the Nation's waters.' To implement the act various mechanisms were used such as four levels of planning, permits, construction grants, legal sanctions, and citizen action. Other acts were also implemented to help such as the Safe Drinking Water Act; Marine Protection, Research and Sanctuaries Act; Toxic Substances Control Act. The 1972 act had many deadlines for EPA that have since been revised. As a result of the act a great deal of improvement occurred in the Nation's waters. This progress continued as the era ended with the 1977 amendments to the original act. (Seigler-IPA)

A REGULATED CITIZEN'S BILL OF RIGHTS,
National Oceanic and Atmospheric Administration, Washington, D.C.
R. R. Gardner.
Coastal Zone Management Journal, Vol 3, No 1, p 1-5, 1976.

Descriptors: *Public rights, *Water management(Applied), *Coasts, Water policy, Permits, Coastal engineering, Developed waters, State governments, Administrative agencies, Environmental control.

Coastal zone management has become a significant area of concern at all levels of government. In times of increasing environmental and economic progmatism, coastal management programs may be perceived as a function of big government and/or antithetical to development. In order to suceed in today's environment, coastal zone management programs need general public support. To ensure the support of the average citizen, each coastal zone management program should include in its policy statement the following points: (1) comprehensive, rational regulations that can be understood by the public; (2) simple regulatory procedures whereby regulated activity is not subjected to undue inconvenience; (3) reasonable costs of application; (4) timely decisions on applications within a time specified at the time of application; (5) negotiated settlements between applicants and the regulatory agency; (6) appeals from regulatory decisions; (7) equity of treatment; and (8) courteous treatment by all members of the regulatory body. MINING RIGHTS AND THE GENERAL INTERNATIONAL LAW REGIME OF THE DEEP OCEAN FLOOR,
Syracuse Univ., NY.
L. F. E. Goldie.
Brooklyn Journal of International Law, Vol 2, No 1, p 1-69, Fall 1975.

Descriptors: *Law of the sea, *International law, *Resources development, United Nations, International commissions, Mining, Mineral industry, International waters, Legal aspects, Subsoil, Oceans, Usufructuary right.

The sessions of the Third Law of the Sea Conference have ended inconclusively, with no regime settled for the implementation of mining rights to the ocean floor. At present, customary international law provides for the taking of nodules from the high sea beds. While the high seas are common to all nations and cannot be appropriated, the wealth they contain can become the object of proprietorship. International law has developed only hazy concepts of possessory, usufructuary, and exclusive rights with respect to moveable property. Mining rights concepts, which enjoy acceptance in domestic law, were tried on the international level on the island of Spitybergen prior to the treaty of Paris. A similar kind of regime could emerge as a special seabed custom. The United Nations has declared a moratorium on exploitation of the ocean floor beyond the limits of national jurisdiction, pending the establishment of an international regime. The absence of any effective prohibitory rule for this resolution makes a clarification of mining rights of even more importance. (Wilson-Florida)

REMOTE SENSING EVIDENCE AND ENVIRONMENTAL LAW,
Rutgers-The State Univ., Newark, NJ. School of Law.
H. A. Latin, G. W. Tannehill, and R. E. White.
California Law Review, Vol 64, No 6, p 1300-1446, December 1976.

Descriptors: *Remote sensing, *Environmental control, *Monitoring, Legal aspects, Federal water pollution control act, Regulation, Strip mines, Administrative agencies, Water pollution, Reliability, Satellites(Artificial).

Remote sensing is the generic label applied to the technology designed to collect information about the earth's physical properties. The typical remote sensing application employs some form of aerial or satellite reconnaissance to measure and record environmental phenomena from a distance. To date, no accessible judicial or administrative opinion presents a comprehensive analysis of the utility and admissibility of remote sensing information. This information is relevant in the implementation of various natural resources and environmental programs. Two examples are in regard to the enforcement of water pollution controls, and in the control of strip mining. Remote sensory information can be utilized in investigatory and policy planning contexts, to determine conformance with regulatory standards and to document probable cause. In order for remote sensing output to be accepted in courts, the information must comply with formal rules of evidence. The submission strategy probably will parallel that employed for most types of scientific evidence. Thus the information will be in the form of expert testimony, and must pass basic legal tests for reliability. (Wilson-Florida)
W80-04468

A RECIPE FOR BAD WATER: WELFARE ECONOMICS AND NUISANCE LAW MIXED WELL,
Franklin Thomas Backus Law School, Cleveland, OH.
P. D. Junger.
Case Western Reserve Law Review, Vol 27, No 1, p 3-335, Fall 1976.

Descriptors: *Federal water pollution control act, *Economic impact, *Economic justification, Federal government, Legislation, Water pollution control, Legal aspects, Economic impact, Water quality, Ecology, Environmental control.

The 1972 Federal Water Pollution Control Act Amendments represent the first comprehensive modern attempt to achieve an effective scheme for water pollution control at the federal level. Passage of the Amendments and the increasing interest shown in interdisciplinary studies in law and economics suggest that lawyers will be confronted with the argument that implementation of the Amendments will be too costly. Under the doctrine of welfare economics, an optimal economic state can be reached, if the world behaved like an economic model of an efficient market. This theory should not apply to pollution control which is basically a moral question. The claim of excessive cost in cleaning our water cannot be ethically

or practically supported. Traditional nuisance law has been ineffective as a means of reducing water pollution. Nuisance law, both public and private, is a conflicting morass of doctrines which represents efforts to deal with individual situations rather than to provide clarity in defining legal rights. Failure to implement the Amendments will result in excessive water pollution, even if one accepts the premises of welfare economics. (Wilson-Florida)

DON'T LET POLITICS PROSCRIBE CLIMATIC RESEARCH,
Scripps Institution of Oceanography, La Jolla, CA.
W. A. Nierenberg.
Ceres, Vol 11, No 6, p 23-25, November-December, 1978.

Descriptors: *Research priorities, *International waters, *Weather forecasting, Weather data, Weather modification, Conferences, Fisheries, Research and development, International commissions, Climates, Climatic data.

Air-Sea Interaction, a new discipline, is being pursued by many nations worldwide. The ocean's role in climate change is important to understand, as such changes could have serious effects upon fishery resources. The Law of the Sea negotiations, begin in 1973, could have some bad effects in this area. The two major issues of this conference were ownership of fishery resources and mineral wealth. The former was rendered moot when Congress passed the Fisheries Conservation Act, giving United States fisheries control over a 200 mile contiguous zone. The latter issue will be surmounted when unilateral full-scale mining action is undertaken by a national company. The result of the negotiations could be an effort to restrict scientific research. Permission to conduct research must be obtained from the controlling nation and there is no method of appeal or arbitration. The negotiations must take a new direction and attempt to lighten political restraints on research. (Tabano-Florida)

THE PROTECTION OF HYDROLOGIC AND LAND PRESERVATION VALUES UNDER THE SURFACE MINING CONTROL AND RECLAMATION ACT OF 1977: A WELCOME REFORM,
Appalachian Research and Defense Fund, Inc., Charleston, WV.
D. Wooley.
West Virginia Law Review, the National Coal Issue, Vol 81, No 4, p 627-670, 1979.

Descriptors: *Strip mining, *Strip mine wastes, *Surface runoff, *Soil conservation, Water pollution control, Land fills, Public rights, Sediment control, Land use, Government finance, Governmental interrelations, Hydrology.

The 1977 Surface Mining Control and Reclamation Act (Act) is evaluated in the context of West Virginia's 1971 Surface Mining and Reclamation Act. The federal Act is viewed as an improvement over state legislation in the following areas: (1) protection of hydrologic balance; (2) prevention of water contamination; (3) design of sediment ponds and water impoundments; and (4) conservation of topsoil and revegetation. Several land use considerations are also discussed in relation to the federal Act. The public participation aspects of the Act are outlined in a typical scenario. The Act should improve state enforcement mechanisms of strip mining laws, especially through financial assistance to upgrade the state programs. An interim program was put into effect while the state legislation was being upgraded. Problems arising between the state and federal agencies during this interim are briefly discussed. The fate of effective regulation is not good as the state has committed itself to the industry's view of the Act. The state and federal agencies must settle their differences in favor of effective implementation. (Tabano-Florida)
W80-04471

WATER QUALITY COMMITTEE-ANNUAL REVIEW OF SIGNIFICANT LEGISLATURE, JUDICIAL AND ADMINISTRATIVE, ACTIVITIES DURING 1977.
American Bar Association, Washington, DC. Natural Resources Law Section.
Natural Resources Lawyer, Vol 11, No 1, p 234-266, 1978.

Descriptors: *Water quality standards, *Water pollution control, *Administrative agencies, Legislation, Water quality, Federal Government, Judicial decisions, Effluents, Water law, Regulation.

In 1977, the federal courts rendered a large number of decisions interpreting provisions of the Federal Water Pollution Control Act (FWPCA). These cases involved the need for plans for pollution control under Section 208, review of effulent limitations and discharge permits, enforcement of the FWPCH requirements by the federal Environmental Protection Agency (EPA) and the citizens' groups and other issues involving private dischargers. Decisions dealing with the construction and funding of publically-owned treatment works are omitted. Significant EPA proposed regulations under the FWPCA, the Safe Drinking Water Act, and the Maine Protection, Research and Sanctuaries Act. These included National Secondary Drinking Water Regulations and regulations dealing with construction grants, effluent limitations, and toxic pollutant standards. Congress passed lengthy amendments to the FWPCA known as the Clean Water Act. Practically no major provision of FWCPA was left untouched. Changes were made to the construction grants program, Section 208 (water quality management and planning) requirements for industries, the control of toxic water pollutants, and Section 404 (the regulation of the discharge of dredged or fill material) among others. (Wilson-Florida)
W80-04472

DISPUTE SETTLEMENT IN THE LAW OF THE SEA CONVENTION: THE MILITARY ACTIVITIES EXCEPTION,
M. W. Janis.
Ocean Development and International Law Journal, Vol 4, No 1, p 51-65, 1977.

Descriptors: *Law of the sea, *Military aspects, *International law, Negotiations, Conferences, United nations, International commissions, Law enforcement, Legal aspects, Treaties.

The most concrete result of eight years of Law of the Sea negotiations is the Informal Single Negotiating Text. The Text consists of three substantive parts and a fourth part concerning dispute settlement. A party may ratify the Text but not accept some or all of the procedures for dispute settlement in specific categories. Article 18, Section 2(c) contains an exception to dispute settlement procedures concerning military activities, it being understood that law enforcement activities pursuant to the Law of the Sea Convention shall not be considered military activities. Military activities have been one of the maritime interests which the great powers have been particularly diligent in protecting. Although the exception seems to favor naval powers, in practice it would not. The emerging rules of the Law of the Sea are favorable to naval operations. It is more likely that the military activities exception would be used by coastal states resisting superpower naval activities. Thus the exception will remove activities from dispute settlement procedures which are almost certainly in need of peaceful resolution. (Wilson-Florida)
W80-04474

JURISDICTIONAL AND ADMINISTRATIVE LIMITATIONS AFFECTING MANAGEMENT OF THE HALIBUT FISHERY,
International Pacific Halibut Commission, Seattle, WA.
B. E. Skud.
Ocean Development and International Law Journal, Vol 4, No 2, p 121-142, 1977. 1 Tab, 32 Ref.

Descriptors: *United States, *Canada, *Fisheries, *International law, Fish, Fishing, Treaties, International commissions, Fish populations, Legislation, Foreign countries.

The International Pacific Halibut Commission, created by the 1923 Canadian-United States Halibut Convention, has managed the halibut fishery for these two countries for more than 50 years. Under the Convention and its subsequent revisions, the parties agreed among other things, to divide the waters into areas, to establish seasons, to limit catches, and make necessary regulations. The Convention has not been revised since 1953, and there is a question whether the Commission can effectively manage the fishery under existing guidelines. During the past 25 years, significant changes have occurred in the international fishery scene, with the extension of the fishery zone to 12 miles, and the imminent implementation of a 200-mile limit. National goals such as limited entry and optimum yield have not been incorporated in the terms of the existing Convention. These inconsistencies, as well as administrative deficiencies, have limited the effectiveness of the Commission. A revision of the present treaty and associated legislation is recommended. Suggestions are made for the restructuring of international arrangements now under study by the federal governments. A reference list is included. (Wilson-Florida)

THE IDAHO WATER PLAN: TWO THRESHOLD CONSTITUTIONAL PROBLEMS AND SUGGESTED SOLUTIONS,
Idaho Univ., Moscow.
D. L. Grant.
Idaho Law Review, Vol 15, No 3, p 443-507, Summer 1979.

Descriptors: *Idaho, *Water resources development, *Water management(Applied), Water resources, Water permits, Appropriation, Agencies, State governments, Water rights, Governmental interrelations, Constitutional Law.

The recent development of the Idaho water plan is a milestone in an ambitious state water resource development and management program. The development of a state water plan grew out of efforts by other western states and by the Department of the Interior to implement water programs which might direct Idaho's water resources. Two constitutional issues are of major importance in carrying out the Idaho plan. The first is one of intragovernmental relations, namely, the proper roles of the Idaho Legislation and the Idaho Water Resource Board in setting state water policy. The Idaho Constitution gives the Board power to implement a plan under such laws as may be prescribed by the legislature. Litigation has arisen over the extent of the Board's powers. The second issue involves the state's power to prohibit new appropriations which conflict with the objectives of the state water plan. The basic question is whether the disapproval of new appropriations on the ground of conflict with the public interest is contrary to the Idaho Constitution, which assures the right to appropriate waters. (Wilson-Florida).

NO WATER FOR THE WOODS: A CRITICAL ANALYSIS OF UNITED STATES V. NEW MEXICO,
California Univ., Berkley.
S. K. Fairfax, and A. D. Tarlock.
Idaho Law Review, Vol 15, No 3, p 509-554, Summer 1979.

Descriptors: *Forest management, *Federal-state water rights conflicts, *Water allocation(Policy), Water resources, Legal aspects, Land management, Federal reservations, Reclamation legislation, Judicial decisions.

United States v. New Mexico, decided in 1978, is the first Supreme Court opinion to confront directly the following questions: When may a federal land management agency assert the implied intent of Congress to reserve appurtenant water rights, when public land is withdrawn from entry. The majority of the Supreme Court decided that the Forest Service could not claim reserved rights for

the preservation of instream flows, recreation, and stockwatering. At issue was the implied intent of Congress in passing the 1891 Creative Act and the 1897 Organic Administration Act. An alternative reading of the two acts and other relevant legislation suggests that the 1891 Act authorizing forest reservations was intended to preserve the forests, and that the 1897 Act did not significantly alter the 1891 legislation. From this legislative interpretation, the Court's construction of the two acts is arguably wrong because the reservation of water for instream uses is consistent with the original reserve purposes. The decision also creates future federal-state water conflicts arising out of reserved right claims by federal land managers. (Wilson-Florida)

AN EQUITABLE REGIME FOR SEABED AND OCEAN SUBSOIL RESOURCES,
New York Univ., NY. Center for International Studies.
T. M. Franck, T. M. Kennedy, and C. V. Trinko.
Denver Journal of International Law and Policy, Vol 4, No 2, p 161-186, Fall 1974.

Descriptors: *Law of the sea, *International law, *Resources development, Oceans, United Nations, Treaties, Natural resources, Subsoil, International waters, Jurisdiction, Mining.

Ocean mineral resources are the world's last great new frontier in an era of massive mineral consumption and predictable mineral shortages. A strategy is needed for the implementation of an equitable regime for the allocation of the seabed and the ocean subsoil. The United Nations Seabed Committee has begun work drafting a treaty establishing an international regime for the exploitation of the seabed. This effort has been closely linked to the problem of defining the area subject to national jurisdiction. An equitable principle applicable to the seabed and subsoil can be formulated as follows: No state should be permitted to extend its jurisdiction over seabed and subsoil resources without sharing the benefits with the rest of the international community in accordance with each member's need. Revenue sharing, rather than a division of jurisdiction and multiplicity of operating authorities, has the advantage of simplicity and acceptability to coastal states. Advantages of an equitable sea regime include: (1) avoiding the potential conflict of a race for ocean space; (2) making international aid a multilateral undertaking; (3) establishing an international administration to protect the freedom of the high seas beyond national jurisdiction. (Wilson-Florida)

INTERNATIONAL RAMIFICATIONS OF THE FISHERY CONSERVATION AND MANAGEMENT ACT OF 1976,
D. R. Christie.
Georgia Journal of International and Comparative Law, Vol 7, No 1, p 133-147, 1977.

Descriptors: *Law of the sea, *International law, *Marine fisheries, Fisheries, Conservation, Legislation, Foreign countries, International waters, United nations, Water law, Marine fish.

On April 13, 1976, President Ford signed the Fishery Conservation and Management Act (Act). This Act established a 200 mile fishery conservation zone over which the United States (U.S.) will exercise exclusive fishery management. The U.S. became the first major power to declare unilaterally a 200 mile exclusive fisheries zone. Many experts expressed doubts as to the legality of these exclusive zones under international law. Other issues to be faced by the U.S. in the implementation of the Act include: (1) prior treaty obligations and negotiations; (2) stress on relations with the Soviet Union, Japan and Latin America; (3) a rash of unilaterally declared zones which exceed the Fisheries Act; and (4) enforceability. The adoption of a 200 mile exclusive zone by the United States made unilateral extension an acceptable concept. The result has been a virtual 'sea-grab' by coastal nations. The successful extension of these zones may lessen the incentive to reach agreement at the Law of the Sea Conference. (Wilson-Florida)

TOWARD THE MAXIMIZATION OF A RESOURCE: THE 1971 WASHINGTON WATER RESOURCES ACT,
S. R. Pruzan.
Gonzaga Law Review, Vol 9, No 3, p 759-779, Spring 1974.

Descriptors: *Washington, *Water resources, *Water allocation(Policy), Base flow, Legislation, Hydrology, Water law, Administrative agencies, Riparian rights, Economics, Water conservation.

The 1971 Washington legislature enacted the Water Resources Act (Act). Under this legislation, the Washington State Department of Ecology must promulgate regulations to preserve and use water in a manner which will promote the 'public health and economic well being of the state and the preservation of its natural resources and aesthetic values.' The Act does not supersede the 1917 Water Code or other established legislation. The Act was needed because the improper use of water resources in Washington has led to a multitude of problems. To a great extent, pre-Act law, the lack of adequate hydrologic data, and the absence of sound economic theory are responsible for this inefficient use. Maximization of benefits under the Act will be established by base flow requirements, with ample consideration of recreation, fish and wildlife. Washington's allocation system will also be revamped. Maximum net benefits mean increased water transferability and the promulgation of regulations to protect purchases and encourage sales. (Wilson-Florida)

TRANS-BOUNDARY POLLUTION INJURIES: JURISDICTIONAL CONSIDERATIONS IN PRIVATE LITIGATION BETWEEN CANADA AND THE UNITED STATES,
S. C. McCaffrey.
California Western International Law Journal, Vol 3, No 2, p 191-259, May 1973.

Descriptors: *Water pollution effects, *Remedies, *Canada, *United States, Treaties, Legal aspects, Pollutants, International Joint Commission, Jurisdiction, International law, Boundaries(Surfaces).

Burgeoning industrialization in the past half-century has increased the probability that nations will injure each other through the medium of shared natural resources. Treating every private injury by trans-boundary pollution as an international tort will do little to further the .cause of harmony among nations. The importance of dealing with pollution problems regionally is well recognized, by tailoring specific preventive, regulatory or remedial measures to the air or watersheds concerned. Most natural resource problems arising along the Canadian-American boundary have been dealt with under the 1909 Boundary Waters Treaty or through the International Joint Commission which the Treaty created. Although air and water pollution problems have recently received much attention, the 1909 Treaty primarily focuses on navigation and diversion of waters. The Treaty does create private rights for extraterritorial injuries caused by diversion of water, but does not explicity address remedies for pollution injuries. The principal problem for plaintiffs suing under common law actions for injuries has been jurisdictional. The plaintiff must either sue in the defendant's country or encounter problems getting the defendent into court in the plaintiff's country. (Wilson-Florida)

COASTAL ZONE MANAGEMENT AND EXCLUDED FEDERAL LANDS: THE VIABILITY OF CONTINUED FEDERALISM IN THE MANAGEMENT OF FEDERAL COASTLANDS,
National Oceanic and Atmospheric Administration, Washington, DC.
M. E. Shapiro.
Ecology Law Quarterly, Vol 7, No 4, p 1011-1043, 1979.

Descriptors: *Federal-State Water Rights Conflicts, *Coasts, *Resources development, Legislation, State jurisdiction, Federal jurisdiction, Management, Water law, Administrative agencies, Water resources.

The 1979 Coastal Zone Management Act (CZMA) as amended authorizes a national program for the management, beneficial use, protection, and development of the natural resources in the nation's coastal zone. One goal of the Act is to encourage coastal states to exercise their full authority over the coastal zone resources. In defining coastal zone, Congress included a significant and controversial exception. Section 304(1) of the CZMA excludes from coastal zones those lands the use of which is subject to the discretion of or which is held in trust by the Federal Government. Many coastal states have argued that their ability to plan for and adequately manage their coastal resources has been seriously hampered by this exclusion of federal coastlands. However, under the federal consistency provisions of the CMZA, a state may influence management of federal coastlands to the extent federal land activities affect resources within the state's coastal zone. Federal agencies and the courts have differed over the interpretation of the relevant provisions of the Act. To ensure a viable, continuing federalism in the management of federal coastlines, the states must exercize their full range of powers in a manner that will both serve state goals and recognize the unique national interests associated with federal coastlines. (Wilson-Florida)

RECLAMATION LAW CONSTRAINTS ON ENERGY/INDUSTRIAL USES OF WESTERN WATER,
Environmental Defense Fund, Denver, CO.
G. W. Pring, and L. Edelman.
Natural Resources Lawyer, Vol 8, No 2, p 297-306, 1975.

Descriptors: *Reclamation, *Agricultural watersheds, *Water allocation(Policy), Energy, Agriculture, Industrial water, Water resources, Water policy, Administration, Resevoirs, Water demand.

The massive energy resources of the Western states have great potential for development. The various methods of energy conversion and transportation of energy resources will require enormous quantities of water - one of the region's scarcest resources. Even where available, water supply may quickly be exceeded by demand, creating conflicts between water needs for energy and for other uses, particularly agriculture. With increasing frequency, federal water storage projects are undergoing a changeover from agriculture to energy/industrial supply. As early as 1967, the Bureau of Reclamation began contracting to deliver large quantities of water to energy industries. However, there are legal constraints on western water use for energy. These limitations arise first under the federal reclamation laws. Bureau of Reclamation's authority to provide industrial water must be found both in the organic reclamation laws and within specific enabling legislation for the project from which the industrial water would be supplied. The apparent conflicts of existing law contain potential for legal challenge. These issues must be resolved before further contracting or delivering. The courts and the Congress should take the lead in this endeavor. (Wilson-Florida)
W80-04483

WATER QUALITY COMMITTEE (ANNUAL REVIEW OF ACTIVITIES - 1975).
American Bar Association, Washington, DC. Natural Resources Law Section.
Natural Resources Lawyer, Vol 9, No 2, p 311-318, 1976.

Descriptors: *Potable water, *Water quality standards, *Waste water(Pollution), Legislation, Public health, Water law, Water quality control, Judicial decisions, Effluents, Radioactive wastes.

In December, 1974, Congress passed the Safe Drinking Water Act (Act). Under this Act, the

federal Environmental Protection Agency (EPA) is directed to establish primary and secondary drinking water standards. The Act is applicable to public water systems, defined as a system for providing piped water with at least 15 service connections or for at least 25 individuals. Regulations are provided for state underground injection control programs which are of most concern to the oil and gas industry. The states are the primary enforcers of the Act. If the state has not developed an enforcement plan satisfactory to the administrator of the EPA, the administrator may take action. In 1975, approximately 400 court cases were filed concerning the interpretation of the Act's provisions. The issues dealt with by the more significant decisions included: (1) effluent limitations; (2) thermal discharge variances; (3) toxic substances and pre-treatment standards; (4) the NPDES permit program; (5) dredge and fill permit program; (6) areawide waste management planning; (7) regulation of radioactive waste discharges; and (8) construction grants program. (Wilson-Florida)

NOAA'S MARINE SANCTUARY PROGRAM,
National Oceanic and Atmospheric Administration, Rockville, MD. Coastal Zone Management Office.
R. R. Kifer.
Coastal Zone Management Journal, Vol 2, No 2, p 177-188, 1975.

Descriptors: *Wildlife management, *Federal project policy, *Preservation, Coasts, Legislation, Protection, Water law, Marine animals, Federal jurisdiction, Oceans, Environmental effects.

Authority to designate marine sanctuaries was established by Title III of the 1972 Marine Protection, Research, and Sanctuaries Act (Act), as the ocean water counterpart to our National Parks and Seashores. Responsibility for implementing the marine sanctuary program was delegated to the Office of Coastal Zone Management (OCZM) of the National Oceanic and Atmospheric Administration. A sanctuary may have a designation in any of the following areas: (1) habitats; (2) species; (3) recreational and aesthetic; (4) research; and (5) unique. A nomination for marine sanctuary designation may come from any individual, organization, or governmental body. A nomination is processed by the OCZM with public participation. The Act requires consultation with both state and federal agencies. An environmental impact statement is also required. The process culminates in sanctuary designation. The day-to-day operations of the sanctuary are covered in part by the Act, including both surviellance and protection. The Act provides for prosecution of violators. (Wilson-Florida)

THE WINTERS DOCTRINE ON RESERVED WATER RIGHTS IN IDAHO: AVONDALE IRRIGATION DISTRICT V. NORTH IDAHO PROPERTIES, INC.,
B. Palmer.
Idaho Law Review, Vol 15, No 3, p 591-603, Summer 1979.

Descriptors: *Idaho, *Reservation doctrine, *National forests, *Federal-state water rights conflicts, Federal reservations, Wildlife conservation, Fish conservation, Legislation, Natural resources, Indian reservations, Water allocation(Policy).

This note concerns two recent cases which addressed questions relating to federal reserved water rights on national forest land in Idaho. At issue was whether Idaho law required the federal government to specifically quantify its water needs for national forest purposes, and if so, whether reservation of the entire natural flow of streams in national forests was specific enough quantification to satisfy that requirement. Both cases involved the application of the Winters Doctrine. Under this doctrine, whenever the federal government reserves land from the public domain, it also impliedly reserves rights to water not previously appropriated which is necessary for the fulfillment of its purpose of the reservation. The Idaho Supreme Court concluded that the reservation of water for forests in each case was specifically reserved for the limited purposes of 'preserving a perpetual supply of timber and protecting watersheds to secure favorable conditions of water flows.' Fish and wildlife preservation, recreation, and aesthetics were found not to be proper purposes for reserving water for national forest land. Federal water rights under the specific quantification statute must fall within the limited defined purposes. (Schwerer-Florida)

IMPACT OF THE 1977 CLEAN WATER ACT AMENDMENTS ON INDUSTRIAL DISCHARGERS,
Morgan, Lewis and Bockius, Washington, DC.
J. Quarles.
Environmental Reporter, Vol 8, No 46, Monograph No 25, March 17, 1978. 12 p.

Descriptors: *Waste water treatment, *Water quality standards, *Federal Water Pollution Control Act, *Industrial plants, Waste water, Pollutants, Discharge(Water), Water pollution control, Legislation, Water pollution sources, Regulation, Administrative agencies.

The 1977 Clean Water Act (1977 Act) comprehensively amended the 1972 Federal Water Pollution Control Act. Under the 1977 Act companies not in compliance with the 1977 requirements may obtain a limited extension of the compliance deadline. The 1977 Act substantially revises the standards for best available technology control, previously scheduled for completion by 1983. Variances from the requirements for control of nonconventional pollutants are permitted under specified conditions. The regulatory framework is expanded by authorizing the federal Environmental Protection Agency to issue regulations to control and restrict the runoff of toxic and hazardous materials. Provisions for noncompliance fees were not included in the legislation as finally enacted. The pretreatment requirements are modified to provide discharges credit for any removal of toxic pollutants by a municipal sewage treatment plant. As a consequence of this prospect, companies may wish to reconsider the advantages of tieing into a municipal system. (Wilson-Florida)

DEMORALIZED WETLANDS OWNERS: IS THERE JUST COMPENSATION AFTER BRECCIAROLI V. CONNECTICUT COMMISSIONER OF ENVIRONMENTAL PROTECTION.,
R. W. Reeves.
Connecticut Bar Journal, Vol 53, No 1, p 60-72, February 1979.

Descriptors: *Wetlands, *Connecticut, *Legislation, *Land use, Judicial decisions, Regulation, Environmental control, State governments, Water law, Tidal marshes, Administrative agencies.

In 1971, the Connecticut Commissioner of Environmental Protection designated as tidal wetlands property owned by Dante Brecciaroli. The statutory authority for the action was the Tidal Wetlands Act. This is one of two Connecticut statutes dealing with the preservation of wetlands, the other is the Inland Wetlands Act. Under either act an owner of property designated as wetlands can conduct no 'regulated activity' on the property without a permit. This term essentially encompasses all those uses which an average landowner might want to conduct on his land. Mr. Brecciaroli applied to the Commissioner for a permit to fill-in 5.3 acres of the wetland area. Following a hearing, this application was denied, this judgment being affirmed by the Connecticut Supreme Court. The Brecciaroli decision exemplifies a weakness in the wetlands regulatory scheme: an ever-increasing procedural burden is placed upon owners of wetlands who desire to conduct some reasonable use on their properties. The decision also raises the question of when and how a landowner ought to be compensated for the effects of land-use regulation. (Wilson-Florida)
W80-04488

OIL SPILLS - STATE PREVENTION AND THE POSSIBILITY OF PRE-EMPTION,
S. R. Armstrong.
Mercer Law Review, Vol 30, No 2, p 559-572, Winter 1979.

Descriptors: *Washington, *Oil spills, *Water pollution control, Federal government, Environment, Environment controls, Legislation, Shore protection, Coasts, Oil, Transportation.

The likelihood of oil spills and related accidents has caused concern to coastal states. A state legislature's problems in seeking to balance energy demands with environmental concerns are complicated by federal environmental regulation. Confronting these conflicting interests the Washington State Legislature passed the 1975 Washington Tanker Law (Act). A case challenging the constitutionality of that law, Ray v. Atlantic Richfield Co. (Ray) is analyzed. The development of the doctrine of federal pre-emption is discussed. The use of the doctrine of federal pre-emption in the Ray case is examined. The court's ruling invalidated certain provisions of the Act - the pilot licensing and the safety and design features among others, but upheld other provisions. There is a discussion of alternative methods of balancing the need for energy against the potential hazards of oil transportation. Among the alternatives discussed are state acts which protect the environment by providing for damages after-the-fact. This would protect a state's environment while avoiding the chances of federal pre-emption. (Daniels-Florida)
W80-04489

THE IRRIGATION REVOLUTION AND ITS ENVIRONMENTAL CONSEQUENCES,
J. Aucoin.
Environment, Vol 21, No 8, p 17-20, 38-40, October 1979.

Descriptors: *Nebraska, *Irrigation systems, *Erosion, *Groundwater recharge, Water table, Water quality, Water pollution, Environmental effects, Groundwater, Groundwater availability, Water resources, Irrigation.

The center pivot irrigation system is examined as to its good features and the environmental consequences for its use. The effect of this system in Nebraska is emphasized. The advantages over other systems are briefly discussed. About a third of the irrigated acres in Nebraska are serviced by center pivot systems and this percentage is growing. The problems associated with this increase in acreage serviced by this system are analyzed. These include land erosion and a vanishing water table. Actions taken to combat these growing problems are discussed. Related to the water quantity questions are the problems of water quality. Pollution of groundwater associated with use and reuse of the same water is explored. Conflict of interests between local communities benefited by the increase in center pivot irrigation system's use and state officials and environmentalists are discussed. Whether Nebraska and other plains states can avoid destruction of their necessary resources is still unresolved. (Daniels-Florida)

PRESCRIPTIVE ADMINISTRATIVE PROPOSAL: AN INTERNATIONAL MACHINERY FOR CONTROL OF THE HIGH SEAS,
Virginia Univ., Charlottesville. Inst. of Government.
N. D. Joyner, and C. C. Joyner.
International Lawyer (A.B.A.), Vol 8, No 1, p 57-73, January 1974.

Descriptors: *Inter-agency cooperation, *International law, *Fisheries, Administration, Administrative agencies, United Nations, Coordination, International waters, Fishing, Oceans, Administrative decisions.

An administrative model for international control of the high seas is proposed. Increasing reliance on resources from the sea, especially fish, present reasons for encouraging international cooperation in regulating fisheries on the high seas. The history of

international administrative control over this area is examined. There is a brief summary of the ocean-related functions of seven major United Nations agencies (U.N.) whose organizational goals include a concern for research and development of the ocean environment on an international level. An analysis of the hierarchy of United Nation's functional agencies is included. Prescriptive proposals for the reorganization of the U.N. marine-oriented agencies are presented, with an explanation of the proposed hierarchy for international high seas control. Methods to expedite international control of the high seas are briefly discussed. To be successful, the proposed administrative machinery for control of the high seas requires: (1) rational analysis of the framework of existing U.N. marine-oriented agencies; and (2) a realization of the realities of international power politics combined with existing modes of coping with marine environmental problems. (Daniels-Florida)

MODEL COASTAL ZONE STATUTE,
N. Smith, P. Ratner, and A. MacBeth.
Coastal Zone Management Journal, Vol 1, No 2, p 209-225, Winter 1974.

Descriptors: *Zoning, *Coasts, *Shore protection, *Model studies, Resources development, Permits, Programs, Planning, Legal aspects, State governments, Natural resources, Conservation.

This model coastal zone management statute provides a possible state response to the federal 1972 Coastal Zone Management Act. The statute is designed to provide a general plan conforming to specific requirements of the federal Act which may be adapted to specific requirements of individual states. The model statute was written with the intention that all or parts of it could be adapted to the wide variety of state regulatory schemes with the aim of providing unitary management. A Coastal Zone Commission is created with a two-part jurisdiction consisting of the shore area and the larger coastal zone. The Commission will plan, regulate and assume certain functions of existing state agencies, with final responsibility for authorizing development within the coastal zone. Centralized control is a major promise of the statute. The Commission must prepare a coastal zone plan, which will serve as a basis for zoning and permit regulation. Once the plan is in effect, a permanent system of regulation reflecting a different balance of interests for the shore area and the larger coastal zone will be established. (Daniels-Florida)
W80-04492

SOCIAL EQUITY IN COASTAL ZONE PLANNING,
California Univ., Berkley.
T. Dickert, and J. Sorensen.
Coastal Zone Management Journal, Vol 1, No 2, p 141-150, Winter 1974. 1 Tab.

Descriptors: *Coasts, *Zoning, *Decision making, *Social impact, Equity, Social values, Resources, Standards, Resource allocation, Resource development, Land use.

A list is presented of social-economic impacts that coastal zone decision-makers should consider, either when developing coastal policies or when reviewing proposed projects in the coastal zone. A checklist is developed to relate the socio-economic impacts identified to information and methods necessary for impact assessment. The present emphasis of coastal planning on environmental protection and economic development fails to give broader consideration to social equity and social values. This inadequate consideration of social values means many policies developed for environmental protection or economic development of coastal resources may be socially regressive. The objectives of most coastal planning programs are listed. Problems are outlined which will be encountered in the attempt to include social equity considerations in coastal planning. A process is offered which can provide for the consideration of social impacts in a coastal planning program and resolve some of the problems outlined. (Daniels-Florida)
W80-04493

COASTAL STATES ORGANIZATION: THE PAST AND FUTURE,
Coastal States Organization, Charleston, SC.
J. A. Timmerman, Jr.
Coastal Zone Management Journal, Vol 1, No 1, p 119-122, Fall 1973.

Descriptors: *State governments, *Shore protection, *Coasts, Federal government, Resources development, Conferences, Organization, Oceanography, Legislation, Research and development.

A major recommendation of the Stratton Commission to the President in 1968 called for the federal government and the coastal states to collectively create a mechanism to better manage their coastal resources. In November 1968, the first conference ever held among the maritime states was convened in Miami by the Governor of Florida and the Florida Commission on Marine Sciences and Technology. Another meeting was held by representatives of 22 coastal states in Savannah, Georgia in 1970. At this meeting provisional articles of organization were drawn up and a resolution was passed recommending the articles be submitted to the respective states for adoption. The Coastal States Organization (CSO) is open to those states or commonwealths having an ocean, gulf, or Great Lakes Boundary. Among its responsibilities, the CSO contributes to the development of common policy regarding national coastal management legislation and programs. Its major accomplishment to date has been aiding the passage of the 1972 Federal Coastal Zone Management Act. CSO's primary aim for the future should be to focus attention on the National Coastal Zone Management Program and Coastal Zone Research and Technical Services Program. (Wilson-Florida)
W80-04494

ENVIRONMENTAL PROTECTION MOTIVATION IN COASTAL ZONE LAND-USE LEGISLATION,
Conservation Foundation, Washington, DC.
S. Zwicky, and J. Clark.
Coastal Zone Management Journal, Vol 1, No 1, p 103-108, Fall 1973.

Descriptors: *Shore protection, *Land use, *Coasts, *Land development, Flood plains, Wetlands, Legislation, Environmental control, Land management, State governments, Ecosystems, Coastal plains.

The coastal environment is particularly sensitive to the adverse impacts of development. Recognizing that traditional land controls do not provide the needed coastal zone protection, many states have enacted special land-use legislation aimed in part at preserving natural values in coastal areas. Seventeen of the 30 coastal states have substantive coastal zone land protection laws. The four purposes cited most frequently among laws of these 17 states were: (1) protection of wildlife and fisheries; (2) protection of ecosystems or the natural environment; (3) control of development; and (4) enhancement of aesthetic values. Other purposes included: protection of life and property, enhancement of public recreation, soil conservation, and protection of water resources. Development and economic purposes were cited in relatively few laws. The 1972 Coastal Zone Management Act establishes federal policy, authorizes federal assistance to states for developing programs of coastal zone land use control and provides for state approval of federal projects in the coastal zone. (Wilson-Florida)
W80-04495

THE EMERGENCY POWERS IN THE ENVIRONMENTAL PROTECTION STATUTES: A SUGGESTION FOR A UNIFIED EMERGENCY PROVISION,
R. B. Skaff.
The Harvard Environmental Law Review, Vol 3, p 298-325, 1979.

Descriptors: *Pollution abatement, *Environmental control, *Federal Water Pollution Control Act, Protection, Governmental interrelations, Government finance, Administrative agencies, Administrative decisions, Judicial decisions, Remedies.

The emergency powers of the Clean Water Act, the Safe Drinking Water Act, the Clean Air Act, and the 1976 Resource Conservation and Recovery Act are evaluated. A short history of these powers is presented, emphasizing two periods of legislation. The first was characterized by civil remedy provisions. The second by other emergency enforcement options. This is followed by a brief overview of the discretionary powers. Several major themes of the various acts are presented and analyzed: (1) the varying scope of protection; (2) interaction with state and local authorities; (3) the 'imminent and substantial endangerment' standard, including a lengthy discussion of civil actions and the meaning and application of the standard; (4) other remedies; (5) administrative orders; and (6) the funded emergency assistance program. The emergency powers are an effective bargaining tool for obtaining action from state and local governments and individual polluters. It is suggested that the separate provisions be unified under a single provision to reduce the administrative and judicial burden of interpretation and to provide a more efficient legal authority. (Tabano-Florida)
W80-04496

THE FUTURE OF SCIENTIFIC RESEARCH IN CONTIGUOUS RESOURCE ZONES: LEGAL ASPECTS,
J. R. Moore.
International Lawyer (A.B.A.), Vol 8, No 2, p 242-261, April 1974.

Descriptors: *International law, *Research and development, *Oceans, Legal aspects, Treaties, Resources, International waters, United Nations, Conferences, Coasts, Regime.

Scientific research in contiguous resource zones has been a growing practice of nations, to claim jurisdiction over ocean resources within 200 miles of their coasts. Coastal states claim exclusive or preferential resource jurisdiction. The legal status of scientific research in these zones is unsettled. The historical practices of states' scientific research in the oceans are briefly examined. The current state of the law with regard to scientific research in contiguous zones is explored. Four basic problems in defining the legality of research near coastal waters are examined. In assessing the future of scientific research in contiguous zones, the political climate out of which agreements controling such research must come is discussed. The new international law on scientific research should be in the form of a separate and distinct convention on Marine Scientific Research. Considerations, which the convention drafters should consider are outlined. Suggested are a basic structure for the convention and two provisions of the convention, one dealing with notice, and another regarding participation by coastal states. (Daniels-Florida)
W80-04497

AN INTERNATIONAL COMPARISON OF TRENDS IN WATER RESOURCES MANAGEMENT,
Fordham Univ., Bronx, NY. School of Law.
L. A. Teclaff.
Ecology Law Quarterly, Vol 7, No 4, p 881-915, 1979.

Descriptors: *Comparative benefits, *Water resources development, *Preferences(Water rights), Management, Legal aspects, Reclaimed water, Conjunctive use, Economic efficiency, Water supply, Waste water treatment, Use rates.

Efficient water use has become a major goal of modern water management. The various administrative policies used by legal regimes internationally to encourage conservation, recovery, and reuse of water are evaluated. Developing a comprehensive and consolidated administrative system of water law is the current goal of most water codes. Modern water legislation not only subjects all water to a single regulatory structure, but also includes all uses, whether old or new, under that system. In conjunction with the current trend in water resources management, such concepts as pre-existing uses, preference of use, qualified water rights, pricing systems, recycled water, and con-

junctive use are compared. As worldwide demand for water steadily grows, it is increasingly important that the legal rules governing the management and utilization of water resources actively promote, rather than impede, efficiency in water use. This basic policy goal is evaluated and examined. Possible methods of implementation are suggested. (Schwerer-Florida)
W80-04498

FEDERAL COMMON LAW: JUDICIALLY ESTABLISHED EFFLUENT STANDARDS AS A REMEDY IN FEDERAL NUISANCE ACTIONS,
D. Leybold.
Boston College Environmental Affairs Law Review, Vol 7, No 2, p 293-315, 1978.

Descriptors: *Wisconsin, *Illinois, *Water quality standards, *Water pollution control, Sewage disposal, Federal government, Federal jurisdiction, Judicial decisions, State governments, Water pollution, Legal aspects.

The United States Supreme Court, in Illinois v. City of Milwaukee, revitalized the federal common law of nuisance by ruling that certain suits, alleging that water pollution created a public nuisance, could be heard in federal courts on the basis of federal law. The United States District Court for the Northern District of Illinois, which subsequently heard the case on its merits, made its rulings under the federal common law of nuisance. The district court found that Milwaukee's sewage discharge into Lake Michigan created a nuisance, and ordered Milwaukee to comply with specific court-established effluent standards. The Supreme Court's decision formally added nuisance law, as applied to interstate navigable waters, to the list of substantive areas governed by federal common law. The district court's ruling is consistent with federal common law principles; if the court's standards are seen as findings of fact aimed only at limiting the activities which created the nuisance. Such a holding protects Illinois' sovereign right not to be subjected to outside nuisance. (Wilson-Florida)

NONPOINT POLLUTION CONTROL IN VIRGINIA,
J. V. Cogbill, III.
University of Richmond Law Review, Vol 13, No 3, p 539-556, Spring 1979.

Descriptors: *Virginia, *Urban runoff, *Agricultural runoff, *Water pollution control, Pollutants, Legislation, Soil erosion, Waste, Identification, Federal Water Pollution Control Act, Pesticides, Water pollution sources, Water law.

Nonpoint pollution includes soil erosion from agricultural, silvicultural, and mining sources, as well as urban runoff. Soil erosion is the major pollution threat, carrying the pesticides, fungicides, rodenticides, nutrients placed in the soil, and other contaminants used or created by land use. In Virginia, nonpoint pollution is presently uncontrolled and a threat to the marine environment. In 1972 Congress enacted the Federal Water Pollution Control Act. The discharge control mechanism was articulated in section 402 as the National Pollution Discharge System, establishing a permit program to impose effluent limitations. The states were primarily responsible for implementation. The 1977 Clean Water Act (1977 Act) presented a stronger and clearer direction for states to identify and control sources of nonpoint pollution. Section 208 of the 1977 Act provides that each state develop areawide planning to control such pollution sources as agriculture, silviculture, mining and urban runoff. In Virginia, the State Water Control Board began implementation of a state waste management plan. Virginia relies on voluntary participation by agricultural nonpoint source polluters. A more affirmative role by the state is needed. (Wilson-Florida)

Descriptors: *Reservoir operation, *Flood control, *Mathematical models, *Shore protection, Iowa, Vegetation effects, Erosion control, Soil conservation, Flood damage, Reservoir releases, Succession, Trees, Forest management, Vegetation regrowth.

Mathematical models were developed and used to simulate the effect of fluctuating water levels in multipurpose reservoirs in Iowa. The models are designed as management and operational tools to evaluate trade-offs between the environmental impacts in the flood pool upstream of the dam and the economic benefits downstream of the dam. The Saylorville Reservoir located on the Des Moines River was used for the study because it periodically inundates an environmentally sensitive and scenic area in the Ledges State Park, one of the area's most popular recreational parks. A dynamic programming optimization model was developed to select the optimal operating policy for the reservoir. The model is forward looking and has only a single decision variable, the release rate from the reservoir. State incremental or discrete differential solution algorithms are not needed as the number of discrete states used is not excessive. The 10 largest historical floods were input to determine the operating policy which best minimizes damages. Also used were a reservoir routing model and a vegetative succession model. The vegetative model simulated general vegetative responses to flooding but it does not give precise results for specific sites. The lower areas of Ledges State Park will be heavily impacted by high reservoir water levels and extensive cleanup will be needed after each inundation. Five vegetative zones were defined for degree of damage and various techniques for mitigation are recommended. (Seigler-IPA)

7. RESOURCES DATA

7A. Network Design

A PROPOSED GROUND WATER QUALITY MONITORING NETWORK FOR IDAHO,
Geological Survey, Boise, ID. Water Resources Div.
R. L. Whitehead, and D. J. Parliman.
Geological Survey open-file report 79-1477 (WRI), October 1979. 67 p, 10 Fig, 22 Tab, 25 Ref.

Descriptors: *Groundwater, *Water quality, *Monitoring, *Observation wells, *Network design, Idaho, Hydrologic data, Aquifers, River basins, Model studies, Groundwater movement, Groundwater recharge, Base flow, Water pollution sources, Sampling, Sites, Water analysis, Planning, Evaluation, Data collections, Data storage and retrieval, *Watstore.

A ground water quality monitoring network is proposed for Idaho. The network comprises 565 sites, 8 of which will require construction of new wells. Frequencies of sampling at the different sites are assigned at quarterly, semiannual, annual, and 5 years. Selected characteristics of the water will be monitored by both laboratory- and field-analysis methods. The network is designed to: (1) Enable water managers to keep abreast of the general quality of the State's ground water, and (2) serve as a warning system for undesirable changes in ground-water quality. Data were compiled for hydrogeologic conditions, ground-water quality, cultural elements, and pollution sources. A 'hydrologic unit priority index' is used to rank 84 hydrologic units (river basins or segments of river basins) of the State for monitoring according to pollution potential. Emphasis for selection of monitoring sites is placed on the 15 highest ranked units. The potential for pollution is greatest in areas of privately owned agricultural land. Other areas of pollution potential are residential development, mining and related processes, and hazardous waste disposal. Data are given for laboratory and field analyses, number of site visits, manpower, subsistence, and mileage, from which costs for implementing the network can be estimated. Suggestions are made for data storage and retrieval and for reporting changes in water quality. (Kosco-USGS)

AUTOMATIC MEASUREMENT OF SOIL-WATER PRESSURE USING A CAPACITANCE MANOMETER,
Centre National de la Recherche Scientifique, Grenoble (France). Inst. de Mecanique de Grenoble.
J. L. Thony, and G. Vachaud.
Journal of Hydrology, Vol 46, No 1/2, p 189-196, March 1980. 5 Fig, 4 Ref.

Descriptors: *Soil water, *Pore pressure, *Measurement, *Instrumentation, *Capacitors, *Pressure measuring instruments, Manometers, Soil profiles, Infiltration, Calibrations, Electrical equipment, Patents, Capacitance manometers, Pressure transducers.

A new, cheap, and reliable pressure transducer has been developed. It is based on the use of a mercury manometer with the outer face of the glass tubing covered with a transparent metallic oxide. This acts as the fixed outer electrode of a capacitor, of which the capacitance linearly changes with the position of the mercury in the tube. This pressure transducer can be linked with an automatic recording device. Examples were given of the field use of a series of these transducers in which they were coupled to tensiometers in a natural water-balance study. (Visocky-ISWS)

A NEW TECHNIQUE FOR MEASURING TIDAL CURRENTS BY USING A TWO-SITE HF DOPPLER RADAR SYSTEM,
National Oceanic and Atmospheric Administration, Boulder, CO. Wave Propagation Lab.
A. S. Frisch, and B. L. Weber.
Journal of Geophysical Research, Vol 85, No C1, p 485-493, January 20, 1980. 10 Fig, 1 Tab, 13 Ref.

Descriptors: *Currents(Water), *Tidal waters, *Tidal effects, *Radar, *Alaska, Remote sensing, Tides, Circulation, Water circulation, Ocean circulation, Ocean currents, Bays, Coasts, Data processing, Spatial distribution, Analytical techniques, *Cook Inlet(AK), Tidal currents, Doppler radar.

Surface currents were measured by using a newly developed high-frequency (HF) Doppler radar technique. The system was operated in lower Cook Inlet, Alaska, in July 1977. During one particular day, July 13, radar data collected every 30 min for 24 hours was analyzed. By least squares fitting these data to two of the dominant tidal periods, 12.31 and 24.6 hours, the spatial distribution of the tidal currents for each of these two periods was determined. In addition, the spatial distribution of the mean surface currents for this 24-hour period was analyzed. Analysis of this data showed that near Kachemak Bay there is a distinct difference of the east-west component of tidal flow in comparison with regions further from Kachemak. In addition, longer period components were observed for which the period could not be determined. These components exhibited gyrelike spatial patterns. Results demonstrated the use of HF radar techniques for resolving spatial and temporal currents which affect the nearshore environment. (Sims-ISWS)

A SIMPLE TUBULAR PHYTOPLANKTON SAMPLER FOR VERTICAL PROFILING IN LAKES,
Ontario Ministry of the Environment, Ottawa. Water Resources Branch.
K. H. Nicholls.
Freshwater Biology, Vol 9, No 2, p 85-89, April 1979. 2 Fig, 7 Ref.

Descriptors: *Phytoplankton, *Equipment, *Water sampling, Buckskin Lake, Ontario, Tadenac Lake, Sampling, Depth, Materials, Testing procedures, Water analysis, Lakes, Data collections, Biomass, Algae, Epilimnion, Hypolimnion, Canada.

This paper describes a tubular phytoplankton sampler which offers versatility not available in other samplers and which is simply and inexpensively constructed. By pooling samples from a 2 m or 3 m tube, a composite sample of any selected depth interval can be obtained. The sampler consists of a tube with an exterior valve mechanism at the lower end which opens when the sampler is lowered and closes when it is raised. A capping plate at the top opens the tube to lakewater passing through it during descent and closes off the top when the tube travels upward to the lake surface. Opening and closing is activated by water pressure exerted on two exterior vanes, avoiding a messenger-activated closing mechanism. The new sampler collected phytoplankton from Buckskin and Tadenac Lakes, Ontario, August 1977. In each lake, maximum phytoplankton density was not in the epilimnion but in the metalimnion or upper hypolimnion. In both lakes, certain chrysophytes had distinctly higher densities below the epilimnion. (Danovich-Wisconsin)

STAINING PREPARATIONS FOR PHYTOPLANKTON AND PERIPHYTON,
NUS Corp., Pittsburgh, PA. Ecological Sciences Div.
B. B. Owen, Jr., M. Afzal, and W. R. Cody.
British Phycological Journal, Vol 13, No 2, p 155-160, June 1978. 3 Tab, 10 Ref.

Descriptors: *Phytoplankton, *Analytical techniques, *Methodology, *Dyes, *Periphyton, Diatoms, Cytological studies, Algae, Testing procedures, Biomass, Biological communities, Microscopy, Testing, Evaluation, Water analysis, Laboratory tests.

Phytoplankton and periphyton can be studied on the same slides by staining preserved samples with acid fuchsin, dehydrating them and then preparing membrane-filter (phytoplankton) or slurry (periphyton) microscope mounts. The methods provide a single preparation procedure for phytoplankton or periphyton samples, allowing investigators to study diatom and non-diatom components in detail and to distinguish diatoms alive at collection from those already dead, based on visible cell contents. The ability to distinguish between live and dead diatoms provides information more ecologically meaningful than that generated by methods based upon cleaned diatom studies. Procedures described in this result mostly from excessive filtration vacuum rather than from loss of material during preparation. However, no significant differences occur in ratios of live, dead, and broken diatoms after sample preparation by wet mounts, centrifuging or sedimentation. The staining methods presented offer attractive alternatives to conventional methods, especially when the algal communities being studied contain large diatom numbers. (Danovich-Wisconsin)

WATER RESOURCES DATA FOR IDAHO, WATER YEAR 1978--VOLUME 1. GREAT BASIN AND SNAKE RIVER BASIN ABOVE KING HILL.
Geological Survey, Boise, ID. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-155542, Price codes: A16 in paper copy, A01 in microfiche. Geological Survey Water-Data Report ID-78-1, September 1979. 457 p, 12 Fig.

Descriptors: *Idaho, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, Great Basin, *Snake River basin(Idaho).

Water resources data for the 1978 water year for Idaho consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of ground water. This report in two volumes contains discharge records for 192 gaging stations; stage only records for 2 gaging stations; stage for 6 lakes; contents for 24 lakes and reservoirs; water-quality for 103 gaging stations, 48 partial-record stations, and 179 wells; and water levels for 429 observation wells. Also included are data for 57 crest-stage partial-record stations and 191 low-flow partial-record stations. Additional water data were collected at various sites, not involved in the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Idaho. (Kosco-USGS)

Geological Survey, Tallahassee, FL. Water Resources Div.
T. R. Beaven.
Available from: OFSS U.S. Geological Survey Box 25425, Federal Center Denver, CO, paper copy $13.00 microfiche $3.50. Geological Survey open-file report 79-1258, 1979. 93 p, 47 Fig, 10 Tab, 25 Ref.

Descriptors: *Hydrologic data, *Surface waters, *Groundwater, *Water quality, *Florida, Data collections, Rainfall, Runoff, Streamflow, Water analysis, Water wells, Water utilization, Pumping, Withdrawal, Groundwater recharge, Aquifer characteristics, Hydrographs, Water pollution sources, Water management(Applied), Broward County(Fla).

During the 1976 water year, rainfall was 3.6 percent below average in Broward County, Fla. Water levels in the Pompano Beach and Dixie well fields were lower during the peak of the 1976 dry season than the peak of the record low dry season in 1971. Flow in the major canals was variable during the 1976 water year compared to 1962-75 averages. Flows in Cypress Creek, Middle River, and Snake Creek at S-29 were higher than the average. Flows in Plantation Canal and South New River were equal to the 1962-75 averages, while Hillsboro, North New River, and Snake Creek at N.W. 67th Avenue were below the long-term averages. The concentrations of principal mineral constituents in surface water in Broward County were within limits established by Florida State Water Standards, with the exception of iron at one station. Total coliforms were equal to or within permissible limits for class III water and waters for public supply in Broward canals at all sites during the 1976 water year. Fecal coliform did not exceed the permissible limit for public water supply at any of the sites during the 1976 water year. (Kosco-USGS)

DOWN EASTERS HEAD FOR THE BEDROCK.
Ground Water Age, Vol 14, No 5, p 25, 28, January, 1980.

Descriptors: *Maine, *Bedrock, *Water wells, *Drilling, Dug wells, Well regulations, Municipal water, Aquifers, Granites.

Residential water wells in Maine, which are underlain by granite, are either shallow, dug wells in glacial drift or deep, drilled wells in bedrock well below the water table. Municipal wells require more water than most aquifers in Maine are capable of producing. Finding adequate aquifers requires exploratory drilling in valleys. Maine is one of the least regulated states in terms of water wells. (Purdin-NWWA)

PERCUSSION DRILLING TECHNOLOGIES,
National Water Well Association, Worthington, OH.
T. E. Gass.
Water Well Journal, Vol 34, No 1, p 29-31, January, 1980. 3 Fig.

Descriptors: *Drilling, *Technology, Drilling equipment, Cable-tool drilling, Developing countries, *Water wells.

In developing countries a hand-dug well requires more time and capital than a drilled well. However, drilled wells are impractical due to high maintenance and operating costs, difficulty in obtaining spare parts and transporting equipment. A more practical approach would be the development of labor-intensive percussion drilling technology. Tripods can be constructed of bamboo, timber, lumber, or scrap metal pipe depending on availability. Vertical reciprocating motion can be produced by means of a spring pole, a lever, or by alternately pulling and releasing a rope. In some areas, a motorized cathead can be used. The dry bucket percussion drilling method is simple and fast as long as the soil adheres to the inside of the bucket. In the bail-down method, water is added to the borehole and the casing is lowered by bailing soil from beneath the casing. Bailers can be constructed from sections of well casing and scrap metal. This method is suitable for large diameter (10-inch) wells in sandy formations. (Purdin-NWWA)
W80-04435

LARGE DIAMETER SHALLOW WELLS.
Canadian Water Well, Vol 6, No 1, p 21, February, 1980.

Descriptors: *Shallow wells, *Water wells, *Construction, Dug wells, Concrete pipes, Water pollution, Heaving, Drying, Water storage, Domestic water.

Hand-dug wells usually have little standing water due to difficulty in digging below the water table. The bucket boring machine and concrete well tiles have overcome this problem. Other problems of dug or bored wells are their susceptibility to pollution, heaving of fine sand and silt, and drying during droughts. However, when properly constructed, bored wells are extremely effective, especially in areas where the rate of aquifer yield is limited or where fine sand prohibits the use of screened wells. Bored wells provide an adequate storage volume for domestic water use where a conventional drilled well cannot. (Purdin-NWWA)

SUBMERGED RADIAL HYDRAULIC JUMP,
Windsor Univ. (Ontario). Dept. of Civil Engineering.
J. A. McCorquodale, and A. M. Khalifa.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY3, Proceedings Paper 15250, p 355-367, March 1980. 11 Fig, 12 Ref, 2 Append.

Descriptors: *Hydraulic jump, *Energy dissipation, *Outlet works, *Settling basins, Hydraulics, Dams, Energy, Velocity, Pressure, Sluice gates, Froude number, Laboratory tests, Hydraulic design, *Submerged flow, *Radial flow.

A slight flaring of the side walls of the stilling basin can be advantageous in reducing the exit velocities. The hydraulic jump in such a stilling basin is referred to as a radial hydraulic jump. When the sluice gates discharge directly to the stilling basin, a submerged radial hydraulic jump will probably occur. An experimental study produced surface profiles, bed pressure, and length characteristics for the submerged radial jump. A fourth-degree polynomial was used to describe the surface profile. The submerged radial jump lengths were found to be from 50% to 70% of the corresponding submerged rectangular jump lengths. Improved energy dissipation is also characteristic of the radial jumps. The model consisted of a 1.0-m long stilling basin with a total divergence angle of 13.5 degrees located downstream through a sluice gate. A theoretical equation was proposed to describe the relationship among: gate submergence, exit depth, initial depth, initial Froude number, and basin divergence. (Adams-ISWS)

SUMMARY OF HYDROLOGIC DATA FOR TAMPA BYPASS CANAL SYSTEM, JULY 1974 TO SEPTEMBER 1976,
Geological Survey, Tallahassee, FL. Water Re-

sources Div.
K. W. Causseaux, and H. C. Rollins.
Available from: OFSS, USGS Box 25424, Fed. Ctr. Denver, CO, paper copy $10.00 microfiche $3.50. Geological Survey open-file report 79-1297, 1979. 74 p, 10 Fig, 16 Tab, 1 Ref.

Descriptors: *Hydrologic data, *Canals, *Groundwater, *Surface waters, *Data collections, Flood control, Water wells, Networks, Monitoring, Sampling, Sites, Water quality, Trace metals, Nutrients, Chemical analysis, Pesticides, Aquifers, Potentiometric levels, Discharge(Water), Florida, *Tampa Bypass Canal(Fla).

The Tampa Bypass Canal is part of a flood-control project east of the city of Tampa, Fla., under construction by the U.S. Army Corps of Engineers. It will divert floodwater from the Hillsborough River at points upstream from Tampa through a canal system to McKay Bay. The U. S. Geological Survey began a hydrologic data program in 1974 to provide data needed to identify existing hydrologic conditions and to evaluate the effects of canal construction. A network of surface-water and ground-water sites was designed to monitor changes in nutrients, trace metals, inorganic constituents, pesticides, and benthic invertebrates along the canal system; to monitor changes in trace elements, common constituents, nitrates, specific conductance, and chlorides in the Floridan aquifer; and to monitor changes in the potentiometric surface of the Floridan aquifer. In 1974-75, the monitoring program consisted of drilling 12 monitor wells and initiation of the surface-water sampling program. In 1976, the program consisted of drilling 5 additional wells, continuation of the surface-water sampling, initiation of ground-water sampling program, and monitoring of discharge from springs. Water-quality data for 9 surface-water sites in the basin were collected at each of the control structure sites, in the tidal portion of the canal, and at each of the major tributaries to the canal system. ACTIVATED CARBON
Anaerobic-Activated Carbon Filters for the Removal of Refractory and Toxic Organic Compounds in Wastewater,
W80-04205 5D

ADAPTATION
Mechanisms of Rapid Photosynthetic Adaptation in Natural Phytoplankton Communities. I. Redistribution of Excitation Energy Between Photosystems I and II,
W80-04452 5C

ADMINISTRATION
The California Water Atlas.
W80-04444 2A

ADMINISTRATIVE AGENCIES
Water Quality Committee-Annual Review of Significant Legislature, Judicial and Administrative, Activities During 1977.
W80-04472 6E

ADSORPTION
Phosphorus in a Model Pond Study: I Sediment Selection and Preparation,
W80-04343 5C

AGE
Reflectance Spectroscopy of Marine Phytoplankton. Part I. Optical Properties as Related to Age and Growth Rate,
W80-04279 5C

AGRICULTURAL RUNOFF
The Transport and Oxygen Demand of Organic Carbon Released to Runoff from Crop Residues,
W80-04226 5B

Agricultural Sources of Fluvial Suspended Sediments,
W80-04258 2J

Nonpoint Pollution Control in Virginia,
W80-04500 6E

AGRICULTURAL WATERSHEDS
Effect of Agriculture on Cedar Lake Water Quality,
W80-04206 2H

Reclamation Law Constraints on Energy/Industrial Uses of Western Water,
W80-04483 6E

AGRICULTURE
Potential Pollutants from Agriculture--An Assessment of the Problem and Possible Control Approaches,
W80-04228 5B

Data Filtering Techniques and Regional Assessment of Agricultural Impacts upon Water Quality, Southern Ontario,
W80-04255 5B

ALASKA
Model Application to Urban Groundwater Problems of Fairbanks, Alaska,
W80-04295 2F

A New Technique for Measuring Tidal Currents by Using a Two-Site HF Doppler Radar System,
W80-04307 7B

ALGAE
Dynamics of Dissolved Oxygen During Algal Bloom in Lake Kasumigaura, Japan,
W80-04242 2H

Availability to Scenedesmus Quadricauda of Different Forms of Phosphorus in Sedimentary Materials from the Great Lakes,
W80-04253 5C

Ammonium Uptake by Symbiotic and Aposymbiotic Reef Corals,
W80-04340 2I

Outdoor Algal Mass Cultures-II. Photosynthetic Yield Limitations,
W80-04358 5C

An Empirical Study of Factors Affecting Blue-Green Versus Nonblue-Green Algal Dominance in Lakes,
W80-04441 5C

A Computational Model for Growth and Harvesting of the Marine Alga Ascophyllum Nodosum,
W80-04461 5C

ALGAL DOMINANCE
An Empirical Study of Factors Affecting Blue-Green Versus Nonblue-Green Algal Dominance in Lakes,
W80-04441 5C

ALGAL GROWTH POTENTIAL
The Use of Periphyton from Lake Zurich to Extimate the Algal Growth Potential in River Limmat Water,
W80-04446 5C

ALLELOPATHY
Interaction (Allelopathy) Between Marine Diatoms: Thalassiosira Pseudonana and Phaeodactylum Tricornutum,
W80-04281 5C

ALLUVIUM
Hydrogeologic Features of the Alluvial Deposits in the Nowood River Drainage Area, Bighorn Basin, Wyoming,
W80-04382 2F

AMAZON RIVER
Influence of Amazon River Discharge on the Marine Production System Off Barbados, West Indies,
W80-04275 5C

AMMONIA
Distribution, Fluxes and Biological Utilization of Inorganic Nitrogen During a Spring Bloom in the New York Bight,
W80-04274 5C

The Effect of Dissolved Oxygen and Salinity on the Toxicity of Ammonia to Smolts of Salmon, Salmo Salar L.,
W80-04397 5A

The Role of Zooplankton in the Nitrogen Dynamics of a Shallow Estuary,
W80-04448 5C

AMMONIUM COMPOUNDS
Ammonium Uptake by Symbiotic and Aposymbiotic Reef Corals,
W80-04340 2I

ANABAENA
Phosphate Requirement of Anabaena Oscillarioides and Its Ecological Implications,
W80-04454 5C

ANAEROBIC CONDITIONS
Anaerobic-Activated Carbon Filters for the Removal of Refractory and Toxic Organic Compounds in Wastewater,
W80-04205 5D

ANALYTICAL TECHNIQUES
Diurnal Oxygen Rhythm and Primary Production in the Mixed Layer of the Atlantic Ocean at 20 Degrees N,
W80-04282 5A

Current C14 Methods for Measuring Primary Production: Gross Underestimates in Oceanic Waters,
W80-04284 5A

Evaluation of Protocols for Pesticides and PCB's in Raw Wastewater,
W80-04300 5A

Description and Use of an Improved Method for Determining Estuarine Zooplankton Grazing Rates on Phytoplankton,
W80-04357 5A

Staining Preparations for Phytoplankton and Periphyton,
W80-04365 7C

ANIMAL PHYSIOLOGY
Effect of Some Pesticides on the Rhythmic Adductor Muscle Activity of Fresh-Water Mussel Larvae,
W80-04406 5A

Effect of Organophosphate Insecticide 'Owadofos Plynny-50' (Fenitrothion) on Bioelectric Changes in Cardiac Muscle of Eel, Anguilla Anguilla L.,
W80-04416 5C

ANIMAL POPULATIONS
Population Structure and Species Composition of the Free-Living Nematodes Inhabiting Sands of the New York Bight Apex,
W80-04391 5C

ANODONTA
Behavioural Studies on Mussels Under Changing Environmental Conditions,
W80-04404 5A

Effect of Some Pesticides on the Rhythmic Adductor Muscle Activity of Fresh-Water Mussel Larvae,
W80-04406 5A

ANTARCTIC
On the Origin of Stratified Debris in Ice Cores from the Bottom of the Antarctic Ice Sheet,
W80-04325 2C

Depolarization of Radio Waves Can Distinguish Between Floating and Grounded Ice Sheets,
W80-04328 2C

ANTIFREEZE
An Effective Antifreeze for Storage Raingauges,
W80-04243 2B

ANTIMONY
A Comparison of the Acute Toxicities of Ten Heavy Metals to Phytoplankton from Saanich Inlet, B.C., Canada,
W80-04398 5C

AQUATIC ALGAE
Growth Responses of Selected Freshwater Algae to Trace Elements and Scrubber Ash Slurry Generated by Coal-Fired Power Plants,
W80-04386 5C

Sodium and Potassium Ions Effects on Phosphorus Transport in Algal Cells,
W80-04392 5C

AQUATIC WEED CONTROL
Changes in Phosphorus Concentration in a Eutrophic Lake as a Result of Macrophyte-Kill Following Herbicide Application,
W80-04276 5C

Plant Pathogens as Agents for Biological and Integrated Control of Aquatic Plants,
W80-04290 5B

AQUICULTURE
Oxygen-Regime and Artificial Aeration of Net-Cages in Mariculture,
W80-04410 5A

The Sea-Water Well System at the Fisheries Laboratory, Lowestoft and the Methods in Use for Keeping Marine Fish,
W80-04415 5A

AQUIFER CHARACTERISTICS
Groundwater Utilization, South Fork of Long Island,
W80-04302 2F

Results of Transient Simulations of a Digital Model of the Arikaree Aquifer Near Wheatland, Southeastern Wyoming,
W80-04379 4B

Hydrogeologic Features of the Alluvial Deposits in the Nowood River Drainage Area, Bighorn Basin, Wyoming,
W80-04382 2F

AQUIFERS
The Hydrochemistry of an Aquifer Network,
W80-04263 2K

ARCTIC
Methane Addition to an Arctic Lake in Winter,
W80-04308 5B

ARIKAREE AQUIFER (WYO)
Results of Transient Simulations of a Digital Model of the Arikaree Aquifer Near Wheatland, Southeastern Wyoming,
W80-04379 4B

ARSENIC
Growth Responses of Selected Freshwater Algae to Trace Elements and Scrubber Ash Slurry Generated by Coal-Fired Power Plants,
W80-04386 5C

A Comparison of the Acute Toxicities of Ten Heavy Metals to Phytoplankton from Saanich Inlet, B.C., Canada,
W80-04398 5C

ARTIFICIAL AERATION
Oxygen-Regime and Artificial Aeration of Net-Cages in Mariculture,
W80-04410 5A

ASH
Growth Responses of Selected Freshwater Algae to Trace Elements and Scrubber Ash Slurry Generated by Coal-Fired Power Plants,
W80-04386 5C

ASP
Human Impacts on Biomass, Population Size and Yield-Per-Recruits of Asp (Aspius Aspius L.) in Lake Balaton,
W80-04409 5A

ASPIUS
Human Impacts on Biomass, Population Size and Yield-Per-Recruits of Asp (Aspius Aspius L.) in Lake Balaton,
W80-04409 5A

ASYMPTOTIC INFILTRATION RATE
Effective Rainfall Estimation,
W80-04231 2G

ATLANTIC COASTAL PLAIN
Rural Nonpoint Source Water Quality in a Southeastern Watershed,
W80-04221 5B

ATLANTIC OCEAN
Diurnal Oxygen Rhythm and Primary Production in the Mixed Layer of the Atlantic Ocean at 20 Degrees N,
W80-04282 5A

Dissolved and Particulate Organic Carbon in the North Equatorial Current of the Atlantic Ocean,
W80-04283 5C

Current C14 Methods for Measuring Primary Production: Gross Underestimates in Oceanic Waters,
W80-04284 5A

ATLANTIC SALMON
The Effect of Dissolved Oxygen and Salinity on the Toxicity of Ammonia to Smolts of Salmon, Salmo Salar L.,
W80-04397 5A

AUSTRALIA
Agricultural Land Use and Its Effect on Catchment Output of Salt and Water--Evidence from Southern Australia,
W80-04259 2F

The Hydrochemistry of an Aquifer Network,
W80-04263 2K

Effects of Rural and Urban Sources of Phosphorus of Lake Burley Griffin,
W80-04270 5B

BACTERIA
Clostridium Perfringens as a Water Pollution Indicator,
W80-04247 5B

Occurrence of Nitric and Nitrous Oxides in a Coastal Marine Sediment,
W80-04362 2K

Effect of Nutrient Inflow on the Bacterial Flora in the River Sakuragawa, Japan,
W80-04447 5C

BALANUS
Mortality, Growth and Fecundity of Transplanted Mussel and Barnacle Populations Near a Pulp Mill Outfall,
W80-04418 5C

BANK EROSION
Kinetics of Red Clay Bluff Dissolution in Western Lake Superior,
W80-04216 2J

BARBADOS
Influence of Amazon River Discharge on the Marine Production System Off Barbados, West Indies,
W80-04275 5C

BARNACLES
Mortality, Growth and Fecundity of Transplanted Mussel and Barnacle Populations Near a Pulp Mill Outfall,
W80-04418 5C

BASELINE STUDIES
Distribution and Abundance of Attached, Littoral Algae in 21 Lakes and Streams in the Northwest Territories,
W80-04347 5C

Abundance, Population Dynamics and Production of Zoobenthos in Lake Myvatn, Iceland,
W80-04352 5C

The Lake Myvatn Ecosystem, Iceland,
W80-04354 5C

Mercury in Water, Organisms and Sediments from a Section of the Turkish Mediterranean Coast,
W80-04417 5B

Distribution, Abundance, Community Structure, and Trophic Relationships of the Benthic Infauna of the Northeast Gulf of Alaska,
W80-04421 5C

Baseline Studies of Fish and Shellfish Resources of Norton Sound and the Southeastern Chukchi Sea,
W80-04422 5C

Trophic Relationships Among Ice Inhabiting Phocid Seals and Functionally Related Marine Mammals,
W80-04423 5C

Oil Spill Vulnerability, Coastal Morphology, and Sedimentation of the Kodiak Archipelago,
W80-04426 5C

Dynamics of Near Shore Ice,
W80-04427 5C

Coastal Processes and Morphology of the Bering Sea Coast of Alaska,
W80-04430 5C

Oil Spill Trajectory Analysis Lower Cook Inlet, Alaska,
W80-04431 5C

1979 Status of the OTEC Environment Program,
W80-04439 5C

BASIC DATA COLLECTIONS
Descriptive and Comparative Studies of Maine Lakes,
W80-04286 2H

Rainfall-Runoff Data from Small Watersheds in Colorado, October 1974 Through September 1977,
W80-04371 7C

A Compendium of Lake and Reservoir Data Collected by the National Eutrophication

Survey in Eastern North-Central, and Southeastern United States.
W80-04458 5C

BAYS
Mineralogy and Distribution of Fine-Grained Sediments in Little Traverse Bay, Lake Michigan,
W80-04218 2J

BEDROCK
A Sequence of Glacial Deformation, Erosion, and Deposition at the Ice-Rock Interface During the Last Glaciation: Cranbrook, British Columbia, Canada,
W80-04333 2C

Geometry of Former Subglacial Water Channels and Cavities,
W80-04337 2C

Down Easters Head for the Bedrock.
W80-04434 8A

BEDS
Some Basic Concepts of Wave Sediment Transport,
W80-04304 2J

Symposium on Glacier Beds: The Ice-Rock Interface.
W80-04313 2C

Processes of Glacier Erosion on Different Substrata,
W80-04314 2C

A Theoretical Model of Glacial Abrasion,
W80-04315 2C

The Spectral Power Density and Shadowing Function of a Glacial Microrelief at the Decimetre Scale,
W80-04317 2C

Discontinuous Flow, Ice Texture, and Dirt Content in the Basal Layers of the Devon Island Ice Cap,
W80-04327 2C

BENTHIC FAUNA
Abundance, Population Dynamics and Production of Zoobenthos in Lake Myvatn, Iceland,
W80-04352 5C

BENTHOS
The Relation Between Pore Water Chemistry and Benthic Fluxes of Nutrients and Manganese in Narragansett Bay, Rhode Island,
W80-04251 2L

Distribution, Abundance, Community Structure, and Trophic Relationships of the Benthic Infauna of the Northeast Gulf of Alaska,
W80-04421 5C

BHATHWA POKHAR
The Influence of Thick Floating Vegetation (Water Hyacinth: Eichhornia Crassipes) on the Physico-Chemical Environment of a Fresh Water Wetland,
W80-04342 5C

BHC
Pesticide Residues in Lake Balaton,
W80-04402 5B

BIGHORN BASIN (WYO)
Hydrogeologic Features of the Alluvial Deposits in the Nowood River Drainage Area, Bighorn Basin, Wyoming,
W80-04382 2F

BIOACCUMULATION
Bioaccumulation and Bioamplification of Mercury Compounds in a Third Level Consumer, Salmo Gairdneri, Influence of the Temperature Factor (In French),
W80-04396 5B

Pesticide Residues in Lake Balaton,
W80-04402 5B

Correlation Between Cadmium Concentration in the Water and Tissue Residue Levels in Dab, Limanda Limanda L., and Plaice, Pleuronectes Platessa L.,
W80-04407 5A

Seasonal and Environmental Variation in Mn, Fe, Cu and Zn Content of Spartina Alterniflora,
W80-04411 5A

Copper-The Major Metal Component of Glycerid Polychaete Jaws,
W80-04413 5B

Mercury in Water, Organisms and Sediments from a Section of the Turkish Mediterranean Coast,
W80-04417 5B

Chlorinated Hydrocarbons in Fish-Eating Birds from the Gdansk Bay, Baltic Sea,
W80-04419 5B

BIOAMPLIFICATION
Bioaccumulation and Bioamplification of Mercury Compounds in a Third Level Consumer, Salmo Gairdneri, Influence of the Temperature Factor (In French),
W80-04396 5B

BIOASSAY
The Use of Periphyton from Lake Zurich to Extimate the Algal Growth Potential in River Limmat Water,
W80-04446 5C

BIOCHEMICAL OXYGEN DEMAND
Factors Causing Elevated Biological Oxygen Demand in the Littoral Zone of Lake Wingra, Wisconsin,
W80-04457 5C

BIODEGRADATION
Treatability of Carcinogenic and Other Hazardous Organic Compounds,
W80-04298 5D

BIOINDICATOR
Behavioural Studies on Mussels Under Changing Environmental Conditions,
W80-04404 5A

BIOINDICATORS
Clostridium Perfringens as a Water Pollution Indicator,
W80-04247 5B

Diversity and Indicator Species as Measures of Water Pollution in a Subarctic Lake,
W80-04346 5C

BIOLOGICAL COMMUNITIES
The River Continuum Concept,
W80-04222 2E

Biological Observations on the Crater Lakes of Jebel Marra, Sudan,
W80-04350 2H

The Process of Fish Fauna Restoration in the River Pek Following the Catastrophic Outbreak of Gangue from the Copper Mines 'Majdanpek' in Yugoslavia,
W80-04400 5C

BIOLOGICAL PROPERTIES
Descriptive and Comparative Studies of Maine Lakes,
W80-04286 2H

A Time- and Depth-Dependent Model for Physical, Chemical and Biological Cycles in Temperate Lakes,
W80-04460 5C

BIORHYTHMS
Diel Patterns of Phytoplankton Productivity and Extracellular Release in Ultra-Oligotrophic Lake Tahoe,
W80-04399 5C

BIRDS
The Effects of Low Levels of Oil on Aquatic Birds. A Non-Technical Summary of Research Activities FY76 Through FY78,
W80-04432 5C

BIVARIATE-DISCRIMINANT PLOTS
An Empirical Study of Factors Affecting Blue-Green Versus Nonblue-Green Algal Dominance in Lakes,
W80-04441 5C

BLOOD CHEMISTRY
Response of the Tench (Tinca Tinca L.) to Potassium Nitrate Enriched Water,
W80-04387 5B

BLUE GLACIER (WA)
Direct Measurement of Basal Water Pressures: Progress and Problems,
W80-04335 2C

BLUE-GREEN ALGAE
An Empirical Study of Factors Affecting Blue-Green Versus Nonblue-Green Algal Dominance in Lakes,
W80-04441 5C

BLUEGILL
Integration of Biological with Thermal Criteria for Power Plant Design and Water Resource Use,
W80-04289 5C

BOREHOLES
Direct Measurement of Basal Water Pressures: Progress and Problems,
W80-04335 2C

BOTTOM SAMPLING
Studies on the Usefulness of Different Mesh-Size Plankton Nets for Thickening Zooplankton,
W80-04445 5C

BOTTOM SEDIMENTS
The Relation Between Pore Water Chemistry and Benthic Fluxes of Nutrients and Manganese in Narragansett Bay, Rhode Island,
W80-04251 2L

BOUNDARY PROCESSES
Some Basic Concepts of Wave Sediment Transport,
W80-04304 2J

Processes of Glacier Erosion on Different Substrata,
W80-04314 2C

A Theoretical Model of Glacial Abrasion,
W80-04315 2C

Local Friction Laws for Glaciers: A Critical Review and New Openings,
W80-04318 2C

The Unsolved General Glacier Sliding Problem,
W80-04319 2C

The Flow of Ice, Treated as a Newtonian Viscous Liquid, Around a Cylindrical Obstacle Near the Bed of a Glacier,
W80-04320 2C

A Mathematical Approach to the Theory of Glacier Sliding,
W80-04321 2C

Empirical Studies of Ice Sliding,
W80-04323 2C

BREAM
Pesticide Residues in Lake Balaton,
W80-04402 5B

BRITISH COLUMBIA
A Sequence of Glacial Deformation, Erosion, and Deposition at the Ice-Rock Interface During the Last Glaciation: Cranbrook, British Columbia, Canada,
W80-04333 2C

BROWN TROUT
Interactions Between Vascular Actions of Detergent and Catecholamines in Perfused Gills of European Eel, Anguilla Anguilla L. and Brown Trout, Salmo Trutta, L.,
W80-04388 5A

BUFFERING
Buffering of Silica and Phosphate in a Turbid River,
W80-04252 5B

CADMIUM
Effects of Trace Metals on Growth of Yellow Perch (Perca Flavescens) as Measured by RNA-DNA Ratios,
W80-04390 5C

The Effects of Interacting Salinity, Cadmium, and Mercury on Population Growth of an Archiannelid, Dinophilus Gyrociliatus,
W80-04403 5A

Correlation Between Cadmium Concentration in the Water and Tissue Residue Levels in Dab, Limanda Limanda L., and Plaice, Pleuronectes Platessa L.,
W80-04407 5A

CALCITE
Subglacial Regelation Water Film,
W80-04336 2C

CALIFORNIA
Water Resources of the Santa Rosa Indian Reservation and Vicinity, Riverside County, California,
W80-04376 4B

The Potential for Developing Ground-Water Supplies in the Pescadero Area, San Mateo County, California,
W80-04384 6D

The California Water Atlas.
W80-04444 2A

CANADA
Calculation of the Total Anthropogenic Lead in the Sediments of a Rural Ontario Lake,
W80-04210 5B

Groundwater Transport of a Salt Tracer Through a Sandy Lakebed,
W80-04250 2A

Agricultural Sources of Fluvial Suspended Sediments,
W80-04258 2J

A Sequence of Glacial Deformation, Erosion, and Deposition at the Ice-Rock Interface During the Last Glaciation: Cranbrook, British Columbia, Canada,
W80-04333 2C

Jurisdictional and Administrative Limitations Affecting Management of the Halibut Fishery,
W80-04475 6E

Trans-Boundary Pollution Injuries: Jurisdictional Considerations in Private Litigation Between Canada and the United States,
W80-04481 6E

CANALS
Summary of Hydrologic Data for Tampa Bypass Canal System, July 1974 to September 1976,
W80-04373 8B

CAPACITORS
Automatic Measurement of Soil-Water Pressure Using a Capacitance Manometer,
W80-04305 7B

CARBON
The Transport and Oxygen Demand of Organic Carbon Released to Runoff from Crop Residues,
W80-04226 5B

CARBON CYCLE
A Study of the Role of the Seagrass Posidonia Australis in the Carbon Budget of an Estuary,
W80-04278 5C

Dissolved and Particulate Organic Carbon in the North Equatorial Current of the Atlantic Ocean,
W80-04283 5C

CARBON FILTERS
Anaerobic-Activated Carbon Filters for the Removal of Refractory and Toxic Organic Compounds in Wastewater,
W80-04205 5D

Treatability of Carcinogenic and Other Hazardous Organic Compounds,
W80-04298 5D

CARBONATES
Subglacial Regelation Water Film,
W80-04336 2C

CARBONDALE (IL)
Effect of Agriculture on Cedar Lake Water Quality,
W80-04206 2H

CARDIOVASCULAR SYSTEM
Effect of Organophosphate Insecticide 'Owadofos Plynny-50' (Fenitrothion) on Bioelectric Changes in Cardiac Muscle of Eel, Anguilla Anguilla L.,
W80-04416 5C

CARP
Effects of Salinity on Vegetation Consumption and Growth in Grass Carp,
W80-04395 5A

CATECHOLAMINES
Interactions Between Vascular Actions of Detergent and Catecholamines in Perfused Gills of European Eel, Anguilla Anguilla L. and Brown Trout, Salmo Trutta, L.,
W80-04388 5A

CEDAR LAKE (IL)
Effect of Agriculture on Cedar Lake Water Quality,
W80-04206 2H

CENTRAL VALLEY PROJECT
The California Water Atlas.
W80-04444 2A

CHEMICAL OXYGEN DEMAND
The Transport and Oxygen Demand of Organic Carbon Released to Runoff from Crop Residues,
W80-04226 5B

CHEMICAL PRECIPITATION
Improvement of the Quality of Waste Pond Effluents in Northern Areas by Chemical Pre-Precipitation,
W80-04287 5D

Subglacial Regelation Water Film,
W80-04336 2C

CHEMICAL PROPERTIES
Descriptive and Comparative Studies of Maine Lakes,
W80-04286 2H

CHEMISTRY OF PRECIPITATION
Acid Precipitation in the Western United States,
W80-04213 2K

CHIRONOMIDAE
Subfossil Chironomids as Evidence of Eutrophication in Ekoln Bay, Central Sweden,
W80-04453 5C

CHLORINATED HYDROCARBON PESTICIDES
Chlorinated Hydrocarbons in Fish-Eating Birds from the Gdansk Bay, Baltic Sea,
W80-04419 5B

CHLORINATION
Effects of Continuous Chlorination on Entrained Estuarine Plankton,
W80-04220 2L

Effects of Chlorobrominated and Chlorinated Cooling Waters on Estuarine Organisms,
W80-04393 5C

CHLOROPHYLL
A Simple Reflectance Method for the Measurement of Particulate Pigment in Lake Water and Its Application to Phosphorus-Chlorophyll-Seston Relationships,
W80-04224 2H

CHLOROPHYTA
Steady-State Growth and Chemical Composition of the Marine Chlorophyte Dunaliella Tertiolecta in Nitrogen-Limited Continuous Cultures,
W80-04456 5C

CLASSIFICATION
Classification of Wetlands and Deepwater Habitats of the United States,
W80-04301 6B

CLIMATOLOGY
Study of Normal Rainfall of Satara District,
W80-04238 2B

Role of Tree-Ring Analysis and Related Studies in Palaeo-Climatology: Preliminary Survey and Scope for Indian Region,
W80-04241 2B

CLOUD SEEDING
Studies of Silver Iodide Ice-Forming Activity: Verification of Theory,
W80-04244 2B

COAL POWERPLANTS
Growth Responses of Selected Freshwater Algae to Trace Elements and Scrubber Ash Slurry Generated by Coal-Fired Power Plants,
W80-04386 5C

COASTS
Ultraviolet Radiation and Phytoplankton Photosynthesis,
W80-04462 5C

A Regulated Citizen's Bill of Rights,
W80-04466 6E

Coastal Zone Management and Excluded Federal Lands: The Viability of Continued Federalism in the Management of Federal Coastlands,
W80-04482 6E

Model Coastal Zone Statute,
W80-04492 6E

Social Equity in Coastal Zone Planning,
W80-04493 6E

Coastal States Organization: The Past and Future,
W80-04494 6E

Environmental Protection Motivation in Coastal Zone Land-Use Legislation,
W80-04495 6E

COBALT
Ion Exchange Recovery of Cobalt and Copper from Blackbird Mine Drainage,
W80-04296 5D

COLOR
Reflectance Spectroscopy of Marine Phytoplankton. Part 2. A Simple Model of Ocean Color,
W80-04280 5C

COLORADO
Acid Precipitation in the Western United States,
W80-04213 2K

Rainfall-Runoff Data from Small Watersheds in Colorado, October 1974 Through September 1977,
W80-04371 7C

COLORADO RIVER
Leaf Litter Processing in a Regulated Rocky Mountain Stream,
W80-04223 2E

Buffering of Silica and Phosphate in a Turbid River,
W80-04252 5B

The California Water Atlas.
W80-04444 2A

COMBINED SEWERS
Verification of the Water Quality Impacts of Combined Sewer Overflow,
W80-04299 5B

COMMERCIAL FISHING
Human Impacts on Biomass, Population Size and Yield-Per-Recruits of Asp (Aspius Aspius L.) in Lake Balaton,
W80-04409 5A

COMPARATIVE BENEFITS
An International Comparison of Trends in Water Resources Management,
W80-04498 6E

COMPETITION
Interaction (Allelopathy) Between Marine Diatoms: Thalassiosira Pseudonana and Phaeodactylum Tricornutum,
W80-04281 5C

CONFERENCES
Symposium on Glacier Beds: The Ice-Rock Interface.
W80-04313 2C

CONJUNCTIVE USE
Conjunctive Water Use,
W80-04429 4B

CONNECTICUT
Demoralized Wetlands Owners: Is There Just Compensation After Brecciaroli V. Connecticut Commissioner of Environmental Protection.,
W80-04488 6E

CONSERVATION
The California Water Atlas.
W80-04444 2A

CONSTRUCTION
Subglacial Constructions and Investigations at Bondhusbreen, Norway,
W80-04339 2C

Large Diameter Shallow Wells.
W80-04473 8A

COOK INLET (AK)
A New Technique for Measuring Tidal Currents by Using a Two-Site HF Doppler Radar System,
W80-04307 7B

COOLING WATER
Design Criteria for Cooling-Water Outlet Structures,
W80-04310 5B

COOLING WATERS
Effects of Chlorobrominated and Chlorinated Cooling Waters on Estuarine Organisms,
W80-04393 5C

COPPER
Copper-The Major Metal Component of Glycerid Polychaete Jaws,
W80-04413 5B

CORES
On the Origin of Stratified Debris in Ice Cores from the Bottom of the Antarctic Ice Sheet,
W80-04325 2C

Occurrence of Nitric and Nitrous Oxides in a Coastal Marine Sediment,
W80-04362 2K

Subfossil Chironomids as Evidence of Eutrophication in Ekoln Bay, Central Sweden,
W80-04453 5C

COST COMPARISON
Ground Water Heat Pumps - A Cost Comparison,
W80-04424 6B

COSTS
Improvement of the Quality of Waste Pond Effluents in Northern Areas by Chemical Pre-Precipitation,
W80-04287 5D

CRABS
The Influence of Salinity on Behaviour and Oxygen Uptake of the Hermit Crab Pagurus Bernhardus L.,
W80-04412 5C

CRATERS
Biological Observations on the Crater Lakes of Jebel Marra, Sudan,
W80-04350 2H

CULTURES
Interaction (Allelopathy) Between Marine Diatoms: Thalassiosira Pseudonana and Phaeodactylum Tricornutum,
W80-04281 5C

Outdoor Algal Mass Cultures-II. Photosynthetic Yield Limitations,
W80-04358 5C

Steady-State Growth and Chemical Composition of the Marine Chlorophyte Dunaliella Tertiolecta in Nitrogen-Limited Continuous Cultures,
W80-04456 5C

CURRENTS (WATER)
A New Technique for Measuring Tidal Currents by Using a Two-Site HF Doppler Radar System,
W80-04307 7B

CURVES
An Analytical Integration Method of Computing Diurnal Primary Production from Steele's Light Response Curve,
W80-04464 5C

CUTTING MANAGEMENT
A Computational Model for Growth and Harvesting of the Marine Alga Ascophyllum Nodosum,
W80-04461 5C

CYANOPHYTA
Notes on the Growth and Sporulation of a Natural Population of Aphanizomenon Flos-Aquae,
W80-04353 5C

An Empirical Study of Factors Affecting Blue-Green Versus Nonblue-Green Algal Dominance in Lakes,
W80-04441 5C

CYCLING NUTRIENTS
Distribution, Fluxes and Biological Utilization of Inorganic Nitrogen During a Spring Bloom in the New York Bight,
W80-04274 5C

Dissolved and Particulate Organic Carbon in the North Equatorial Current of the Atlantic Ocean,
W80-04283 5C

Role of Sedimentation in the Phosphorus Budget of Natural and Artificial Iowa Lakes,
W80-04294 2H

The Flax Pond Ecosystem Study: Exchanges of Inorganic Nitrogen Between an Estuarine Marsh and Long Island Sound,
W80-04389 2L

The Role of Zooplankton in the Nitrogen Dynamics of a Shallow Estuary,
W80-04448 5C

DAB
Correlation Between Cadmium Concentration in the Water and Tissue Residue Levels in Dab, Limanda Limanda L., and Plaice, Pleuronectes Platessa L.,
W80-04407 5A

DADE COUNTY (FLA)
Stormwater-Runoff Data for a Multifamily Residential Area, Dade County, Florida,
W80-04375 7C

DAIRY INDUSTRY
Studies on the Chemical and Microbiological Characteristics of Soil-Filtered Dairy-Shed Effluent,
W80-04229 5B

Spray Irrigation of Dairy Factory Wastewater Onto Pasture--A Case Study,
W80-04271 5B

Quality of Drainage Water from Pasture Treated with Dairy Shed Effluent,
W80-04272 5B

DAMS
Karstic Spring Recession Hydrograph and Water Temperature Analysis: Oymapinar Dam Project, Turkey,
W80-04234 2F

DARCYS LAW
Application of Recent Results in Functional Analysis to the Problem of Water Tables,
W80-04214 2F

DATA COLLECTIONS
Hydrologic Data for the Morris Bridge Well-Field Area, Hillsborough County, Florida, 1971-78,
W80-04372 2F

Summary of Hydrologic Data for Tampa Bypass Canal System, July 1974 to September 1976,
W80-04373 8B

DECISION MAKING
Social Equity in Coastal Zone Planning,
W80-04493 6E

DECOMPOSING ORGANIC MATTER
The Rates of Dry Matter and Nutrient Loss from Decomposing Potamogeton Pectinatus in a Brackish South-Temperate Coastal Lake,
W80-04355 5C

DEEP-WATER HABITATS
Classification of Wetlands and Deepwater Habitats of the United States.
W80-04301 6B

DENDROCHRONOLOGY
Role of Tree-Ring Analysis and Related Studies in Palaeo-Climatology: Preliminary Survey and Scope for Indian Region,
W80-04241 2B

DENITRIFICATION
Denitrification by the Sessile Microbial Community of a Polluted River,
W80-04345 5C

Occurrence of Nitric and Nitrous Oxides in a Coastal Marine Sediment,
W80-04362 2K

DESIGN STORM
The Weather Report Predicts Rain--An Estimation of Where, When, and How Much Rain Will Fall Can Now Be Determined by Frequency Analysis,
W80-04211 2B

DETERGENTS
The Acute Toxicity of Eleven Detergents to Fish: Results of an Interlaboratory Exercise,
W80-04341 5C

DEVON ISLAND
Discontinuous Flow, Ice Texture, and Dirt Content in the Basal Layers of the Devon Island Ice Cap,
W80-04327 2C

DIATOMS
Interaction (Allelopathy) Between Marine Diatoms: Thalassiosira Pseudonana and Phaeodactylum Tricornutum,
W80-04281 5C

Toxicity of Heavy Metals to the Marine Diatom Ditylum Brightwellii (West) Grunow: Correlation Between Toxicity and Metal Speciation,
W80-04414 5A

Diatom Associations and Succession in Lake Kariba, South Central Africa,
W80-04455 5C

DIEL MIGRATION
Diel Patterns of Phytoplankton Productivity and Extracellular Release in Ultra-Oligotrophic Lake Tahoe,
W80-04399 5C

DINOFLAGELLATES
An Investigation of Heterotrophic and Photoheterotrophic Capabilities in Marine Pyrrhophyta,
W80-04285 5C

DINOPHILUS
The Effects of Interacting Salinity, Cadmium, and Mercury on Population Growth of an Archiannelid, Dinophilus Gyrociliatus,
W80-04403 5A

DIQUAT
Changes in Phosphorus Concentration in a Eutrophic Lake as a Result of Macrophyte-Kill Following Herbicide Application,
W80-04276 5C

DISCHARGE (WATER)
Quantitative Determination of the Subglacial Hydrology of Two Alpine Glaciers,
W80-04338 2C

DISPERSION
Dispersivity and Velocity Relationship From Laboratory and Field Experiments,
W80-04235 2F

Design Criteria for Cooling-Water Outlet Structures,
W80-04310 5B

DISPERSIVITY
Dispersivity and Velocity Relationship From Laboratory and Field Experiments,
W80-04235 2F

DISSOLVED OXYGEN
Nutrient and Oxygen Redistribution During a Spring Neap Tidal Cycle in a Temperature Estuary,
W80-04212 2L

Oxygen Depletion in Lake Erie: Has There Been Any Change,
W80-04225 2H

Dynamics of Dissolved Oxygen During Algal Bloom in Lake Kasumigaura, Japan,
W80-04242 2H

Diurnal Oxygen Rhythm and Primary Production in the Mixed Layer of the Atlantic Ocean at 20 Degrees N,
W80-04282 5A

Dissolved Oxygen Impact from Urban Storm Runoff,
W80-04297 5B

Verification of the Water Quality Impacts of Combined Sewer Overflow,
W80-04299 5B

Development and Survival of Embryos of Lake Herring at Different Constant Oxygen Concentrations and Temperatures,
W80-04394 5C

The Effect of Dissolved Oxygen and Salinity on the Toxicity of Ammonia to Smolts of Salmon, Salmo Salar L.,
W80-04397 5A

Oxygen-Regime and Artificial Aeration of Net-Cages in Mariculture,
W80-04410 5A

DISTRIBUTION PATTERNS
Mineralogy and Distribution of Fine-Grained Sediments in Little Traverse Bay, Lake Michigan,
W80-04218 2J

Study of Normal Rainfall of Satara District,
W80-04238 2B

DNA
Effects of Trace Metals on Growth of Yellow Perch (Perca Flavescens) as Measured by RNA-DNA Ratios,
W80-04390 5C

DRAINAGE
Subglacial Constructions and Investigations at Bondhusbreen, Norway,
W80-04339 2C

DREDGING
Water Management, Water Quality and Engineering Geology Study of Selected Oxbow Lakes as They May Be Impacted by Dredging -- Phase II,
W80-04203 2H

DRILLING
Down Easters Head for the Bedrock.
W80-04434 8A

Percussion Drilling Technologies,
W80-04435 8A

DROUGHTS
Spells of Dry Days Related to Agricultural Drought in India,
W80-04237 2B

DYES
Staining Preparations for Phytoplankton and Periphyton,
W80-04365 7C

ECOLOGY
The Rates of Dry Matter and Nutrient Loss from Decomposing Potamogeton Pectinatus in a Brackish South-Temperate Coastal Lake,
W80-04355 5C

ECONOMIC IMPACT
A Recipe for Bad Water: Welfare Economics and Nuisance Law Mixed Well,
W80-04469 6E

ECONOMIC JUSTIFICATION
A Recipe for Bad Water: Welfare Economics and Nuisance Law Mixed Well,
W80-04469 6E

ECONOMICS
The California Water Atlas.

W80-04496 6E

ENVIRONMENTAL EFFECTS
Baseline Studies of Fish and Shellfish Resources of Norton Sound and the Southeastern Chukchi Sea,
W80-04422 5C

Trophic Relationships Among Ice Inhabiting Phocid Seals and Functionally Related Marine Mammals,
W80-04423 5C

Environmental Assessment of an Active Oil Field in the Northwestern Gulf of Mexico 1977-1978. Volume I - Synopsis.
W80-04433 5C

Environmental Concerns for OTEC Identified in the DOE OTEC Environmental Readiness Document,
W80-04438 5C

Coastal Frontal Systems as a Pollutant Control Mechanism for Offshore Energy Production,
W80-04440 5C

Algal Response to a Thermal Effluent: Study of a Power Station on the Provo River, Utah, USA,
W80-04449 5C

ENVIRONMENTAL GRADIENT
Dynamics and Succession of the Phytoplankton in a Tropical Lake: Lake Lanao, Phillipines,
W80-04363 5C

EQUATIONS
Assessment of the Quality of Generalized Wind Functions in Penman's Equations,
W80-04230 2D

EQUILIBRIUM
Applicability of Cellular Equilibrium and Monod Theory to Phytoplankton Growth Kinetics,
W80-04465 5C

EQUIPMENT
A Simple Tubular Phytoplankton Sampler for Vertical Profiling in Lakes,
W80-04344 7B

Oxygen-Regime and Artificial Aeration of Net-Cages in Mariculture,
W80-04410 5A

EROSION
Kinetics of Red Clay Bluff Dissolution in Western Lake Superior,
W80-04216 2J

Agricultural Sources of Fluvial Suspended Sediments,
W80-04258 2J

Processes of Glacier Erosion on Different Substrata,
W80-04314 2C

Giant Grooves Made by Concentrated Basal Ice Streams,
W80-04334 2C

Geometry of Former Subglacial Water Channels and Cavities,
W80-04337 2C

Application of Geomorphic Principles to Environmental Management in Semiarid Regions,
W80-04443 4D

The Irrigation Revolution and Its Environmental Consequences,
W80-04490 6E

EROSION CONTROL
Application of Geomorphic Principles to Environmental Management in Semiarid Regions,
W80-04443 4D

ESTIMATING
Estimates of Lake St. Clair Evaporation,
W80-04217 2D

Estimation of Soil Moisture at Deeper Depth from Surface Layer Data,
W80-04236 2G

Diurnal Oxygen Rhythm and Primary Production in the Mixed Layer of the Atlantic Ocean at 20 Degrees N,
W80-04282 5A

Current C14 Methods for Measuring Primary Production: Gross Underestimates in Oceanic Waters,
W80-04284 5A

Evaluation of Methods for Estimating Ground-Water Withdrawals in Western Kansas,
W80-04370 4B

ESTIMATING EQUATIONS
Description and Use of an Improved Method for Determining Estuarine Zooplankton Grazing Rates on Phytoplankton,
W80-04357 5A

ESTUARIES
Nutrient and Oxygen Redistribution During a Spring Neap Tidal Cycle in a Temperature Estuary,
W80-04212 2L

Effects of Continuous Chlorination on Entrained Estuarine Plankton,
W80-04220 2L

Demersal Fish and Shellfish Assessment in Selected Estuary Systems of Kodiak Island,
W80-04425 5C

The Role of Zooplankton in the Nitrogen Dynamics of a Shallow Estuary,
W80-04448 5C

ESTUARINE ENVIRONMENT
Effects of Chlorobrominated and Chlorinated Cooling Waters on Estuarine Organisms,
W80-04393 5C

ESTUARINE ENVIRONMENTS
A Study of the Role of the Seagrass Posidonia Australis in the Carbon Budget of an Estuary,
W80-04278 5C

The Flax Pond Ecosystem Study: Exchanges of Inorganic Nitrogen Between an Estuarine Marsh and Long Island Sound,
W80-04389 2L

EUTROPHICATION
Changes in Phosphorus Concentration in a Eutrophic Lake as a Result of Macrophyte-Kill Following Herbicide Application,
W80-04276 5C

A Statistical Model for Small Lake Water Quality Management,
W80-04359 5C

Nitrogen Fixation in a Nitrogen-Limited Impoundment,
W80-04360 5C

Sodium and Potassium Ions Effects on Phosphorus Transport in Algal Cells,
W80-04392 5C

Massive Fish Mortalities Caused by Algal Blooms in Eutrophic Ecosystems,
W80-04408 5C

Studies on the Usefulness of Different Mesh-Size Plankton Nets for Thickening Zooplankton,
W80-04445 5C

Effect of Nutrient Inflow on the Bacterial Flora in the River Sakuragawa, Japan,
W80-04447 5C

Factors Causing Elevated Biological Oxygen Demand in the Littoral Zone of Lake Wingra, Wisconsin,
W80-04457 5C

EVAPORATION
Estimates of Lake St. Clair Evaporation,
W80-04217 2D

Evaporation from Vegetation in Landscapes Developing Secondary Salinity Using the Ventilated-Chamber Technique, II. Evaporation from Atriplex Plantations over a Shallow Saline Water Table,
W80-04273 2D

EVAPOTRANSPIRATION
A Study on Water Availability to the Crops Grown Under Rainfed Conditions in Different Soils at Bijapur,
W80-04239 2G

Suitability of Region-Wide Irrigation Scheduling by Local Evapotranspiration Measurement,
W80-04442 2D

FALLOUT
Fallout Plutonium in an Alkaline, Saline Lake,
W80-04306 2H

FARM MANAGEMENT
The Transport and Oxygen Demand of Organic Carbon Released to Runoff from Crop Residues,
W80-04226 5B

Potential Pollutants from Agriculture--An Assessment of the Problem and Possible Control Approaches,
W80-04228 5B

FECUNDITY
Fecundity and Body Size of Planktic Rotifers in 30 Polish Lakes of Various Trophic State,
W80-04451 5C

FEDERAL LEGISLATION
The Evolution of Water Quality Management, Part 3,
W80-04303 6E

FEDERAL PROJECT POLICY
NOAA's Marine Sanctuary Program,

GORNERA GLACIER (SWITZERLAND)
Sediment Concentration in Melt Waters as an Indicator of Erosion Processes Beneath an Alpine Glacier,
W80-04330 2C

GRAZING
Description and Use of an Improved Method for Determining Estuarine Zooplankton Grazing Rates on Phytoplankton,
W80-04357 5A

GREAT BRITAIN
The Chemistry of the River Wye,
W80-04248 5B

GREAT LAKES
Availability to Scenedesmus Quadricauda of Different Forms of Phosphorus in Sedimentary Materials from the Great Lakes,
W80-04253 5C

Data Filtering Techniques and Regional Assessment of Agricultural Impacts upon Water Quality, Southern Ontario,
W80-04255 5B

GREAT SLAVE LAKE (CANADA)
Diversity and Indicator Species as Measures of Water Pollution in a Subarctic Lake,
W80-04346 5C

GREENLAND
The Debris-Laden Ice at the Bottom of the Greenland Ice Sheet,
W80-04326 2C

GROUND WATER
Ground Water Heat Pumps - A Cost Comparison,
W80-04424 6B

Ground Water Management in Georgia,
W80-04463 4B

GROUNDWATER
Agricultural Land Use and Its Effect on Catchment Output of Salt and Water--Evidence from Southern Australia,
W80-04259 2F

The Effects of Land Use and Hydrology on Groundwater Quality in Mid-Canterbury, New Zealand,
W80-04261 5A

The Effects of Irrigation with Meatworks-Fellmongery Effluent on Water Quality in the Unsaturated Zone and Shallow Aquifer,
W80-04262 3C

The Hydrochemistry of an Aquifer Network,
W80-04263 2K

Nitrate and Chloride in Groundwater, Surface Water and Deep Soil Profiles of Central Canterbury, New Zealand,
W80-04264 5A

Water Resources Data for Idaho, Water Year 1978--Volume 1. Great Basin and Snake River Basin Above King Hill.
W80-04366 7C

Water Resources Data for Idaho, Water Year 1978--Volume 2. Upper Columbia River Basin and Snake River Basin Below King Hill.
W80-04367 7C

Hydrologic Data for the Morris Bridge Well-Field Area, Hillsborough County, Florida, 1971-78,
W80-04372 2F

GROUNDWATER

Summary of Hydrologic Data for Tampa Bypass Canal System, July 1974 to September 1976,
W80-04373 8B

A Proposed Ground Water Quality Monitoring Network for Idaho,
W80-04374 7A

Hydrologic Conditions in Broward County, Florida, 1976,
W80-04378 7C

January 1979 Water Levels, and Data Related to Water-Level Changes, Western and South-Central Kansas,
W80-04380 2F

Ground-Water Quality in the Upper Santa Ana River Basin, Southern California,
W80-04383 5B

The Potential for Developing Ground-Water Supplies in the Pescadero Area, San Mateo County, California,
W80-04384 6D

GROUNDWATER AVAILABILITY

The Potential for Developing Ground-Water Supplies in the Pescadero Area, San Mateo County, California,
W80-04384 6D

GROUNDWATER MINING

Evaluation of Methods for Estimating Ground-Water Withdrawals in Western Kansas,
W80-04370 4B

GROUNDWATER MOVEMENT

Groundwater Transport of a Salt Tracer Through a Sandy Lakebed,
W80-04250 2A

GROUNDWATER RECHARGE

Organic Contaminant Behavior During Groundwater Recharge,
W80-04219 5A

Poliovirus Movement During High Rate Land Filtration of Sewage Water,
W80-04245 5B

Estimation of Recharge to the Phreatic Aquifers of the Lower Maner Basin, India, by Using the Tritium Injection Method,
W80-04249 2F

Model Application to Urban Groundwater Problems of Fairbanks, Alaska,
W80-04295 2F

The Irrigation Revolution and Its Environmental Consequences,
W80-04490 6E

GROUNDWATER RESOURCES

Groundwater Utilization, South Fork of Long Island,
W80-04302 2F

Water Resources of the Santa Rosa Indian Reservation and Vicinity, Riverside County, California,
W80-04376 4B

Hydrogeologic Features of the Alluvial Deposits in the Nowood River Drainage Area, Bighorn Basin, Wyoming,
W80-04382 2F

GROWTH RATES

Reflectance Spectroscopy of Marine Phytoplankton. Part I. Optical Properties as Related to Age and Growth Rate,
W80-04279 5C

An Investigation of Heterotrophic and Photoheterotrophic Capabilities in Marine Pyrrhophyta,
W80-04285 5C

Integration of Biological with Thermal Criteria for Power Plant Design and Water Resource Use,
W80-04289 5C

Growth of the Aquatic Plant Myriophyllum Spicatum in a Littoral Area of the Hudson River Estuary,
W80-04349 2I

Outdoor Algal Mass Cultures-II. Photosynthetic Yield Limitations,
W80-04358 5C

Growth Responses of Selected Freshwater Algae to Trace Elements and Scrubber Ash Slurry Generated by Coal-Fired Power Plants,
W80-04386 5C

Effects of Salinity on Vegetation Consumption and Growth in Grass Carp,
W80-04395 5A

Steady-State Growth and Chemical Composition of the Marine Chlorophyte Dunaliella Tertiolecta in Nitrogen-Limited Continuous Cultures,
W80-04456 5C

Applicability of Cellular Equilibrium and Monod Theory to Phytoplankton Growth Kinetics,
W80-04465 5C

HABITATS

Population Structure and Species Composition of the Free-Living Nematodes Inhabiting Sands of the New York Bight Apex,
W80-04391 5C

HARVESTING OF ALGAE

A Computational Model for Growth and Harvesting of the Marine Alga Ascophyllum Nodosum,
W80-04461 5C

HAZARDS

Sedimentology and Geochemistry of Surface Sediments and the Distribution of Faults and Potentially Unstable Sediments, St. George Basin Region of the Outer Continental Shelf, Southern Bering Sea,
W80-04428 5C

Coastal Processes and Morphology of the Bering Sea Coast of Alaska,
W80-04430 5C

Environmental Concerns for OTEC Identified in the DOE OTEC Environmental Readiness Document,
W80-04438 5C

HCB

Chlorinated Hydrocarbons in Fish-Eating Birds from the Gdansk Bay, Baltic Sea,
W80-04419 5B

HEAT PUMPS

Ground Water Heat Pumps - A Cost Comparison,
W80-04424 6B

HEATED WATER

Integration of Biological with Thermal Criteria for Power Plant Design and Water Resource Use,
W80-04289 5C

HEAVY METALS

Diversity and Indicator Species as Measures of Water Pollution in a Subarctic Lake,
W80-04346 5C

A Comparison of the Acute Toxicities of Ten Heavy Metals to Phytoplankton from Saanich Inlet, B.C., Canada,
W80-04398 5C

Behavioural Studies on Mussels Under Changing Environmental Conditions,
W80-04404 5A

Seasonal and Environmental Variation in Mn, Fe, Cu and Zn Content of Spartina Alterniflora,
W80-04411 5A

Toxicity of Heavy Metals to the Marine Diatom Ditylum Brightwellii (West) Grunow: Correlation Between Toxicity and Metal Speciation,
W80-04414 5A

HERBICIDES

Loss of Fluometuron in Runoff Water,
W80-04309 5B

HERMIT CRAB

The Influence of Salinity on Behaviour and Oxygen Uptake of the Hermit Crab Pagurus Bernhardus L.,
W80-04412 5C

HERRINGS

Development and Survival of Embryos of Lake Herring at Different Constant Oxygen Concentrations and Temperatures,
W80-04394 5C

HETCH HETCHY VALLEY (CA)

The California Water Atlas.
W80-04444 2A

HETEROTROPHY

An Investigation of Heterotrophic and Photoheterotrophic Capabilities in Marine Pyrrhophyta,
W80-04285 5C

HILLSBOROUGH COUNTY (FLA)

Hydrologic Data for the Morris Bridge Well-Field Area, Hillsborough County, Florida, 1971-78,
W80-04372 2F

HIMALAYA MOUNTAINS

Effects of Increased Land-Use Upon Freshwaters in the Central Himalayas,
W80-04312 2E

HUDSON RIVER ESTUARY (NY)

Growth of the Aquatic Plant Myriophyllum Spicatum in a Littoral Area of the Hudson River Estuary,
W80-04349 2I

HYDRAULIC JUMP

Submerged Radial Hydraulic Jump,
W80-04311 8B

HYDRODYNAMICS

Application of Recent Results in Functional Analysis to the Problem of Water Tables,
W80-04214 2F

HYDROGEOLOGY

Hydrologic and Geologic Data from the Upper East Coast Planning Area, Southeast Florida,
W80-04381 2F

Hydrologic and Related Data for Water-Supply Planning in an Intensive-Study Area, Northeastern Wichita County, Kansas,
W80-04385 4B

HYDROLOGIC BUDGET

Monthly and Annual Water Budgets of Lake Wingra, Madison, Wisconsin, 1972-77,
W80-04369 2H

HYDROLOGIC DATA

Water Resources Data for Idaho, Water Year 1978--Volume 1. Great Basin and Snake River Basin Above King Hill.
W80-04366 7C

Water Resources Data for Idaho, Water Year 1978--Volume 2. Upper Columbia River Basin and Snake River Basin Below King Hill.
W80-04367 7C

Rainfall-Runoff Data from Small Watersheds in Colorado, October 1974 Through September 1977,
W80-04371 7C

Summary of Hydrologic Data for Tampa Bypass Canal System, July 1974 to September 1976,
W80-04373 8B

Hydrologic Conditions in Broward County, Florida, 1976,
W80-04378 7C

Hydrologic and Geologic Data from the Upper East Coast Planning Area, Southeast Florida,
W80-04381 2F

Hydrologic and Related Data for Water-Supply Planning in an Intensive-Study Area, Northeastern Wichita County, Kansas,
W80-04385 4B

HYDROLOGY
The Effects of Land Use and Hydrology on Groundwater Quality in Mid-Canterbury, New Zealand,
W80-04261 5A

Quantitative Determination of the Subglacial Hydrology of Two Alpine Glaciers,
W80-04338 2C

HYPOLIMNION
Oxygen Depletion in Lake Erie: Has There Been Any Change,
W80-04225 2H

ICE
Symposium on Glacier Beds: The Ice-Rock Interface.
W80-04313 2C

The Flow of Ice, Treated as a Newtonian Viscous Liquid, Around a Cylindrical Obstacle Near the Bed of a Glacier,
W80-04320 2C

A Mathematical Approach to the Theory of Glacier Sliding,
W80-04321 2C

Empirical Studies of Ice Sliding,
W80-04323 2C

On the Origin of Stratified Debris in Ice Cores from the Bottom of the Antarctic Ice Sheet,
W80-04325 2C

The Debris-Laden Ice at the Bottom of the Greenland Ice Sheet,
W80-04326 2C

Discontinuous Flow, Ice Texture, and Dirt Content in the Basal Layers of the Devon Island Ice Cap,
W80-04327 2C

Depolarization of Radio Waves Can Distinguish Between Floating and Grounded Ice Sheets,
W80-04328 2C

Pressure-Melting Effects in Basal Ice of Temperate Glaciers: Laboratory Studies and Field Observations Under Glacier D'Argentiere,
W80-04331 2C

Observations Within Cavities at the Bed of the Glacier Osterdalsisen, Norway,
W80-04332 2C

Dynamics of Near Shore Ice,
W80-04427 5C

ICE CORES
The Debris-Laden Ice at the Bottom of the Greenland Ice Sheet,
W80-04326 2C

Discontinuous Flow, Ice Texture, and Dirt Content in the Basal Layers of the Devon Island Ice Cap,
W80-04327 2C

ICEQUAKES
Seismic Evidence for Discrete Glacier Motion at the Rock-Ice Interface,
W80-04324 2C

IDAHO
Water Resources Data for Idaho, Water Year 1978--Volume 1. Great Basin and Snake River Basin Above King Hill.
W80-04366 7C

Water Resources Data for Idaho, Water Year 1978--Volume 2. Upper Columbia River Basin and Snake River Basin Below King Hill.

LEIOSTOMUS
Effects of Chlorobrominated and Chlorinated Cooling Waters on Estuarine Organisms,
W80-04393 5C

LIFE HISTORY STUDIES
Notes on the Growth and Sporulation of a Natural Population of Aphanizomenon Flos-Aquae,
W80-04353 5C

LIGHT
An Investigation of Heterotrophic and Photoheterotrophic Capabilities in Marine Pyrrhophyta,
W80-04285 5C

An Analytical Integration Method of Computing Diurnal Primary Production from Steele's Light Response Curve,
W80-04464 5C

LIGHT INTENSITY
Outdoor Algal Mass Cultures-II. Photosynthetic Yield Limitations,
W80-04358 5C

Mechanisms of Rapid Photosynthetic Adaptation in Natural Phytoplankton Communities. I. Redistribution of Excitation Energy Between Photosystems I and II,
W80-04452 5C

LIMANDA
Correlation Between Cadmium Concentration in the Water and Tissue Residue Levels in Dab,

Limanda Limanda L., and Plaice, Pleuronectes Platessa L.,
W80-04407 5A

LIMITING FACTORS
Steady-State Growth and Chemical Composition of the Marine Chlorophyte Dunaliella Tertiolecta in Nitrogen-Limited Continuous Cultures,
W80-04456 5C

LINDANE
Pesticide Residues in Lake Balaton,
W80-04402 5B

LINEAR ALKYLATE SULFONATES
Interactions Between Vascular Actions of Detergent and Catecholamines in Perfused Gills of European Eel, Anguilla Anguilla L. and Brown Trout, Salmo Trutta, L.,
W80-04388 5A

An Aquatic Safety Assessment on Linear Alkylbenzene Sulfonate (LAS): Chronic Effects on Fathead Minnows,
W80-04420 5A

LIQUID WASTES
Active Waste-Injection Systems in Florida, 1976,
W80-04368 5B

LITTLE TRAVERSE BAY (MI)
Mineralogy and Distribution of Fine-Grained Sediments in Little Traverse Bay, Lake Michigan,
W80-04218 2J

LITTORAL
Effectiveness of Submersed Angiosperm-Epiphyte Complexes on Exchange of Nutrients and Organic Carbon in Littoral Systems. III. Refractory Organic Carbon,
W80-04348 5B

Factors Causing Elevated Biological Oxygen Demand in the Littoral Zone of Lake Wingra, Wisconsin,
W80-04457 5C

LONG ISLAND SOUND (NY)
The Flax Pond Ecosystem Study: Exchanges of Inorganic Nitrogen Between an Estuarine Marsh and Long Island Sound,
W80-04389 2L

LOUGH NEAGH (IRELAND)
Sources of Phosphorus in the Lough Neagh System and Their Reduction,
W80-04227 5B

LOUGH NEAGH (NORTHERN IRELAND)
Notes on the Growth and Sporulation of a Natural Population of Aphanizomenon Flos-Aquae,
W80-04353 5C

LOWER NEW YORK BAY
Salinity Influence on the Ecology of Phytoflagellate Blooms in Lower New York Bay and Adjacent Waters,
W80-04351 5C

MACROPHYTES
Effectiveness of Submersed Angiosperm-Epiphyte Complexes on Exchange of Nutrients and Organic Carbon in Littoral Systems. III. Refractory Organic Carbon,
W80-04348 5B

Factors Causing Elevated Biological Oxygen Demand in the Littoral Zone of Lake Wingra, Wisconsin,
W80-04457 5C

MAINE
Descriptive and Comparative Studies of Maine Lakes,
W80-04286 2H

Down Easters Head for the Bedrock.
W80-04434 8A

MAMMALS
Trophic Relationships Among Ice Inhabiting Phocid Seals and Functionally Related Marine Mammals,
W80-04423 5C

MANGANESE
The Relation Between Pore Water Chemistry and Benthic Fluxes of Nutrients and Manganese in Narragansett Bay, Rhode Island,
W80-04251 2L

MAPS
The California Water Atlas.
W80-04444 2A

MARINE ALGAE
A Study of the Role of the Seagrass Posidonia Australis in the Carbon Budget of an Estuary,
W80-04278 5C

Reflectance Spectroscopy of Marine Phytoplankton. Part I. Optical Properties as Related to Age and Growth Rate,
W80-04279 5C

Salinity Influence on the Ecology of Phytoflagellate Blooms in Lower New York Bay and Adjacent Waters,
W80-04351 5C

MARINE FISH
The Sea-Water Well System at the Fisheries Laboratory, Lowestoft and the Methods in Use for Keeping Marine Fish,
W80-04415 5A

MARINE FISHERIES
International Ramifications of the Fishery Conservation and Management Act of 1976,
W80-04479 6E

MARINE MICROORGANISMS
Influence of Amazon River Discharge on the Marine Production System Off Barbados, West Indies,
W80-04275 5C

MARSH PLANTS
Seasonal and Environmental Variation in Mn, Fe, Cu and Zn Content of Spartina Alterniflora,
W80-04411 5A

MASS TRANSFER
Estimates of Lake St. Clair Evaporation,
W80-04217 2D

Assessment of the Quality of Generalized Wind Functions in Penman's Equations,
W80-04230 2D

Groundwater Transport of a Salt Tracer Through a Sandy Lakebed,
W80-04250 2A

MASURIAN LAKES (POLAND)
Lake Macrophytes as the Food of Roach (Rutilus Rutilus L.) and Rudd (Scardinius Erythrophthalmus L.) I. Species Composition and Dominance Relations in the Lake and Food,
W80-04364 5C

MATHEMATICAL MODELS
Land and Water Resources Planning Using Goal Programming,
W80-04202 6A

Environmental Management of Multipurpose Reservoirs Subject to Fluctuating Flood Pools,
W80-04204 6G

Coordination of Overlapping Hierarchical Water Resources Systems,
W80-04292 6A

A Hierarchical Multiobjective Method for Water Resources Planning,
W80-04293 6A

Verification of the Water Quality Impacts of Combined Sewer Overflow,
W80-04299 5B

Groundwater Utilization, South Fork of Long Island,
W80-04302 2F

A Mathematical Approach to the Theory of Glacier Sliding,
W80-04321 2C

Toxicity of Heavy Metals to the Marine Diatom Ditylum Brightwellii (West) Grunow: Correlation Between Toxicity and Metal Speciation,
W80-04414 5A

A Time- and Depth-Dependent Model for Physical, Chemical and Biological Cycles in Temperate Lakes,
W80-04460 5C

A Computational Model for Growth and Harvesting of the Marine Alga Ascophyllum Nodosum,
W80-04461 5C

MATHEMATICAL STUDIES
The Flow of Ice, Treated as a Newtonian Viscous Liquid, Around a Cylindrical Obstacle Near the Bed of a Glacier,
W80-04320 2C

An Analytical Integration Method of Computing Diurnal Primary Production from Steele's Light Response Curve,
W80-04464 5C

MEASUREMENT
Automatic Measurement of Soil-Water Pressure Using a Capacitance Manometer,
W80-04305 7B

MEATWORKS-FELLMONGERY WASTES
The Effects of Irrigation with Meatworks-Fellmongery Effluent on Water Quality in the Unsaturated Zone and Shallow Aquifer,
W80-04262 3C

MEDITERRANEAN SEA
Mercury in Water, Organisms and Sediments from a Section of the Turkish Mediterranean Coast,
W80-04417 5B

MELT WATER
Sediment Concentration in Melt Waters as an Indicator of Erosion Processes Beneath an Alpine Glacier,
W80-04330 2C

MELTING
Pressure-Melting Effects in Basal Ice of Temperate Glaciers: Laboratory Studies and Field Observations Under Glacier D'Argentiere,
W80-04331 2C

MERCURY
Bioaccumulation and Bioamplification of Mercury Compounds in a Third Level Consumer, Salmo Gairdneri, Influence of the Temperature Factor (In French),
W80-04396 5B

The Effects of Interacting Salinity, Cadmium, and Mercury on Population Growth of an Archiannelid, Dinophilus Gyrociliatus,
W80-04403 5A

Mercury in Water, Organisms and Sediments from a Section of the Turkish Mediterranean Coast,
W80-04417 5B

METABOLISM
Sodium and Potassium Ions Effects on Phosphorus Transport in Algal Cells,
W80-04392 5C

Applicability of Cellular Equilibrium and Monod Theory to Phytoplankton Growth Kinetics,
W80-04465 5C

METHANE
Methane Addition to an Arctic Lake in Winter,
W80-04308 5B

METHODOLOGY
Staining Preparations for Phytoplankton and Periphyton,
W80-04365 7C

Evaluation of Methods for Estimating Ground-Water Withdrawals in Western Kansas,
W80-04370 4B

An Analytical Integration Method of Computing Diurnal Primary Production from Steele's Light Response Curve,
W80-04464 5C

MICROCYSTIS
Sodium and Potassium Ions Effects on Phosphorus Transport in Algal Cells,
W80-04392 5C

MIGRATORY BIRDS
Chlorinated Hydrocarbons in Fish-Eating Birds from the Gdansk Bay, Baltic Sea,
W80-04419 5B

MILITARY ASPECTS
Dispute Settlement in the Law of the Sea Convention: The Military Activities Exception,
W80-04474 6E

MILWAUKEE RIVER
Verification of the Water Quality Impacts of Combined Sewer Overflow,
W80-04299 5B

MINE DRAINAGE
Ion Exchange Recovery of Cobalt and Copper from Blackbird Mine Drainage,
W80-04296 5D

MINE WASTES
The Process of Fish Fauna Restoration in the River Pek Following the Catastrophic Outbreak of Gangue from the Copper Mines 'Majdanpek' in Yugoslavia,
W80-04400 5C

MINERALOGY
Mineralogy and Distribution of Fine-Grained Sediments in Little Traverse Bay, Lake Michigan,
W80-04218 2J

MINING
Seafloor Sand Mining in Japan,
W80-04437 5C

MINNOWS
An Aquatic Safety Assessment on Linear Alkylbenzene Sulfonate (LAS): Chronic Effects on Fathead Minnows,
W80-04420 5A

MIXING
A Time- and Depth-Dependent Model for Physical, Chemical and Biological Cycles in Temperate Lakes,
W80-04460 5C

MODEL STUDIES
Approximate Flood Routing Methods: A Review,
W80-04208 2E

Coupling of Internal Wave Motion with Entrainment at the Density Interface of a Two-Layer Lake,
W80-04209 2H

Estimation of Soil Moisture at Deeper Depth from Surface Layer Data,
W80-04236 2G

Studies of Silver Iodide Ice-Forming Activity: Verification of Theory,
W80-04244 2B

Modelling and Analysis of Data from Catchment Studies of Land Use Change,
W80-04254 2A

Hybrid Approach in Water Quality Management,
W80-04256 5G

Land Capability for Surface Water Production,
W80-04257 4A

Coordination of Overlapping Hierarchical Water Resources Systems,
W80-04292 6A

A Hierarchical Multiobjective Method for Water Resources Planning,
W80-04293 6A

Some Basic Concepts of Wave Sediment Transport,
W80-04304 2J

Design Criteria for Cooling-Water Outlet Structures,
W80-04310 5B

A Theoretical Model of Glacial Abrasion,
W80-04315 2C

Simulated Glacial Abrasion,
W80-04316 2C

Local Friction Laws for Glaciers: A Critical Review and New Openings,
W80-04318 2C

Simulated Glacier Sliding Over an Obstacle,
W80-04322 2C

Oil Spill Trajectory Analysis Lower Cook Inlet, Alaska,
W80-04431 5C

Model Coastal Zone Statute,
W80-04492 6E

MONITORING
Active Waste-Injection Systems in Florida, 1976,
W80-04368 5B

A Proposed Ground Water Quality Monitoring Network for Idaho,
W80-04374 7A

Remote Sensing Evidence and Environmental Law,
W80-04468 6E

MONO LAKE (CA)
Fallout Plutonium in an Alkaline, Saline Lake,
W80-04306 2H

MONOD EQUATION
Applicability of Cellular Equilibrium and Monod Theory to Phytoplankton Growth Kinetics,
W80-04465 5C

MONSOONS
Trace Elements in Monsoon Rains at Bombay and Over the Arabian Sea,
W80-04240 2K

MORPHOLOGY
Oil Spill Vulnerability, Coastal Morphology, and Sedimentation of the Kodiak Archipelago,
W80-04426 5C

Coastal Processes and Morphology of the Bering Sea Coast of Alaska,
W80-04430 5C

MOUNTAINS
Effects of Increased Land-Use Upon Freshwaters in the Central Himalayas,
W80-04312 2E

MOVEMENT
Simulated Glacier Sliding Over an Obstacle,
W80-04322 2C

Observations Within Cavities at the Bed of the Glacier Osterdalsisen, Norway,
W80-04332 2C

MULTIVARIATE ANALYSIS
The Effects of Interacting Salinity, Cadmium, and Mercury on Population Growth of an Archiannelid, Dinophilus Gyrociliatus,
W80-04403 5A

MUSSELS
Behavioural Studies on Mussels Under Changing Environmental Conditions,
W80-04404 5A

Effect of Some Pesticides on the Rhythmic Adductor Muscle Activity of Fresh-Water Mussel Larvae,
W80-04406 5A

Mortality, Growth and Fecundity of Transplanted Mussel and Barnacle Populations Near a Pulp Mill Outfall,
W80-04418 5C

MYRIOPHYLLUM SPICATUM
Growth of the Aquatic Plant Myriophyllum Spicatum in a Littoral Area of the Hudson River Estuary,
W80-04349 2I

MYTILUS
Mortality, Growth and Fecundity of Transplanted Mussel and Barnacle Populations Near a Pulp Mill Outfall,
W80-04418 5C

NARRAGANSETT BAY (RI)
The Relation Between Pore Water Chemistry and Benthic Fluxes of Nutrients and Manganese in Narragansett Bay, Rhode Island,
W80-04251 2L

NATIONAL EUTROPHICATION SURVEY
A Compendium of Lake and Reservoir Data Collected by the National Eutrophication Survey in Eastern North-Central, and Southeastern United States.
W80-04458 5C

NATIONAL FORESTS
The Winters Doctrine on Reserved Water Rights in Idaho: Avondale Irrigation District V. North Idaho Properties, Inc.,
W80-04486 6E

NEBRASKA
The Irrigation Revolution and Its Environmental Consequences,
W80-04490 6E

NEMATODES
Population Structure and Species Composition of the Free-Living Nematodes Inhabiting Sands of the New York Bight Apex,
W80-04391 5C

NETWORK DESIGN
A Proposed Ground Water Quality Monitoring Network for Idaho,
W80-04374 7A

NEW YORK BIGHT
Distribution, Fluxes and Biological Utilization of Inorganic Nitrogen During a Spring Bloom in the New York Bight,
W80-04274 5C

NEW YORK BRIGHT
Salinity Influence on the Ecology of Phytoflagellate Blooms in Lower New York Bay and Adjacent Waters,
W80-04351 5C

NEW ZEALAND
An Effective Antifreeze for Storage Raingauges,
W80-04243 2B

Yield and Macronutrient Content of Water in Relation to Plant Cover from the Snow Tussock Grassland Zone of Eastern and Central Otago, New Zealand,
W80-04260 2A

The Effects of Land Use and Hydrology on Groundwater Quality in Mid-Canterbury, New Zealand,
W80-04261 5A

Nitrate and Chloride in Groundwater, Surface Water and Deep Soil Profiles of Central Canterbury, New Zealand,
W80-04264 5A

Nitrate Removal from Streams Draining Experimental Catchments,
W80-04265 5B

Nutrient Concentrations in Run-Off from a Gley Podzol Soil,
W80-04267 5B

Losses of Phosphorus and Nitrogen Forms in Subsurface Drainage Water as Influenced by Phosphate Fertilizer, Grazing Animals, and Irrigation Treatments,
W80-04268 5B

Factors Affecting Downslope Movement of Nutrients in Hill Pasture,
W80-04269 5B

NEWPORT RIVER ESTUARY (NC)
The Role of Zooplankton in the Nitrogen Dynamics of a Shallow Estuary,
W80-04448 5C

NISQUALLY GLACIER (WA)
Energy Dissipation During Subglacial Abrasion at Nisqually Glacier, Washington, U.S.A.,
W80-04329 2C

NITRATES
Nitrate and Chloride in Groundwater, Surface Water and Deep Soil Profiles of Central Canterbury, New Zealand,
W80-04264 5A

Nitrate Removal from Streams Draining Experimental Catchments,
W80-04265 5B

Modelling Nitrate Concentrations in Pumped Storage Reservoirs,
W80-04266 5G

Distribution, Fluxes and Biological Utilization of Inorganic Nitrogen During a Spring Bloom in the New York Bight,
W80-04274 5C

Ground-Water Quality in the Upper Santa Ana River Basin, Southern California,
W80-04383 5B

NITROGEN
Losses of Phosphorus and Nitrogen Forms in Subsurface Drainage Water as Influenced by Phosphate Fertilizer, Grazing Animals, and Irrigation Treatments,
W80-04268 5B

Restoration of Lake Nakskov Indrefjord, Denmark, Using Algal Ponds to Remove Nutrients from Inflowing River Water,
W80-04288 5F

The Flax Pond Ecosystem Study: Exchanges of Inorganic Nitrogen Between an Estuarine Marsh and Long Island Sound,
W80-04389 2L

Steady-State Growth and Chemical Composition of the Marine Chlorophyte Dunaliella Tertiolecta in Nitrogen-Limited Continuous Cultures,
W80-04456 5C

NITROGEN CYCLE
Distribution, Fluxes and Biological Utilization of Inorganic Nitrogen During a Spring Bloom in the New York Bight,
W80-04274 5C

Occurrence of Nitric and Nitrous Oxides in a Coastal Marine Sediment,
W80-04362 2K

NITROGEN FIXATION
Nitrogen Fixation in a Nitrogen-Limited Impoundment,
W80-04360 5C

NONBLUE-GREEN ALGAE
An Empirical Study of Factors Affecting Blue-Green Versus Nonblue-Green Algal Dominance in Lakes,
W80-04441 5C

NONPOINT POLLUTION
Rural Nonpoint Source Water Quality in a Southeastern Watershed,
W80-04221 5B

NORADRENALINE
Interactions Between Vascular Actions of Detergent and Catecholamines in Perfused Gills of European Eel, Anguilla Anguilla L. and Brown Trout, Salmo Trutta, L.,
W80-04388 5A

NORTH CAROLINA
Rural Nonpoint Source Water Quality in a Southeastern Watershed,
W80-04221 5B

NORTH EQUATORIAL CURRENT
Dissolved and Particulate Organic Carbon in the North Equatorial Current of the Atlantic Ocean,
W80-04283 5C

NORTH SEA

Nutrient Concentrations in Run-Off from a Gley Podzol Soil,
W80-04267 5B

Factors Affecting Downslope Movement of Nutrients in Hill Pasture,
W80-04269 5B

Spray Irrigation of Dairy Factory Wastewater Onto Pasture--A Case Study,
W80-04271 5B

PATH OF POLLUTANTS
Bioaccumulation and Bioamplification of Mercury Compounds in a Third Level Consumer, Salmo Gairdneri, Influence of the Temperature Factor (In French),
W80-04396 5B

PATHOGENIC BACTERIA
Isolation and Identification of Pathogenic Naegleria from Florida Lakes,
W80-04277 5C

PENMAN'S EQUATIONS
Assessment of the Quality of Generalized Wind Functions in Penman's Equations,
W80-04230 2D

PERIPHYTON
Staining Preparations for Phytoplankton and Periphyton,
W80-04365 7C

The Use of Periphyton from Lake Zurich to Extimate the Algal Growth Potential in River Limmat Water,
W80-04446 5C

PERMAFROST
Model Application to Urban Groundwater Problems of Fairbanks, Alaska,
W80-04295 2F

PESCADERO AREA (CALIF)
The Potential for Developing Ground-Water Supplies in the Pescadero Area, San Mateo County, California,
W80-04384 6D

PESTICIDE RESIDUES
Pesticide Residues in Lake Balaton,
W80-04402 5B

Chlorinated Hydrocarbons in Fish-Eating Birds from the Gdansk Bay, Baltic Sea,
W80-04419 5B

PESTICIDE TOXICITY
Effect of Certain Organochlor Insecticides on Primary Production in a Freshwater Pond,
W80-04401 5C

Effect of Some Pesticides on the Rhythmic Adductor Muscle Activity of Fresh-Water Mussel Larvae,
W80-04406 5A

Effect of Organophosphate Insecticide 'Owadofos Plynny-50' (Fenitrothion) on Bioelectric Changes in Cardiac Muscle of Eel, Anguilla Anguilla L.,
W80-04416 5C

PESTICIDES
Evaluation of Protocols for Pesticides and PCB's in Raw Wastewater,
W80-04300 5A

Loss of Fluometuron in Runoff Water,
W80-04309 5B

PHENOLS
Anaerobic-Activated Carbon Filters for the Removal of Refractory and Toxic Organic Compounds in Wastewater,
W80-04205 5D

PHOSPHATES
Buffering of Silica and Phosphate in a Turbid River,
W80-04252 5B

Phosphate Requirement of Anabaena Oscillarioides and Its Ecological Implications,
W80-04454 5C

PHOSPHORUS
A Simple Reflectance Method for the Measurement of Particulate Pigment in Lake Water and Its Application to Phosphorus-Chlorophyll-Seston Relationships,
W80-04224 2H

Sources of Phosphorus in the Lough Neagh System and Their Reduction,
W80-04227 5B

Availability to Scenedesmus Quadricauda of Different Forms of Phosphorus in Sedimentary Materials from the Great Lakes,
W80-04253 5C

Losses of Phosphorus and Nitrogen Forms in Subsurface Drainage Water as Influenced by Phosphate Fertilizer, Grazing Animals, and Irrigation Treatments,
W80-04268 5B

Effects of Rural and Urban Sources of Phosphorus of Lake Burley Griffin,
W80-04270 5B

Changes in Phosphorus Concentration in a Eutrophic Lake as a Result of Macrophyte-Kill Following Herbicide Application,
W80-04276 5C

Restoration of Lake Nakskov Indrefjord, Denmark, Using Algal Ponds to Remove Nutrients from Inflowing River Water,
W80-04288 5F

Role of Sedimentation in the Phosphorus Budget of Natural and Artificial Iowa Lakes,
W80-04294 2H

Phosphorus in a Model Pond Study: I Sediment Selection and Preparation,
W80-04343 5C

A Statistical Model for Small Lake Water Quality Management,
W80-04359 5C

Sodium and Potassium Ions Effects on Phosphorus Transport in Algal Cells,
W80-04392 5C

PHOTOSYNTHESIS
Outdoor Algal Mass Cultures-II. Photosynthetic Yield Limitations,
W80-04358 5C

Mechanisms of Rapid Photosynthetic Adaptation in Natural Phytoplankton Communities. I. Redistribution of Excitation Energy Between Photosystems I and II,
W80-04452 5C

Ultraviolet Radiation and Phytoplankton Photosynthesis,
W80-04462 5C

PHYSICAL PROPERTIES
A Time- and Depth-Dependent Model for Physical, Chemical and Biological Cycles in Temperate Lakes,
W80-04460 5C

PHYSICOCHEMICAL PROPERTIES
The Influence of Thick Floating Vegetation (Water Hyacinth: Eichhornia Crassipes) on the Physico-Chemical Environment of a Fresh Water Wetland,
W80-04342 5C

PHYTOPLANKTON
Distribution, Fluxes and Biological Utilization of Inorganic Nitrogen During a Spring Bloom in the New York Bight,
W80-04274 5C

Reflectance Spectroscopy of Marine Phytoplankton. Part 2. A Simple Model of Ocean Color,
W80-04280 5C

A Simple Tubular Phytoplankton Sampler for Vertical Profiling in Lakes,
W80-04344 7B

Description and Use of an Improved Method for Determining Estuarine Zooplankton Grazing Rates on Phytoplankton,
W80-04357 5A

The Seasonal Cycle of the Phytoplankton in the Coastal Waters of Ghana,
W80-04361 5C

Dynamics and Succession of the Phytoplankton in a Tropical Lake: Lake Lanao, Phillipines,
W80-04363 5C

Staining Preparations for Phytoplankton and Periphyton,
W80-04365 7C

A Comparison of the Acute Toxicities of Ten Heavy Metals to Phytoplankton from Saanich Inlet, B.C., Canada,
W80-04398 5C

Diel Patterns of Phytoplankton Productivity and Extracellular Release in Ultra-Oligotrophic Lake Tahoe,
W80-04399 5C

Effect of Certain Organochlor Insecticides on Primary Production in a Freshwater Pond,
W80-04401 5C

Mechanisms of Rapid Photosynthetic Adaptation in Natural Phytoplankton Communities. I. Redistribution of Excitation Energy Between Photosystems I and II,
W80-04452 5C

Ultraviolet Radiation and Phytoplankton Photosynthesis,
W80-04462 5C

Applicability of Cellular Equilibrium and Monod Theory to Phytoplankton Growth Kinetics,
W80-04465 5C

PLAICE
Correlation Between Cadmium Concentration in the Water and Tissue Residue Levels in Dab, Limanda Limanda L., and Plaice, Pleuronectes Platessa L.,
W80-04407 5A

PLANKTON
Effects of Continuous Chlorination on Entrained Estuarine Plankton,
W80-04220 2L

Spatial Patterns in North Sea Plankton,
W80-04450 5C

PLANKTON NETS
Studies on the Usefulness of Different Mesh-Size Plankton Nets for Thickening Zooplankton,
W80-04445 5C

PLANNING
Coordination of Overlapping Hierarchical Water Resources Systems,
W80-04292 6A

A Hierarchical Multiobjective Method for Water Resources Planning,
W80-04293 6A

Hydrologic and Geologic Data from the Upper East Coast Planning Area, Southeast Florida,
W80-04381 2F

Hydrologic and Related Data for Water-Supply Planning in an Intensive-Study Area, Northeastern Wichita County, Kansas,
W80-04385 4B

PLANT DISEASES
Plant Pathogens as Agents for Biological and Integrated Control of Aquatic Plants,
W80-04290 5B

PLANT PATHOLOGY
Plant Pathogens as Agents for Biological and Integrated Control of Aquatic Plants,
W80-04290 5B

PLANT POPULATIONS
Dynamics and Succession of the Phytoplankton in a Tropical Lake: Lake Lanao, Phillipines,
W80-04363 5C

PLANT TISSUES
Inorganic Mineral Nutrient Level Studies on Potamogeton Pectinatus L. and Enteromorpha Prolifera in Forfar Loch, Scotland,
W80-04356 5C

PLEURONECTES
Correlation Between Cadmium Concentration in the Water and Tissue Residue Levels in Dab, Limanda Limanda L., and Plaice, Pleuronectes Platessa L.,
W80-04407 5A

POLLUTANT IDENTIFICATION
Evaluation of Protocols for Pesticides and PCB's in Raw Wastewater,
W80-04300 5A

POLLUTANTS
Organic Contaminant Behavior During Groundwater Recharge,
W80-04219 5A

Quality of Surface Water on Sanibel Island, Florida, 1976-77,
W80-04377 5B

POLLUTION ABATEMENT
The Emergency Powers in the Environmental Protection Statutes: A Suggestion for a Unified Emergency Provision,
W80-04496 6E

POLYCHAETES
Copper-The Major Metal Component of Glycerid Polychaete Jaws,
W80-04413 5B

PONDING TIME
Constant-Rainfall Infiltration,
W80-04232 2G

PONDWEEDS
Inorganic Mineral Nutrient Level Studies on Potamogeton Pectinatus L. and Enteromorpha Prolifera in Forfar Loch, Scotland,
W80-04356 5C

POPULATION
Diversity and Indicator Species as Measures of Water Pollution in a Subarctic Lake,
W80-04346 5C

POPULATION DYNAMICS
The Seasonal Cycle of the Phytoplankton in the Coastal Waters of Ghana,
W80-04361 5C

Spatial Patterns in North Sea Plankton,
W80-04450 5C

PORE PRESSURE
Automatic Measurement of Soil-Water Pressure Using a Capacitance Manometer,
W80-04305 7B

PORE WATER
The Relation Between Pore Water Chemistry and Benthic Fluxes of Nutrients and Manganese in Narragansett Bay, Rhode Island,
W80-04251 2L

PORT HACKING (AUSTRALIA)
A Study of the Role of the Seagrass Posidonia Australis in the Carbon Budget of an Estuary,
W80-04278 5C

POTABLE WATER
Water Quality Committee (Annual Review of Activities - 1975).
W80-04484 6E

POTASSIUM
Response of the Tench (Tinca Tinca L.) to Potassium Nitrate Enriched Water,
W80-04387 5B

POTENTIAL FLOW
Application of Recent Results in Functional Analysis to the Problem of Water Tables,
W80-04214 2F

POTENTIAL SITE RETENTION
Runoff Curve Numbers from Partial Area Watersheds,
W80-04207 2E

PRECIPITATION (ATMOSPHERIC)
Acid Precipitation in the Western United States,
W80-04213 2K

PRECIPITATION EXCESS
Effective Rainfall Estimation,
W80-04231 2G

PREFERENCES (WATER RIGHTS)
An International Comparison of Trends in Water Resources Management,
W80-04498 6E

PRESERVATION
NOAA's Marine Sanctuary Program,
W80-04485 6E

PRESSURE
Pressure-Melting Effects in Basal Ice of Temperate Glaciers: Laboratory Studies and Field Observations Under Glacier D'Argentiere,
W80-04331 2C

PRESSURE MEASURING INSTRUMENTS
Automatic Measurement of Soil-Water Pressure Using a Capacitance Manometer,
W80-04305 7B

PRIMARY PRODUCTIVITY
Influence of Amazon River Discharge on the Marine Production System Off Barbados, West Indies,
W80-04275 5C

Diurnal Oxygen Rhythm and Primary Production in the Mixed Layer of the Atlantic Ocean at 20 Degrees N,

Current C14 Methods for Measuring Primary Production: Gross Underestimates in Oceanic Waters,
W80-04284 5A

Effect of Certain Organochlor Insecticides on Primary Production in a Freshwater Pond,
W80-04401 5C

A Time- and Depth-Dependent Model for Physical, Chemical and Biological Cycles in Temperate Lakes,
W80-04460 5C

An Analytical Integration Method of Computing Diurnal Primary Production from Steele's Light Response Curve,
W80-04464 5C

PROPANOLOL
Interactions Between Vascular Actions of Detergent and Catecholamines in Perfused Gills of European Eel, Anguilla Anguilla L. and Brown Trout, Salmo Trutta, L.,
W80-04388 5A

PROVO RIVER (UT)
Algal Response to a Thermal Effluent: Study of a Power Station on the Provo River, Utah, USA,
W80-04449 5C

PUBLIC HEALTH
Isolation and Identification of Pathogenic Naegleria from Florida Lakes,
W80-04277 5C

PUBLIC RIGHTS
A Regulated Citizen's Bill of Rights,
W80-04466 6E

PULP WASTES
Mortality, Growth and Fecundity of Transplanted Mussel and Barnacle Populations Near a Pulp Mill Outfall,
W80-04418 5C

PUMPED STORAGE
Modelling Nitrate Concentrations in Pumped Storage Reservoirs,
W80-04266 5G

PYRRHOPHYTA
An Investigation of Heterotrophic and Photoheterotrophic Capabilities in Marine Pyrrhophyta,
W80-04285 5C

RADAR
A New Technique for Measuring Tidal Currents by Using a Two-Site HF Doppler Radar System,
W80-04307 7B

RADIAL FLOW
Submerged Radial Hydraulic Jump,
W80-04311 8B

RADIOISOTOPES
Fallout Plutonium in an Alkaline, Saline Lake,
W80-04306 2H

RAIN GAGES
An Effective Antifreeze for Storage Raingauges,
W80-04243 2B

RAIN WATER
Trace Elements in Monsoon Rains at Bombay and Over the Arabian Sea,
W80-04240 2K

RAINBOW TROUT
Influence of Thermal Challenge on Conditioned Feeding Forays of Juvenile Rainbow Trout,
W80-04405 5C

RAINFALL
The Weather Report Predicts Rain--An Estimation of Where, When, and How Much Rain Will Fall Can Now Be Determined by Frequency Analysis,
W80-04211 2B

Spells of Dry Days Related to Agricultural Drought in India,
W80-04237 2B

Study of Normal Rainfall of Satara District,
W80-04238 2B

RAINFALL-RUNOFF RELATIONSHIPS
Characterization and Models of Watershed Storage,
W80-04233 2E

Rainfall-Runoff Data from Small Watersheds in Colorado, October 1974 Through September 1977,
W80-04371 7C

Stormwater-Runoff Data for a Multifamily Residential Area, Dade County, Florida,
W80-04375 7C

RECHARGE
Agricultural Land Use and Its Effect on Catchment Output of Salt and Water--Evidence from Southern Australia,
W80-04259 2F

RECHARGE WELLS
Organic Contaminant Behavior During Groundwater Recharge,
W80-04219 5A

RECLAMATION
Reclamation Law Constraints on Energy/Industrial Uses of Western Water,
W80-04483 6E

RECREATION
The California Water Atlas.
W80-04444 2A

REEFS
Ammonium Uptake by Symbiotic and Aposymbiotic Reef Corals,
W80-04340 2I

REFLECTANCE
Reflectance Spectroscopy of Marine Phytoplankton. Part I. Optical Properties as Related to Age and Growth Rate,
W80-04279 5C

Reflectance Spectroscopy of Marine Phytoplankton. Part 2. A Simple Model of Ocean Color,
W80-04280 5C

REGIONS
A Compendium of Lake and Reservoir Data Collected by the National Eutrophication Survey in Eastern North-Central, and Southeastern United States.
W80-04458 5C

REMEDIES
Trans-Boundary Pollution Injuries: Jurisdictional Considerations in Private Litigation Between Canada and the United States,
W80-04481 6E

SIZE
Fecundity and Body Size of Planktic Rotifers in 30 Polish Lakes of Various Trophic State,
W80-04451 5C

SMALL WATERSHEDS
Rainfall-Runoff Data from Small Watersheds in Colorado, October 1974 Through September 1977,
W80-04371 7C

SNAKE RIVER BASIN (IDAHO)
Water Resources Data for Idaho, Water Year 1978--Volume 1. Great Basin and Snake River Basin Above King Hill.
W80-04366 7C

SOCIAL IMPACT
Social Equity in Coastal Zone Planning,
W80-04493 6E

SOIL CHEMISTRY
Phosphorus in a Model Pond Study: I Sediment Selection and Preparation,
W80-04343 5C

SOIL CONSERVATION
The Protection of Hydrologic and Land Preservation Values Under the Surface Mining Control and Reclamation Act of 1977: A Welcome Reform,
W80-04471 6E

SOIL MOISTURE
Estimation of Soil Moisture at Deeper Depth from Surface Layer Data,
W80-04236 2G

A Study on Water Availability to the Crops Grown Under Rainfed Conditions in Different Soils at Bijapur,
W80-04239 2G

SOIL TYPES
Phosphorus in a Model Pond Study: I Sediment Selection and Preparation,
W80-04343 5C

SOIL WATER
A Study on Water Availability to the Crops Grown Under Rainfed Conditions in Different Soils at Bijapur,
W80-04239 2G

Automatic Measurement of Soil-Water Pressure Using a Capacitance Manometer,
W80-04305 7B

SOILS
Discontinuous Flow, Ice Texture, and Dirt Content in the Basal Layers of the Devon Island Ice Cap,
W80-04327 2C

SOUTH CASCADE GLACIER (WA)
Direct Measurement of Basal Water Pressures: Progress and Problems,
W80-04335 2C

SOUTHEAST FLORIDA
Hydrologic and Geologic Data from the Upper East Coast Planning Area, Southeast Florida,
W80-04381 2F

SOUTHEASTERN WYOMING
Results of Transient Simulations of a Digital Model of the Arikaree Aquifer Near Wheatland, Southeastern Wyoming,
W80-04379 4B

SPATIAL DISTRIBUTION
Spatial Patterns in North Sea Plankton,
W80-04450 5C

Diatom Associations and Succession in Lake Kariba, South Central Africa,
W80-04455 5C

SPECIATION
An Investigation of Heterotrophic and Photoheterotrophic Capabilities in Marine Pyrrhophyta,
W80-04285 5C

Diversity and Indicator Species as Measures of Water Pollution in a Subarctic Lake,
W80-04346 5C

Diatom Associations and Succession in Lake Kariba, South Central Africa,
W80-04455 5C

SPECIES DIVERSITY
Population Structure and Species Composition of the Free-Living Nematodes Inhabiting Sands of the New York Bight Apex,
W80-04391 5C

SPORES
Notes on the Growth and Sporulation of a Natural Population of Aphanizomenon Flos-Aquae,
W80-04353 5C

SPOT
Effects of Chlorobrominated and Chlorinated Cooling Waters on Estuarine Organisms,
W80-04393 5C

SPRINGS
Karstic Spring Recession Hydrograph and Water Temperature Analysis: Oymapinar Dam Project, Turkey,
W80-04234 2F

STANDING CROPS
Growth of the Aquatic Plant Myriophyllum Spicatum in a Littoral Area of the Hudson River Estuary,
W80-04349 2I

STATE GOVERNMENTS
National Water Quality Inventory 1976 Report to Congress.
W80-04459 5G

Coastal States Organization: The Past and Future,
W80-04494 6E

STATISTICAL MODELS
A Statistical Model for Small Lake Water Quality Management,
W80-04359 5C

STORAGE RAIN GAGES
An Effective Antifreeze for Storage Raingauges,
W80-04243 2B

STORM RUNOFF
Urban Stormwater Management, Proceedings of a Southeast Regional Conference, North Carolina State University, April 10-11, 1979.
W80-04201 4A

Dissolved Oxygen Impact from Urban Storm Runoff,
W80-04297 5B

Stormwater-Runoff Data for a Multifamily Residential Area, Dade County, Florida,
W80-04375 7C

STORM WATER
Urban Stormwater Management, Proceedings of a Southeast Regional Conference, North Carolina State University, April 10-11, 1979.
W80-04201 4A

STORMS
Runoff Curve Numbers from Partial Area Watersheds,
W80-04207 2E

Coastal Processes and Morphology of the Bering Sea Coast of Alaska,
W80-04430 5C

STREAMS
Leaf Litter Processing in a Regulated Rocky Mountain Stream,
W80-04223 2E

Nitrate Removal from Streams Draining Experimental Catchments,
W80-04265 5B

Distribution and Abundance of Attached, Littoral Algae in 21 Lakes and Streams in the Northwest Territories,
W80-04347 5C

STRIP MINE WASTES
The Protection of Hydrologic and Land Preservation Values Under the Surface Mining Control and Reclamation Act of 1977: A Welcome Reform,
W80-04471 6E

STRIP MINING
The Protection of Hydrologic and Land Preservation Values Under the Surface Mining Control and Reclamation Act of 1977: A Welcome Reform,
W80-04471 6E

SUBMERGED FLOW
Submerged Radial Hydraulic Jump,
W80-04311 8B

SUBMERGED PLANTS
The Rates of Dry Matter and Nutrient Loss from Decomposing Potamogeton Pectinatus in a Brackish South-Temperate Coastal Lake,
W80-04355 5C

Lake Macrophytes as the Food of Roach (Rutilus Rutilus L.) and Rudd (Scardinius Erythrophthalmus L.) I. Species Composition and Dominance Relations in the Lake and Food,
W80-04364 5C

SUCCESSION
Dynamics and Succession of the Phytoplankton in a Tropical Lake: Lake Lanao, Phillipines,
W80-04363 5C

Diatom Associations and Succession in Lake Kariba, South Central Africa,
W80-04455 5C

SUNFISHES
Integration of Biological with Thermal Criteria for Power Plant Design and Water Resource Use,
W80-04289 5C

SURFACE-GROUNDWATER RELATIONSHIPS
Groundwater Transport of a Salt Tracer Through a Sandy Lakebed,
W80-04250 2A

Quality of Surface Water on Sanibel Island, Florida, 1976-77,
W80-04377 5B

SURFACE RUNOFF
Runoff Curve Numbers from Partial Area Watersheds,
W80-04207 2E

Dissolved Oxygen Impact from Urban Storm Runoff,
W80-04297 5B

The Protection of Hydrologic and Land Preservation Values Under the Surface Mining Control and Reclamation Act of 1977: A Welcome Reform,
W80-04471 6E

SURFACE WATERS
Nitrate and Chloride in Groundwater, Surface Water and Deep Soil Profiles of Central Canterbury, New Zealand,
W80-04264 5A

Water Resources Data for Idaho, Water Year 1978--Volume 1. Great Basin and Snake River Basin Above King Hill.
W80-04366 7C

Water Resources Data for Idaho, Water Year 1978--Volume 2. Upper Columbia River Basin and Snake River Basin Below King Hill.
W80-04367 7C

Summary of Hydrologic Data for Tampa Bypass Canal System, July 1974 to September 1976,
W80-04373 8B

Water Resources of the Santa Rosa Indian Reservation and Vicinity, Riverside County, California,
W80-04376 4B

Quality of Surface Water on Sanibel Island, Florida, 1976-77,
W80-04377 5B

Hydrologic Conditions in Broward County, Florida, 1976,
W80-04378 7C

SWARTVLEI LAKE (SOUTH AFRICA)
The Rates of Dry Matter and Nutrient Loss from Decomposing Potamogeton Pectinatus in a Brackish South-Temperate Coastal Lake,
W80-04355 5C

SYMBIOSIS
Ammonium Uptake by Symbiotic and Aposymbiotic Reef Corals,
W80-04340 2I

SYSTEMATICS
Classification of Wetlands and Deepwater Habitats of the United States,
W80-04301 6B

TAMAGAWA RIVER
Denitrification by the Sessile Microbial Community of a Polluted River,
W80-04345 5C

TAMPA BYPASS CANAL (FLA)
Summary of Hydrologic Data for Tampa Bypass Canal System, July 1974 to September 1976,
W80-04373 8B

TECHNOLOGY
Percussion Drilling Technologies,
W80-04435 8A

TEMPERATE
A Time- and Depth-Dependent Model for Physical, Chemical and Biological Cycles in Temperate Lakes,
W80-04460 5C

TEMPERATE LAKES
An Empirical Study of Factors Affecting Blue-Green Versus Nonblue-Green Algal Dominance in Lakes,
W80-04441 5C

TENCH
Response of the Tench (Tinca Tinca L.) to Potassium Nitrate Enriched Water,
W80-04387 5B

TERRAIN ANALYSIS
Application of Geomorphic Principles to Environmental Management in Semiarid Regions,
W80-04443 4D

TESTING PROCEDURES
Evaluation of Protocols for Pesticides and PCB's in Raw Wastewater,
W80-04300 5A

THALASSIOSIRA
A Comparison of the Acute Toxicities of Ten Heavy Metals to Phytoplankton from Saanich Inlet, B.C., Canada,
W80-04398 5C

THALLIUM
Toxicity of Heavy Metals to the Marine Diatom Ditylum Brightwellii (West) Grunow: Correlation Between Toxicity and Metal Speciation,
W80-04414 5A

THEORETICAL ANALYSIS
Application of Recent Results in Functional Analysis to the Problem of Water Tables,
W80-04214 2F

The Unsolved General Glacier Sliding Problem,
W80-04319 2C

THERMAL POLLUTION
Algal Response to a Thermal Effluent: Study of a Power Station on the Provo River, Utah, USA,
W80-04449 5C

THERMAL POWER PLANTS
Integration of Biological with Thermal Criteria for Power Plant Design and Water Resource Use,
W80-04289 5C

THREE-DIMENSIONAL FLOW
Three-Dimensional Seepage Through a Homogeneous Dam,
W80-04215 2F

TIDAL EFFECTS
Nutrient and Oxygen Redistribution During a Spring Neap Tidal Cycle in a Temperature Estuary,
W80-04212 2L

A New Technique for Measuring Tidal Currents by Using a Two-Site HF Doppler Radar System,
W80-04307 7B

TIDAL WATERS
A New Technique for Measuring Tidal Currents by Using a Two-Site HF Doppler Radar System,
W80-04307 7B

TINCA
Response of the Tench (Tinca Tinca L.) to Potassium Nitrate Enriched Water,
W80-04387 5B

TISSUE ANALYSIS
Response of the Tench (Tinca Tinca L.) to Potassium Nitrate Enriched Water,
W80-04387 5B

Interactions Between Vascular Actions of Detergent and Catecholamines in Perfused Gills of European Eel, Anguilla Anguilla L. and Brown Trout, Salmo Trutta, L.,
W80-04388 5A

Bioaccumulation and Bioamplification of Mercury Compounds in a Third Level Consumer, Salmo Gairdneri, Influence of the Temperature Factor (In French),
W80-04396 5B

Pesticide Residues in Lake Balaton,
W80-04402 5B

Effect of Some Pesticides on the Rhythmic Adductor Muscle Activity of Fresh-Water Mussel Larvae,
W80-04406 5A

Correlation Between Cadmium Concentration in the Water and Tissue Residue Levels in Dab, Limanda Limanda L., and Plaice, Pleuronectes Platessa L.,
W80-04407 5A

Seasonal and Environmental Variation in Mn, Fe, Cu and Zn Content of Spartina Alterniflora,
W80-04411 5A

Copper-The Major Metal Component of Glycerid Polychaete Jaws,
W80-04413 5B

Mercury in Water, Organisms and Sediments from a Section of the Turkish Mediterranean Coast,
W80-04417 5B

Chlorinated Hydrocarbons in Fish-Eating Birds from the Gdansk Bay, Baltic Sea,
W80-04419 5B

TOPOGRAPHY
The Spectral Power Density and Shadowing Function of a Glacial Microrelief at the Decimetre Scale,
W80-04317 2C

TOXICITY
The Acute Toxicity of Eleven Detergents to Fish: Results of an Interlaboratory Exercise,
W80-04341 5C

Response of the Tench (Tinca Tinca L.) to Potassium Nitrate Enriched Water,
W80-04387 5B

Interactions Between Vascular Actions of Detergent and Catecholamines in Perfused Gills of European Eel, Anguilla Anguilla L. and Brown Trout, Salmo Trutta, L.,
W80-04388 5A

Effects of Trace Metals on Growth of Yellow Perch (Perca Flavescens) as Measured by RNA-DNA Ratios,
W80-04390 5C

Effects of Chlorobrominated and Chlorinated Cooling Waters on Estuarine Organisms,
W80-04393 5C

Development and Survival of Embryos of Lake Herring at Different Constant Oxygen Concentrations and Temperatures,
W80-04394 5C

The Effect of Dissolved Oxygen and Salinity on the Toxicity of Ammonia to Smolts of Salmon, Salmo Salar L.,
W80-04397 5A

A Comparison of the Acute Toxicities of Ten Heavy Metals to Phytoplankton from Saanich Inlet, B.C., Canada,
W80-04398 5C

The Process of Fish Fauna Restoration in the River Pek Following the Catastrophic Outbreak of Gangue from the Copper Mines 'Majdanpek' in Yugoslavia,
W80-04400 5C

The Effects of Interacting Salinity, Cadmium, and Mercury on Population Growth of an Archiannelid, Dinophilus Gyrociliatus,
W80-04403 5A

Influence of Thermal Challenge on Conditioned Feeding Forays of Juvenile Rainbow Trout,
W80-04405 5C

Toxicity of Heavy Metals to the Marine Diatom Ditylum Brightwellii (West) Grunow: Correlation Between Toxicity and Metal Speciation,
W80-04414 5A

Mortality, Growth and Fecundity of Transplanted Mussel and Barnacle Populations Near a Pulp Mill Outfall,
W80-04418 5C

An Aquatic Safety Assessment on Linear Alkylbenzene Sulfonate (LAS): Chronic Effects on Fathead Minnows,
W80-04420 5A

TRACE ELEMENTS
Trace Elements in Monsoon Rains at Bombay and Over the Arabian Sea,
W80-04240 2K

TRACERS
Clostridium Perfringens as a Water Pollution Indicator,
W80-04247 5B

Estimation of Recharge to the Phreatic Aquifers of the Lower Maner Basin, India, by Using the Tritium Injection Method,
W80-04249 2F

Groundwater Transport of a Salt Tracer Through a Sandy Lakebed,
W80-04250 2A

Current C14 Methods for Measuring Primary Production: Gross Underestimates in Oceanic Waters,
W80-04284 5A

TRAJECTORIES
Oil Spill Trajectory Analysis Lower Cook Inlet, Alaska,
W80-04431 5C

TREES
Role of Tree-Ring Analysis and Related Studies in Palaeo-Climatology: Preliminary Survey and Scope for Indian Region,
W80-04241 2B

TRITIUM
Estimation of Recharge to the Phreatic Aquifers of the Lower Maner Basin, India, by Using the Tritium Injection Method,
W80-04249 2F

TROPHIC LEVEL
Subfossil Chironomids as Evidence of Eutrophication in Ekoln Bay, Central Sweden,
W80-04453 5C

A Compendium of Lake and Reservoir Data Collected by the National Eutrophication Survey in Eastern North-Central, and Southeastern United States.
W80-04458 5C

TROPICAL REGIONS
Role of Tree-Ring Analysis and Related Studies in Palaeo-Climatology: Preliminary Survey and Scope for Indian Region,
W80-04241 2B

The Seasonal Cycle of the Phytoplankton in the Coastal Waters of Ghana,
W80-04361 5C

TUNNEL CONSTRUCTION
Subglacial Constructions and Investigations at Bondhusbreen, Norway,
W80-04339 2C

TURBIDITY
Buffering of Silica and Phosphate in a Turbid River,
W80-04252 5B

TURKEY
Karstic Spring Recession Hydrograph and Water Temperature Analysis: Oymapinar Dam Project, Turkey,
W80-04234 2F

Mercury in Water, Organisms and Sediments from a Section of the Turkish Mediterranean Coast,
W80-04417 5B

ULTRAVIOLET RADIATION
Ultraviolet Radiation and Phytoplankton Photosynthesis,
W80-04462 5C

UNITED KINGDOM
The Acute Toxicity of Eleven Detergents to Fish: Results of an Interlaboratory Exercise,
W80-04341 5C

UNITED STATES
Jurisdictional and Administrative Limitations Affecting Management of the Halibut Fishery,
W80-04475 6E

Trans-Boundary Pollution Injuries: Jurisdictional Considerations in Private Litigation Between Canada and the United States,
W80-04481 6E

UNSTEADY FLOW
Approximate Flood Routing Methods: A Review,
W80-04208 2E

UPPER SANTA ANA RIVER BASIN (CALIF)
Ground-Water Quality in the Upper Santa Ana River Basin, Southern California,
W80-04383 5B

UPWELLING
The Seasonal Cycle of the Phytoplankton in the Coastal Waters of Ghana,
W80-04361 5C

URBAN RUNOFF
Urban Stormwater Management, Proceedings of a Southeast Regional Conference, North Carolina State University, April 10-11, 1979.

The California Water Atlas.
W80-04444 2A

National Water Quality Inventory 1976 Report to Congress.
W80-04459 5G

WATER QUALITY CONTROL
Nitrogen Fixation in a Nitrogen-Limited Impoundment,
W80-04360 5C

WATER QUALITY STANDARDS
Water Quality Committee-Annual Review of Significant Legislature, Judicial and Administrative, Activities During 1977.
W80-04472 6E

Water Quality Committee (Annual Review of Activities - 1975).
W80-04484 6E

Impact of the 1977 Clean Water Act Amendments on Industrial Dischargers,
W80-04487 6E

Federal Common Law: Judicially Established Effluent Standards as a Remedy in Federal Nuisance Actions,
W80-04499 6E

WATER REQUIREMENTS
The California Water Atlas.
W80-04444 2A

WATER RESOURCE PLANNING
Hierarchical-Multiobjective Approach in the Planning and Management of Water and Related Land Resources,
W80-04291 5G

WATER RESOURCES
Coordination of Overlapping Hierarchical Water Resources Systems,
W80-04292 6A

A Hierarchical Multiobjective Method for Water Resources Planning,
W80-04293 6A

Hydrologic and Geologic Data from the Upper East Coast Planning Area, Southeast Florida,
W80-04381 2F

The California Water Atlas.
W80-04444 2A

Toward the Maximization of a Resource: The 1971 Washington Water Resources Act,
W80-04480 6E

WATER RESOURCES DEVELOPMENT
Land and Water Resources Planning Using Goal Programming,
W80-04202 6A

The Potential for Developing Ground-Water Supplies in the Pescadero Area, San Mateo County, California,
W80-04384 6D

The Idaho Water Plan: Two Threshold Constitutional Problems and Suggested Solutions,
W80-04476 6E

An International Comparison of Trends in Water Resources Management,
W80-04498 6E

WATER SAMPLING
A Simple Tubular Phytoplankton Sampler for Vertical Profiling in Lakes,
W80-04344 7B

WATER SOURCES
Conjunctive Water Use,
W80-04429 4B

WATER SUPPLY
The Potential for Developing Ground-Water Supplies in the Pescadero Area, San Mateo County, California,
W80-04384 6D

Hydrologic and Related Data for Water-Supply Planning in an Intensive-Study Area, Northeastern Wichita County, Kansas,
W80-04385 4B

The California Water Atlas.
W80-04444 2A

WATER TABLE
Application of Recent Results in Functional Analysis to the Problem of Water Tables,
W80-04214 2F

WATER TABLE AQUIFERS
Estimation of Recharge to the Phreatic Aquifers of the Lower Maner Basin, India, by Using the Tritium Injection Method,
W80-04249 2F

WATER TEMPERATURE
Improvement of the Quality of Waste Pond Effluents in Northern Areas by Chemical Pre-Precipitation,
W80-04287 5D

Development and Survival of Embryos of Lake Herring at Different Constant Oxygen Concentrations and Temperatures,
W80-04394 5C

Influence of Thermal Challenge on Conditioned Feeding Forays of Juvenile Rainbow Trout,
W80-04405 5C

WATER WELLS
The Sea-Water Well System at the Fisheries Laboratory, Lowestoft and the Methods in Use for Keeping Marine Fish,
W80-04415 5A

Down Easters Head for the Bedrock.
W80-04434 8A

Percussion Drilling Technologies,
W80-04435 8A

Large Diameter Shallow Wells.
W80-04473 8A

WATER YIELD
Land Capability for Surface Water Production,
W80-04257 4A

Yield and Macronutrient Content of Water in Relation to Plant Cover from the Snow Tussock Grassland Zone of Eastern and Central Otago, New Zealand,
W80-04260 2A

Hydrogeologic Features of the Alluvial Deposits in the Nowood River Drainage Area, Bighorn Basin, Wyoming,
W80-04382 2F

WATERSHED (BASINS)
Characterization and Models of Watershed Storage,
W80-04233 2E

WATERSHED STORAGE
Characterization and Models of Watershed Storage,
W80-04233 2E

WATERSHEDS (BASINS)
Runoff Curve Numbers from Partial Area Watersheds,
W80-04207 2E

Rural Nonpoint Source Water Quality in a Southeastern Watershed,
W80-04221 5B

Feasibility of Water Quality Improvement in Three Illinois Rivers,
W80-04246 5B

Modelling and Analysis of Data from Catchment Studies of Land Use Change,
W80-04254 2A

WATSTORE
A Proposed Ground Water Quality Monitoring Network for Idaho,
W80-04374 7A

WAVES (WATER)
Coupling of Internal Wave Motion with Entrainment at the Density Interface of a Two-Layer Lake,
W80-04209 2H

WEATHER FORECASTING
Don't Let Politics Proscribe Climatic Research,
W80-04470 6E

WELL DATA
Hydrologic Data for the Morris Bridge Well-Field Area, Hillsborough County, Florida, 1971-78,
W80-04372 2F

WESTERN KANSAS
Evaluation of Methods for Estimating Ground-Water Withdrawals in Western Kansas,
W80-04370 4B

WESTERN U.S.
Acid Precipitation in the Western United States,
W80-04213 2K

WETLANDS
Classification of Wetlands and Deepwater Habitats of the United States,
W80-04301 6B

The Influence of Thick Floating Vegetation (Water Hyacinth: Eichhornia Crassipes) on the Physico-Chemical Environment of a Fresh Water Wetland,
